Prior literature examining the impact of Internships on participants has identified a range of positive aspects that are implicitly related to workplace competencies (for example, see: Maertz et al., 2014; Rosenberg et al., 2012; Smith and Worsfold, 2015), and employability (for example, see: Hergert, 2009; Rothman and Sisman, 2016), or both (for example, see: Bayerlein, 2015, 2020; Jackson, 2015). However, much of the prior literature has either used the concepts of workplace competencies and employability interchangeably, or been unclear about the conceptual lens(es) employed. While this lack of clarity about the intention(s) and conceptual lens(es) that underpin an individual Internship experience does not detract from the highly positive and far reaching impacts of Internships in general (Hergert, 2009), both research and practice are likely to benefit from a clear identification of the conceptual underpinnings and intentions of individual Internships.

Internships may, in principle, be divided into (1) experiences that transition participants into specific employment opportunities through the development of role-specific employability skills (Gardner and Liu, 1997), and (2) experiences that develop participants general/transferable workplace competencies (Prikshtat et al., 2018, 2019). Employability focused Internships are likely to be most successful if their learning outcomes are closely aligned with the requirements of a particular employment opportunity (Gardner and Liu, 1997), employer organization or industry. Practical participant benefits arising from employability focused Internships include the application of theoretical knowledge in specific practical settings (Bayerlein, 2015, 2020), increased employment opportunities (Hergert, 2009), and opportunities for participants to self-assess their suitability for their chosen career (Rothman and Sisman, 2016).

Workplace-competency focused Internships are likely to be most successful if their learning outcomes are focused on the integrated development of transferable competencies that are critically important in contemporary, as well as future, workplaces (Prikshtat et al., 2019). This focus differs from employability based Internships because it distinguishes the development of competencies, and the ability to consistently apply the developed competencies at a required level, from the context in which competencies are developed, practiced and assessed (Prikshtat et al., 2019). As a result, the learning outcomes of workplace-competency based Internships, such as problem solving, communication skills and workplace agility, arise out of identified, and agree-upon, transferable

skills, with their contextualized application being reflective of the specific environment, but not the learning outcomes, in which a specific Internship experience is situated.

The different mechanisms through which the impact of employability based and workplace-competency based Internships is created are also important from an experience design and assurance perspective. When designing (for example see: [Wiggins and McTighe, 1998](#)) or assuring (for example, see: [Biggs, 1996](#)) learning, the identification the specific learning outcomes to be achieved should act as the starting point for all future decisions. For employability-based Internships, such learning outcomes are likely to be based on (1) the needs of an individual employer organization or industry, and (2) the participants demonstrated ability to meet those needs. This focus, in turn, implies that learning outcomes are dictated by the workplace context in which the Internship occurs. For workplace-competency based Internships, learning outcomes are likely to be created through (1) the skills and knowledge that participants must possess to be successful in a variety of workplaces, and (2) the participants demonstrated ability to apply these skills and knowledge in one or more practical contexts. This focus, in turn, implies that learning outcomes are dictated by beliefs about transferable conceptual workplace skills, and that the context in which these skills are developed, applied and assessed is secondary to the participants learning.

Contextual changes impacting internships

Providers of education have a strong incentive to increase the volume and quality of Internship opportunities for participants ([Jackson et al., 2017](#)). At the same time, the breadth of Internship experiences available to participants is growing to meet the increasingly fragmented and specific needs of participants, education providers and placement providers ([Kay et al., 2019](#); [Kraft et al., 2019](#)). An important reason for the changing nature of Internships are the structural changes occurring in the world-of-work ([Bayerlein et al., 2021a](#)). Workplaces world-wide are undergoing a rapid transition toward technology-based structures, and it important that Internships, as well as Work-Integrated Learning activities in general, continue to evolve to reflect contemporary workplace requirements and practices ([Dean and Campbell, 2020](#)).

Two important workplace trends that create an immediate impact on Internships are the increasing application of, and reliance on, technology across virtually all workplaces ([Bayerlein et al., 2021a](#)), as well as the growing importance of transferable professional skills to meet increasingly generalist workplace expectations ([Hite and McDonald, 2020](#)). Although both trends have impacted workplaces for some time, the COVID-19 pandemic has changed the previously slow transition process into a rapid adoption activity ([Carroll and Conboy, 2020](#); [Bayerlein et al., 2021a](#)). Literature suggests that the COVID-19 pandemic will have long-term impacts on society ([Sneader and Singhal, 2020](#)), as well as workplaces and employment ([Hite and McDonald, 2020](#); [Yawson, 2020](#)). Of particular concern for Internships is emerging evidence that many of the workplace changes, including technology based workplace changes, caused by the COVID-19 pandemic are likely to persist into the future ([Yawson, 2020](#)).

Internships are well suited to prepare participants for emerging workplace structures and requirements because they embed participants into current workplace practices ([Jackson et al., 2017](#)). It is likely that the relative importance of Internships for education providers, Internship participants and Internship providers increases because providers of education have historically found the development of curricula focused on future workplace-competencies difficult ([Bayerlein et al., 2021a](#)). The increasing implementation of Internships in education programs addresses this concern by enabling participants to develop the skills, knowledge and competencies that are required in contemporary, as well as emerging, workplaces ([Dean and Campbell, 2020](#)) without the need to undertake extensive changes within the remaining educational curriculum.

Emergence of technology-based internships

The structures, processes and arrangements underpinning modern workplaces are in a constant state of change. Traditionally, the implementation of changes, including the uptake of technology as the basis upon which workplaces are organized, has been relatively slow. However, the COVID-19 pandemic has accelerated the rate of change, and in particular the rate of technology adoption across virtually all workplaces. The impact of this rapid (for example, see: [Carroll and Conboy, 2020](#)) and persistent (for example, see: [Yawson, 2020](#)) change of workplace arrangements is well captured by the application of the technology use continuum of [Schuster and Glavas \(2017\)](#).

[Schuster and Glavas \(2017\)](#) posit that technology application within a workplace falls within four broad categories: *technology-supported*, *technology-facilitated*, *technology-blended*, and *technology-based*. Workplaces generally have been transitioning from the lower technology reliance categories (technology-supported and technology-facilitated) to higher technology reliance categories (technology-blended and technology-based) for some time ([Bayerlein et al., 2021a](#)). This shift of workplace arrangements along the [Schuster and Glavas \(2017\)](#) technology use continuum impacts the skills, knowledge and competencies required in contemporary and emerging workplaces, and it increases the importance of appropriate technology use in all facets of future Internship arrangements ([Bayerlein et al., 2021a](#)).

The rate with which emerging technologies have been adopted in education generally ([Alexander et al., 2019](#)), and in the delivery of technology enabled Internships and Work-Integrated Learning programs specifically ([Kay et al., 2019](#)), has historically been relatively slow ([Bayerlein et al., 2021b](#)). Despite the relatively slow adoption rate, technology application in Internship arrangements have generally mirrored wider changes in the way workplaces are organized (for example, see: [Bayerlein et al., 2021a](#)), and technology-blended or technology-based Internships have become normalized ([Bayerlein et al., 2021b](#)). While the

world-wide impact of the COVID-19 pandemic has undoubtedly accelerated (Carroll and Conboy, 2020) the transition of Internships along the technology use continuum of Schuster and Glavas (2017), technology-based Internships have been recognized as a discrete Internship formats for some time (Van Dorp, 2008; Jeske and Axtell, 2014, 2016, 2018).

The adoption of technology in Internships has followed a similar trajectory to the technology adoption across workplaces generally, with Internships initially exhibiting features aligned with the technology-supported, technology-facilitated, and technology-blended categories of Schuster and Glavas (2017). The more recent transition to technology-based Internships, reflects a new level of technology use because the activities and learning outcomes of Internships, as well as the mechanisms to support and evaluate participant learning outcomes, are deliberately and entirely reliant on the application of technology (Jeske and Axtell, 2018).

The potential learning outcomes of technology-based Internships are similar to those of traditional Internships (Bayerlein et al., 2021b; Zegwaard and Rowe, 2019), because in both instances, learning outcomes are reliant on the meaningful, and structured, integration of a participant learning experience within a workplace context (Bayerlein and Jeske, 2018b). While the learning activities and support structures that are available in traditional and technology-based Internships differ, the cognitive, skill-based and affective psychological development outcomes (Kraiger et al., 1993) that are attainable in both settings are largely comparable (Bayerlein and Jeske, 2018b). In addition, technology-based Internships have the potential to reduce the accessibility (Bayerlein et al., 2021b, Kraft et al., 2019, Bayerlein and Jeske, 2018a; Kay et al., 2019) and resource allocation barriers (Irwin et al., 2012) of Internships considerably.

Expansion of internships to Work-Integrated Learning

The nature of contemporary workplaces is changing rapidly and permanently. While the adoption of technology across virtually all workplaces is one important source of change, the increasing generalist nature of workplaces (Hite and McDonald, 2020) represents another macro trend. The changing nature of workplaces, in turn, requires workplace participants to develop skills and knowledge that are substantially different from those required in traditional workplaces (Bayerlein et al., 2021a).

Changes between traditional workplaces and emerging workplaces are particularly pronounced in areas such as personal development, knowledge acquisition, and the development of workplace cultures (Bayerlein et al., 2021a). The changing nature of workplaces impacts these skill and knowledge areas because their development and application is largely socially constructed (Hora et al., 2018, 2019). In traditional Internships, the integration of participants into the social environment that surrounds their work and learning experience (Konradt and Schmook, 1999) enables the attainment of socially constructed learning outcomes that are specific to the placement setting. Technology-based Internships are principally able to achieve comparable outcomes, because both Internship modes are conceptually based on the notion of employability (Gardner and Liu, 1997), rather than the notion of workplace competencies (Prikshat et al., 2019).

Work-Integrated Learning represents a wide field of workplace-based learning activities that encompasses Internships as well as a range of well-established and emerging learning activities. Work-Integrated Learning is based on well-established frameworks and concepts (Kay et al., 2019), but the delivery mechanisms used to achieve learning outcomes for students have changed substantially in recent years. Changes to Work-Integrated Learning are the result of the changing nature of work, as well as the growing demand for learning activities that align participant experiences with the workplace competencies required in emerging workplaces (Bayerlein et al., 2021a,b; Dean and Campbell, 2020). Of particular note in this area are technology-based Work-Integrated Learning activities that enable a focus on the development of transferable workplace-competencies. Examples of such activities include simulated Internship experiences (for example, see: Bayerlein, 2015) or digital service learning (Perkiss et al., 2020), which combines the traditional notion of service learning as a learning activity that provides a service to a particular community, or society at large, with a technology-based, location un-bounded, learning environment. New forms of Work-Integrated Learning, such as digital service learning, are aligned with many facets of traditional Internships because participants develop a critical understanding of the context and substance of a problem, and develop professional judgment and reflective capabilities as part of the activity (Perkiss et al., 2019; Wersun et al., 2019; Dean et al., 2018). Simulated Internships are more closely aligned with traditional, as well as technology-based, Internship arrangement because the conceptual idea of a work-placement is retained (Bayerlein, 2015), and some of the challenges associated with traditional internships are also present in technology-based internship arrangements (Bayerlein, 2020). However, the ability to focus participant learning experiences and outcomes on workplace competencies that are critically important for industries or professions generally, rather than the learning activities and outcomes that can be attained within a particular placement, provides additional flexibility for education providers and participants.

Recommendations for future internship developments

Changes in the structure and technology use in virtually all workplaces have gathered momentum during the COVID-19 pandemic (Bayerlein et al., 2021a). While the challenges associated with the resulting workplace changes and career disruptions are not new (for example, see: Mishra and McDonald, 2017), ongoing structural changes to workplaces increase the importance of transferable generalist skills and competencies for existing and future workforce participants (Bayerlein et al., 2021a). In practice, this means that future workplaces are likely to become more generalist in nature, and workplace participants are likely to require a greater resilience to change (Hite and McDonald, 2020). Given that education providers are exposed to long-standing pressures from governments and employer organizations to ensure graduates meet a growing number of workplace-competence and employability criteria,

changes to education programs are required. This work has positioned Internships, and Work-Integrated Learning activities more generally, as one educational experience that is well suited to address these needs (also, see: [Bayerlein et al., 2021b](#)).

Internships, and Work-Integrated Learning more generally, allow education providers to extend existing curricula to prepare graduates for emerging workplaces. However, in order to achieve this outcome Internships are required to adapt to changes in (emerging) workplace environments to ensure that the skill and knowledge development of participants is aligned with workplace macro-trends. In addition, the systematic application of learning design (for example, see: [Wiggins and McTighe, 1998](#)) and assurance of learning (for example, see: [Biggs, 1996](#); [Vitale et al., 2020](#)) principles in Internships is likely to necessitate a re-development of traditional Internship structures, processes and learning activities to ensure alignment between Internship learning activities, Internship learning outcome and the workplace competencies expected by employers and the society at large.

Three macro-trends that are likely to impact future Internship arrangements substantially are (1) the proliferation of technology-based ways of working ([Bayerlein et al., 2021a](#)), (2) the opportunities for Internships participants and Internship providers that arise from a reduction of Internship participation barriers ([Kay et al., 2019](#); [Kraft et al., 2019](#)), and (3) the growing focus on transferable, and increasingly generalist, workplace-readiness competencies over employer specific, or employment opportunity specific, employability skills ([Bayerlein et al., 2021a](#)).

Preparing participants for technology-based workplaces

The increasing uptake of technology-based distributed work arrangements across workplaces world-wide ([Bayerlein et al., 2021a](#)), as well as the associated growth in technology-based Internship arrangements, places additional burdens and responsibilities on employees as well as Internship participants ([Anderson, 2020](#)). Within Internships, additional challenges for participants arise because technology-based distributed work arrangements require them to work independently ([Xu and Tracey, 2014](#)), and to develop personality traits that are critically important for successful online learning (for example, see: [Xiao, 2012](#)). Education providers must recognize these challenges in their overall curriculum structures, and ensure that participants are adequately prepared for technology-based internship environments, as well as technology-based workplaces in general.

The implementation of technology-based distributed Internships is likely to require collaborative efforts from education providers and placement providers. Such collaborations are necessary because providers of education may find the development and implementation of technology-based Internship solutions challenging (for example, see: [Anderson, 2020](#); [Dean and Campbell, 2020](#)). Challenges arise due to the limited experience of participants and education provider staff in organizing and implementing technology-based learning activities. Many placement providers, on the other hand, developed extensive technology-based remote-working processes and support structures during the COVID-19 pandemic ([De et al., 2020](#)), and the knowledge gained from these experiences is now available to support technology-based Internships. Providers of education are able to contribute their expertise in the scaffolded development of distance learning skills to technology-based and distributed Internships, and technology-based Internships are likely to be most successful for participants if education providers and placement providers collaborate in the design and implementation of the experience.

The identification of clear learning outcomes, support structures and learning outcome assurance activities is critically important for all Internships ([Jackson, 2015](#)). In technology-based Internships, the identification of explicit mechanisms through which participant learning outcomes are achieved, and the structures through which placement and education providers support participants in attaining the identified outcomes, is even more critical because traditional Internship support structures are largely unavailable in technology-based Internships ([Bayerlein and Jeske, 2018b](#)).

One potential challenge for technology-based Internships, and technology-based Work-Integrated Learning activities generally, is the historically low level of acceptance for such learning experiences by employers and providers of education ([Bayerlein and Jeske, 2018b](#)). While empirical post-pandemic evidence of the acceptance of technology-based workplace learning activities is not yet available, it appears likely that the COVID-19 pandemic may have changed the perceptions of employers, and education providers considerably.

Reducing participation barriers

Future Internship developments should explicitly consider structures and delivery modes that improve participation opportunities for societal groups that have previously found it difficult to engage with, or participate in, Internship activities ([Kay et al., 2019](#)). A continued focus on traditional—location-bounded—internships could inadvertently limit participation opportunities of societal groups with additional needs ([Bayerlein and Jeske, 2018a](#); [Kraft et al., 2019](#)), family or care-giving commitments ([Bayerlein and Jeske, 2018a](#)), or other factors preventing attendance at a specific internship location ([Moore et al., 2015](#)).

Two internship developments that are likely to improve participation opportunities are technology-based Internships, as well as the transition of workplace-based learning away from narrowly defined Internships, and toward a wider range of Work-Integrated Learning activities. While neither of these developments were explicitly designed to reduce participation barriers for specific participants or occupations, their application should, in principle, lead to positive impacts for participants and employer organization alike (for example, see: [Kraft et al., 2019](#)). Despite early evidence about the potential impact of these developments for participants and internship providers, empirical assessments of this impact are still largely absent from the literature.

Focusing experiences on workplace-readiness competencies

Internships, and Work-Integrated Learning activities generally, should enable participants to develop the skills and knowledge that are necessary to meet the demands of increasingly complex and constantly changing workplaces. To meet these demands, it is recommended that future workplace based learning activities should aim to develop participants integrated workplace-readiness competencies (Prikshtat et al., 2019), rather than more context specific employability requirements (Gardner and Liu, 1997).

Workplace competencies focused Internships, and Work Integrated Learning activities more generally, are likely to meet the demand for increasingly diverse (Kay et al., 2019) and generalist (Hite and McDonald, 2020) learning outcomes. However, a focus on activities that preference workplace-readiness competencies over employability may also result in a further decrease in the networking opportunities and employment prospects that are important features of traditional internships. Given the growing overall demand for Internships, it appears likely that Internships with different learning outcome focus areas will emerge. While such a diversification of learning opportunities has clear benefits for all stakeholders, the success of individual workplace-based learning activities is likely to depend on the clear identification and communication of learning outcomes available in each Internship (Jackson, 2015). Without clearly identified and communicated learning outcomes, increasing Internship diversity is unlikely to be beneficial for participants or internship providers.

Career pathways in the international context

The focus of education on preparing workers to enter employment and progress in careers is a global concern. Rooted in long histories of vocational education and training (VET) that vary from country to country, systems and programs of career pathways through education and to employment are changing worldwide. Virtually all VET prepares graduates for employment but how this is done varies widely in the emphasis on vocational knowledge and skills relative to general education, the methods of delivery of VET systems and programs, and the emphasis placed on preparing youths to enter employment versus adults already in the workforce. VET systems also vary in their intentionality to meet the education and employment needs of populations with low participation rates in postsecondary education, further marginalizing them from professional employment that garners higher income and social mobility (Bathmaker, 2015).

Typically under the auspices of VET, the formulation of career pathways systems and programs also depends on past and present governmental policies and labor market economies. Wheelahan and Moodie (2017) assessed the patterns of relationships between education and employment in different national contexts to understand changes made to improve VET that have implications for how career pathway systems and programs are evolving worldwide. Their analysis shows Germany and the Scandinavian countries have market economies that coordinate VET through national and regional governmental policies, as well as business and labor that also exert strong influence. This approach to VET results in preparation for employment that follows distinct postsecondary education tracks that matches graduates to job vacancies. Because these countries have relatively stable labor markets, employers and employees are incentivized to invest in VET, including playing strong roles in identifying the qualifications for occupations they need to fill. As a result, these coordinated systems of VET give reliable signals to employers of the competencies graduates need to hold to enter and advance in employment. Similarly, graduates are assured that their investment in VET will lead to predictable employment, and sometimes also career progression.

In contrast, Anglophone countries with liberal market economies rely more heavily on labor markets and employers to match graduates and employment, without direct connections to or influence on education. Ironically, Wheelahan and Moodie (2017) argue VET in these economies tends to place higher priority on occupational-specific competencies or skills than northern European countries because the limited engagement of employers in these countries weakens their understanding that what is taught as relevant to the jobs they need to fill, and further reduces their commitment to hiring graduates. As a result, the cost of VET in these countries is born heavily by students rather than business and industry, except to the extent employers provide varying levels of training for entry-level workers.

One goal of career pathways systems and programs is to close this gap between education and employment by incentivizing governments, educational institutions, employers, and labor to work together to improve the alignment of academic and occupational knowledge and skills with employment. A common outcome of these efforts is a set of qualifications, including credentials, used to articulate more clearly what career pathways are attempting to do to prepare graduates for work. Though well intentioned, Wheelahan and Moodie point out tensions exist in countries with liberal market economies that adopt competency-based qualifications for specific jobs concerning their emphasis on general and academic education. Some educational experts observe the blurring of academic and vocational education to de-emphasize tracking, seen in Anglophone countries such as Australia, Canada, and the United Kingdom, emphasizes a more democratic form of education while other experts suggest the ambiguity in education characterizing these nations contributes to inequitable outcomes, further marginalizing racially minoritized and low-income populations. Contributing to this latter perspective is research suggesting students in Anglophone countries are less certain of the value of the qualifications than in countries that coordinate VET and employers and also that employers in these countries are less likely to see VET as a reliable signal that graduates are prepared for employment (Moodie, 2008).

Looking more deeply at the development of career pathways in Anglophone countries, we see the emergence of higher vocational education (HIVE). Policy and programmatic changes to VET in these countries include growing recognition that the knowledge and skills needed to work in the global economy require knowledge and skills offered by higher education. These arguments for career

pathways systems and programs also recognize the importance of providing education beyond compulsory age for underserved students who are far less likely to attend college and secure well-paying employment as a result of their education than students from more privileged backgrounds (Webb et al., 2017). Although, while VET systems in northern European countries are creating more options for students to participate in post-compulsory education (McKay et al., 2021) these systems continue to perpetuate differences in upward social mobility (Protsch and Solga, 2016).

The question of alignment between VET and employment has been especially active in Anglophile countries over the last decade or more, due to the loose coordination of education and employment. For example, that Australia and Canada provide limited alignment between VET, employment in specific industry sectors, and the labor market has been the subject of research by Wheelahan and Moodie (2017, p. 11). This study concluded graduates have diminished potential to secure well-paying jobs “when ‘skills mismatches’ between credentials and occupations are widespread.” Also, because governments of Anglophile countries tend not to intervene in liberal market economies, VET operates less effectively to match graduates to employment than in northern European countries. Due to longstanding policies and deeply rooted structures that produce mixed results, various reforms intended to improve VET, including career pathways systems and programs, are being pursued in almost all countries. Common features pervade these reforms according to Keating et al. (2002) who studied VET systems in nine countries. These similarities include:

- VET reform is the focus of more national governments.
- VET and general education are becoming increasingly more integrated.
- VET departments are becoming more integrated to broaden employment options.
- VET programs are broadening curriculum to include “soft” skills, core competencies, and related knowledge.
- VET is under pressure to cut costs.
- VET policy and funding is increasingly driven by industry and labor market demand than by governments.
- VET tends to be experimenting with developing education and training markets.
- VET has not been seen as sufficiently client-focused.
- VET has developed and continues to exist as an alternative to higher-status academic pathways.

Career pathways in the United States

Career pathways in the United States integrate secondary education and/or adult basic education (ABE) with workforce training and postsecondary education to help transition youths and adults into living wage employment and careers (U.S. Department of Education, 2015). Career pathway students prepare to enter and advance by mastering competencies aligned with industry-recognized and -college credentials, including associates and baccalaureate degrees (Bragg et al., 2019). By better integrating career pathway systems and programs more closely with the labor market, occupational preparation is expected to be more efficient, effective and equitable. Also, by sequencing competencies and credentials, student outcomes are expected to improve for diverse learners from the time they enter employment through their working lives.

Whereas career pathways are theorized to benefit all students in some way, this approach is thought most transformative for student populations who have been underserved by postsecondary education. By easing the transition into college and better aligning postsecondary studies with the labor market, career pathways are expected to enhance social mobility for students who have experienced barriers to postsecondary education participation. In the US where racially minoritized groups have been tracked away from course taking required to access and successfully navigate college attendance (Domina et al., 2019), career pathway systems and programs are expected to help improve student outcomes. Racially minoritized and other underserved populations are prepared for academic as well as vocational requirements to succeed in postsecondary education.

In the US, career pathways systems and programs prepare youths rising from high school to college and adults marginalized from postsecondary education and good jobs to enter living wage employment and advance in careers (Durham and Bragg, 2019; Sama and Strawn, 2018). By designing career pathways for youths and adults, this comprehensive approach to occupational preparation is thought to optimize opportunities for individuals to secure the qualifications needed for well-paying employment (Alssid et al., 2002; Hedge and Carter, 2020). This argument for career pathways is rooted in a belief that liberal economies such as the US and Anglophile countries with historically weak connections between education and the labor market need to strengthen these connections to assist more graduates to secure good jobs (Wheelahan and Moodie, 2017). Career pathways are especially keen on addressing this problem for students who have been underserved by postsecondary education. Students who are racially minoritized, first-generation college, immigrants and English Language Learners (ELL), individuals already working in low-wage and essential jobs, and other groups with limited resources to attend college are a primary target audience of career pathways.

Positioned as the gateway to postsecondary education in the US, community colleges are often designated as a preferred provider of career pathways because of their open-access mission, historic commitment to occupational preparation, and strengthening relationships with public workforce training (Eyster, 2020). Situated between high schools and universities, community colleges offer 2 years of full-time postsecondary study to prepare graduates for credentials leading up to the associates degree and increasingly baccalaureate degrees in occupational fields requiring these credentials. Community colleges also prepare students to transfer to

universities where they complete two more years of study to secure baccalaureate degrees. The option to exit postsecondary education to obtain employment is possible with any of these options but most optimal when students earn credentials recognized by employers as well aligned to jobs that need to be filled (Carnevale et al., 2020). Besides working with employers and public workforce training, community colleges may also work with K-12 (kindergarten through grade 12) education, community-based organizations and other social services agencies to design and deliver career pathways addressing local and regional economic and social needs (Jacobs and Worth, 2019).

The heuristic of ladders or lattices that enable students to advance from K-12 education or ABE to postsecondary education is a common feature of career pathways (Herhusky and Ludwin, 2021). By improving the alignment of curriculum and instruction leading to credentials (certificates, licensures and degrees), graduates are expected to secure knowledge and skills needed for well-paying jobs that lead to career advancement (Sarna and Strawn, 2018). Careful mapping of knowledge and skill requirements to credentials enables graduates to enter and advance in industry sectors such as healthcare, manufacturing, and information technology. Wheelahan and Moodie (2017) observe qualifications associated with career pathways operate as signals or screens to employers who seek to hire qualified workers. Signals are strongest in regulated occupations such as nursing, engineering, and teaching, and weakest in unregulated occupations associated with management, retail and the service sector.

Considerable debate appears in literature in the US and internationally about whether the credentials associated with career pathways actually lead to well-paying jobs. Advocates argue credentials offered through career pathways, including short-term training offered at relatively low-cost, expedite employment that is needed to secure income needed to continue education and advance in careers. However, more tangible evidence is sought to understand how credentials associated with career pathways benefit underserved populations any better than past efforts to enhance social mobility for racially minoritized and low-income students (Ositelu et al., 2021).

Career pathways models and approaches

Federal and state governments in the US have increased the public investment in career pathways over the last two decades but large-scale investments have also been made by states and philanthropic organizations (Bragg, 2015). This mix of public and private funding has played a substantial role in scaling up career pathway models across the US. These models are voluminous, so I have chosen to discuss two models targeting youths and two focusing on adults that are widely known and implemented. Targeting youths are the Pathways to Prosperity and New Skills for Youth (NSYF) models, and targeting adults are the Integrated Basic Education Skills Training (I-BEST) and Accelerating Opportunity (AO) models.

Pathways to Prosperity Network (PPN) was championed by Harvard University faculty and collaborators who theorized career pathways are needed to fill the middle-skills gap and address inequalities in education and employment in the US (Schwartz, 2016). This effort has been funded by numerous philanthropies to support leaders in 10 states (Arizona, California, Delaware, Hawaii, Illinois, Minnesota, New York, Ohio, Tennessee, and Texas) to establish career pathways for youths in grades 9–14. High-skill, high-demand (HSHD) sectors such as healthcare, manufacturing, and information technology are prioritized and expected to provide youths with competencies and credentials to secure well-paying employment without closing off postsecondary education options, which has been a limitation of some forms of vocational education in the US. A key goal of PPN is to integrate college and career options and create statewide career pathway systems that reach at least 40% of grade 9–14 students. Recognizing challenges to expanding career pathways to large numbers of US youths, this model advocates for enhanced employer engagement. Intentionally replicating elements of Switzerland's VET system, PPN recommends a common set of standards to guide the development of career pathways similar to the Swiss VET model. Community colleges are seen as the most logical postsecondary partner to anchor career pathways for youths, and states adopting PPN model are encouraged to reform VET [called career and technical education (CTE)] in the US into career pathways systems and programs.

New Skills for Youth (NSYF) is a multi-million investment by JPMorgan Chase and Company in career pathways for youths in 10 states (Delaware, Kentucky, Louisiana, Massachusetts, Nevada, Ohio, Oklahoma, Rhode Island, Tennessee, and Wisconsin). [Note, three of these states are also engaged in PPN (Delaware, Ohio, and Tennessee).] Over the last 6 years these states have built on existing CTE programs, including utilizing federal and state funding to enhance youth transition from secondary to postsecondary education that leads to employment in healthcare and manufacturing (Staklis et al., 2020). Recognizing widening inequalities, NSYF attempted to improve programs for underserved youths through improved partnerships with employers, enhanced postsecondary and workforce connections, and strengthened accountability systems. However, the completion rates of students participating in career pathways created through NSYF rose only modestly, from 12% in 2015–16 to 18% in 2018–19. Undeterred from its long-term investment, JPMorgan Chase recently announced it would continue to support career pathways and disseminate lessons learned to a larger audience of K-12 education (JPMorgan Chase and Co, 2020).

Turning our attention to adults, a plethora of career pathway models and approaches have evolved over the last two decades. The Integrated Basic Education and Skills Training (I-BEST) model is one of the most well-known and foundational to other adult-facing career pathways models and approaches in the US (Eyster, 2020). Developed by the Washington State Board of Community and Technical Colleges (SBCTC), with funding from the state and the Bill & Melinda Gates Foundation, I-BEST is a structured model for integrating CTE and contextualized basic skills primarily targeting adults who have not completed a formal high school diploma. I-BEST relies on the co-teaching of technical content, literacy and other content by pairing CTE and basic skills instructors. Supplemental instruction and comprehensive student support help adults secure the GED and enter postsecondary to secure credentials

and eventually employment in industry sectors offering well-paying jobs. Early evaluation of I-BEST from 2005–2006 to 2007–2008 found student participation had a positive relationship to earning college credit and a certificate or degree and achieving point gains on basic skills exams (Wachen et al., 2012). Later analysis showed the intention to treat students with I-BEST revealed a positive causal relationship between I-BEST and many of the same student outcomes evaluated by Wachen et al. (Zeidenberg et al., 2010).

Finally, a national initiative called Accelerating Opportunity (AO) evolved from the I-BEST model to provide adults, as well as underserved youths, with career pathways offered by community colleges. Taking lessons from the Breaking Through initiative as well as I-BEST (Anderson et al., 2017), AO allowed students scoring in the 6th-through 12th-grade functioning levels of National Reporting System to enroll in CTE courses concurrently with high school equivalency completion programs, including the GED. Career pathways offered courses and stackable, industry-recognized credentials within roughly 12 college credit hours. Team teaching patterned off the I-BEST model, amounting to at least 25% of college classes, as well as contextualized and accelerated instruction, support services, and connections with employers and workforce agencies are integral to the AO model. Rigorous research designs to track student outcomes through 12 quarters of initial enrollment found AO had a positive impact on the number of college-awarded credentials earned by almost all students (Anderson et al., 2017). In most cases, AO students earned more credentials than comparison students while taking fewer college credits, possibly indicating more efficient course-taking through accelerated instruction. However, other student outcomes varied by the states, reflecting differences in student populations, career pathway interventions, and regional economies where the programs were offered.

Federal investment in career pathways in the US

Federal investment in career pathways systems and programs has grown in the US over the last two decades (Mortrude, 2018). Twelve federal agencies signed on to a common definition of career pathways by 2012, moving federal leadership toward a shared commitment to integrated postsecondary education and workforce training for youths and adults. Federal agencies also initiated funding for career pathways systems and programs, as well as research on career pathways (United States Department of Education, Office of Vocational and Adult Education, 2012). These projects included large-scale evaluations funded by the USDOL, USDOEd, and USHHS. The USDOL and USDOEd also worked together to develop tools and information about career pathways, emphasizing cross-agency partnerships, employer engagement in HSHD industry sectors, funding and capacity-building resources; aligned public policies and delivery systems; and evaluation of system change, program and student outcomes (Bragg, 2015; Eyster, 2020).

These leadership and funding efforts by the federal government also served as models for state and local investments through ongoing federal sources such as the Workforce Investment and Opportunity Act (WIOA) and the Strengthening of Career & Technical Education for 21st Century Act. The braiding of federal, state and other funding was recommended to develop and implement career pathways and recruit students who could benefit from participation in these programs. Along with other key components of career pathways, the notion of bridging students from one system to another, for example, ABE to community college, is an important feature of career pathways funded through federal and state policy.

Following this trajectory of government support, one federal law shaped local implementation of career pathways on a particularly major way. Created during President Obama's administration, the Trade Adjustment Assistance Community College and Career Training (TAACCCT) grant program awarded grants to higher education institutions, primarily community colleges, to help address the severe unemployment and economic ramifications of the Great Recession. TAACCCT is arguably the most expansive federal law passed thus far supporting community colleges to reform and anchor career pathways systems and programs at the postsecondary education level (Bragg et al., 2019; McKay and Van Noy, 2021).

Between 2011 and 2018, the DOL funded 256 grants totaling nearly \$2 billion through four rounds of competition for the TAACCCT grant program. These grants were awarded to 630 (of approximately 1000) community and technical colleges across all 50 states, with community colleges making up 85% of all postsecondary institutions funded under TAACCCT (Cohen et al., 2017). To receive TAACCCT funding grantees were expected to create career pathways that would "provide workers with the education and skills to succeed in high-wage, high-skill occupations" (USDOL, 2016, p. 3). Drawing on lessons learned in earlier career pathways initiatives, including directly referencing I-BEST and AO, the TAACCCT grant program provided resources on a far greater scale to support community colleges engaged in this work than had ever occurred in the past.

Ultimately, TAACCCT developed or redesigned about 2700 programs that enrolled one-half million students who earned more than 350,000 credentials. Manufacturing and healthcare were the two sectors with the most grants, followed by energy, information technology, transportation and logistics, green technology, and agriculture (USDOL, 2016). Numerous research and evaluation studies showed the grants reached the primary target of adult students, with 31 being the average age of all grant participants (Durham et al., 2017). However, TAACCCT grant participants were not as diverse as the national population of community college students, with a higher proportion of men than women participants (60% compared to 40%, respectively). Neither were as many grant participants identified with racially minoritized groups than community college students generally (49% versus 59%, respectively). Also, the predominant enrollment pattern changed over the course of the grant, with the majority students enrolling full-time during the first two rounds beginning October 1, 2011 and 2012, but shifting to part-time during the next 2 years beginning October 1, 2013, and extending to October 1, 2014. This change shift in enrollment paralleled the nation's improving economy when unemployment rates dropped and community college enrollments began dropping precipitously, a trend that has not changed to the present time.

Required by TAACCCT, 215 third-party evaluations were completed in rounds two through four of the grant program to assess implementation and participant educational and employment outcomes and impacts (Eyster, 2018). Researchers at the Urban Institute and Abt Associates prepared a series of reports from these third-party evaluations and the national evaluations to draw lessons for future initiatives (Eyster et al., 2020; Kuehn and Eyster, 2020; Mikelson et al., 2017). These results revealed promising developments in how community colleges changed career pathways systems and programs to better support adult learners, though capacity challenges born by community colleges that receive modest public funding compared to other higher education institutions (e.g., public and private universities) hampered some of the goals and outcomes grantees hoped to achieve.

A separate meta-analysis of the TAACCCT third-party evaluations was conducted by a team of researchers affiliated with New America and the University of Washington (Blume et al., 2019; Bragg, 2019). This study conducted after the TAACCCT grant ended in 2017 included a systematic review of more than 200 third-party evaluation reports that were funded under the grant. Using a set of criteria to assess the rigor of the research design used in these studies, this meta-analysis focused on 36 quasi-experimental design (QED) evaluations to estimate overall effects sizes for education and employment outcomes. Results revealed a positive effect on both education and employment outcomes for TAACCCT participants, with a greater magnitude of effect on the education outcomes (program completion and credential attainment) than the employment outcomes (post-program employment and pre-to post-program wage change). This analysis found students in TAACCCT-funded programs were nearly twice as likely to complete a program or earn a credential than comparison students, and 27% more likely to have positive labor market outcomes (employment or wage gains) than comparison students.

Complementing the quantitative meta-analysis was a qualitative study designed to understand implementation of key program elements funded by TAACCCT. This analysis confirmed career pathways implemented widely by grantees included stacked and latticed credentials, prior learning assessment, comprehensive student supports, career advising and guidance, and employment supports. Partnerships between community colleges, workforce agencies, and employers were also developed through TAACCCT, and grantees also mentioned the importance of TAACCCT's extensive funding of third-party evaluations as an important way to improve the tracking of participant outcomes.

What works clearinghouse meta-analysis on career pathways

Commissioned by the What Works Clearinghouse (WWC) of the USDoEd, a panel of researchers and practitioners was formed to summarize rigorous studies that met the WWC standards and present results and recommendations to guide future career pathways implementation in the US community college context. An exhaustive review of published and unpublished literature located over 16,000 studies potentially relevant to the project, identifying 122 meeting the strictest eligibility requirements for review. Of these, 22 studies met the WWC standards with or without reservations, and most of these focused on career pathways entry and integrated education and training functions. Nearly all these 22 studies also focused on adult education, workforce training and non-degree postsecondary education, providing further evidence pertaining to how entry and integrated education and training manifest in career pathways. Results of the studies were synthesized around five themes that formed the basis for recommendations that represent the most systematic and exhaustive analyses of career pathway completed to date in the US (Cotner et al., 2021).

Applying the meta-analysis process required by the WWC, nine of the 22 studies showed overall statistically significant favorable results on college credit accumulation, industry-recognized credential attainment, short-term employment, short-term earnings, and non-degree credentials. Only two studies measured college degree attainment, highlighting a void in what is known about how career pathways help to advance participants beyond short- and medium-term education and credentialing. The panel's recommendation to intentionally design and structure career pathways with career progression in mind is intended to enable students to access further education and obtain and advance in employment over the course of their lives. This recommendation also recognized that, whereas all educational institutions enroll students in courses and programs, career pathways should prioritize the student's entire educational experience, from access and entry, to completion and credentialing, and on to employment and career advancement. This purposeful approach to supporting student attainment continues to be theorized to lead to positive student outcomes despite a dearth of longitudinal studies to assess these results.

Studies that met the WWC standards revealed findings on college credit accumulation, industry-recognized credential attainment, and postsecondary degree attainment. Though this group of studies was relatively small, results showed a consistent, positive impact on college credit accumulation and industry-recognized credential attainment. These results showed students' educational outcomes were improved and compelled the panel to recommend delivering contextualized or integrated basic skills instruction to accelerate students' entry into and successful completion of career pathways. Some of the studies also provided descriptive results on program implementation that may be useful to scaling up career pathways in the community college context.

Studies meeting the WWC standards were further scrutinized to understand results pertaining to five education outcomes: industry-recognized credential attainment, academic performance, technical skill proficiency, credit accumulation, and postsecondary degree attainment. As seen in the above mentioned discussion, results on industry-recognized credential attainment were statistically significant and favorable. However, results on academic performance, technical skill proficiency, and credit accumulation were indeterminate, meaning findings could be favorable or unfavorable but were not statistically significant. Moreover, nearly all the studies that met the WWC standards focused on non-degree credentials, providing limited information about results on postsecondary degree attainment. Given available evidence, the panel recommended community colleges should offer flexible

instructional delivery schedules and models to improve credit accumulation and enhance completion of non-degree credentials along career pathways.

The rigorous studies meeting WWC standards and measuring outcomes relative to comprehensive student supports focused on the education outcome domain only. Similar to the previous recommendation on flexible scheduling, findings on industry-recognized credential attainment were statistically significant and favorable. Findings on credit accumulation were also statistically significant and favorable, reinforcing the findings of Blume et al., 2019 suggesting holistic supports are related to favorable student outcomes. Drawing on these findings, the panel recommended that career pathways provide coordinated comprehensive student supports to improve credit accumulation and completion of non-degree credentials along career pathways.

Statistically significant and favorable outcomes were found in the WWC meta-analysis process for short-term employment, short-term earnings, and medium-term earnings. However, for medium-term employment, the meta-analysis results were indeterminate. To clarify, this does not mean employment-focused partnerships do not lead to labor market success; instead it points to a dearth of research that tracks students through training and into employment for long enough to measure long-term outcomes. The panel's recommendation related to partnerships encouraged community colleges to develop and leverage partnerships to prepare students and advance in the labor market. This recommendation specifically emphasizes labor market success, based on studies that examined the following four short- and medium-term labor market outcomes: short-term employment, short-term earnings, medium-term employment, and medium-term earnings.

Research needed on career pathways

Going forward, it is important to continue to evaluate the impact of career pathways on student outcomes using rigorous research designs that generate results for underserved student populations. Knowing that inequality is growing in the US by race, income, social class, age, and other demographic characteristics is critical to understanding how career pathways work in the aggregate, but more importantly how they work for student sub-groups. The vision of career pathways to address structural inequalities inherent in postsecondary education and workforce training programs remains unknown without systematic examination of outcomes by race, income, and other factors known to exacerbate inequality. Implementing and scaling improved career pathways systems and programs requires reaching youths and adults who are most disadvantaged by current dysfunctional policies and practices.

Moreover, additional research is needed on the key career pathways functions of entry, integrated education and training, and career progression. Each of these functions plays a specific role in the overall career pathways framework, and yet many research and evaluation studies fail to distinguish which functions are being employed in the career pathways they are examining and who these functions are intended to serve. With a more nuanced approach to research, it may be possible to more clearly understand how career pathways functions prepare students for employment and career advancement. Again, this research should disaggregate results by race, income, social class, age, and other demographics to reveal how career pathways may be benefiting student sub-groups differentially and inform implementation to avoid so systematic inequities.

Higher education must not only give solid skills for the present and the future world but must also contribute to the education of ethical citizens committed to the construction of peace, the defense of human rights and the values of democracy.

UNESCO (2009, p. 2).

Internal and external pressures are stimulating re-examination of the academy's primary role. Is the core purpose teaching the disciplines, cultivating critical thinking and problem-solving, preparing students for careers, promoting economic development, contributing to local communities, generating knowledge, or cultivating the civic capacities needed for a flourishing democracy? The easy, and not inaccurate, answer is that the mission of higher education encompasses all of these possibilities and others.

Bringle et al. (2014, p. 14).

Service-learning is a type of experiential education and a form of community-campus engagement that offers higher education what may be its best means of fulfilling the complex and vital charges articulated above. It is a key strategy for reclaiming and centering civic purposes—understood as the intertwining of learning, action, and change—for everyone in the academy and for institutions of higher education (Saltmarsh and Zlotkowski, 2011). From its roots in social justice, service-learning has evolved over the past 45+ years to be not only a mechanism for social change and a means of engaging students and instructors with community members and issues but also a pedagogy variously focused on education for democracy, disciplinary and interdisciplinary learning, and career development around the world. It is increasingly used as a strategy for democratic engagement, collective impact, and critical engagement with systems of oppression (Bringle et al., 2014; Clayton and Bandy, 2021; Mitchell, 2008). Service-learning in the southern hemisphere is explicitly oriented toward awareness of and action on issues associated with power, oppression, privilege, and justice—a framing that is often referred to there in terms of solidarity and that is known in the United States as critical service-learning (Mitchell, 2008; Tapia, 2012). It is understood by *Centro Latinoamericano de Aprendizaje y Servicio Solidario* (CLAYSS), for example, as an approach to co-learning from experience in which all participants “together commit themselves in the transformation of reality” (CLAYSS, no date, para 1).

Originating in the United States, service-learning has spread and grown around the world. Such organizations as the International Association for Research on Service-Learning and Community Engagement, the Asia-Pacific Regional Conference on Service-Learning, the Service-Learning Asia Network, the European Observatory of Service-Learning in Europe, the Latin American Center for Solidarity Service-Learning, Engagement Australia, and the South African Higher Education Community Engagement Forum have enabled the worldwide development of both practitioner networks and a growing base of service-learning research, theory, and best practices.

Key to the potential of service-learning is civic action as both a means and a desired outcome of education. Service-learning has the potential to “change everything” (Saltmarsh, 2010, p. 332) about higher education's functions. As a substantive and often counter-normative alternative to hierarchical and technocratic processes, service-learning—when designed to fulfill its democratic, critical, transformative potential—confronts the academy with an array of complexities, challenges, and possibilities. Thus, it can provide a basis for contributing to the development of individuals and institutions in ways called for in the opening quotes.

We examine the meanings, purposes, and roles of service-learning in higher education; empirical support for service-learning's contributions to students' academic learning, civic learning, and personal growth; the nature of the community-campus relationships at the heart of service-learning; institutional support for service-learning; and how that support can be directed toward enhancing community-campus relationships in service-learning and community engagement more generally. Our goal is to advance conversations and deepen practices in the academy and in communities related to the potential of service-learning to enhance learning and action, deepen relationships between individuals and organizations on campuses and in communities, and promote positive change. The stakes are both timely and enduring given the significant and unique contributions higher education can and must make with local to global communities to co-create "a world that is increasingly peaceful, compassionate, just, inclusive, and verdant" (Clayton et al., 2014, p. 6).

Conceptualizing service-learning

Service-learning is one example of processes through which campuses collaborate with broader communities that intertwine learning and change. The broader framework of community-campus engagement provides a basis for understanding service-learning as not only a pedagogy but also a means of developing relationships with community members and organizations in the context of which higher education institutions (re-)organize themselves to co-create change. In this section we locate service-learning within both community engagement and experiential education frameworks and explore key elements of a definition of service-learning in this light.

Service-learning as community-campus engagement

Launched in the United States in 2006 and increasingly of interest in other countries (it was piloted in Ireland; McIlrath et al., 2021), the Carnegie Foundation's Elective Classification for Community Engagement foregrounds service-learning as a central dimension of the engaged campus and defines community-campus engagement as the "partnership (of knowledge and resources) between colleges and universities and the public and private sectors" in order to "enrich scholarship, research, and creative activity; enhance curriculum, teaching and learning; prepare educated, engaged citizens; strengthen democratic values and civic responsibility; address critical societal issues; and contribute to the public good" (Carnegie Foundation for the Advancement of Teaching, 2020). A similar benchmarking tool for community engagement that has been developed in Australia (Garlick and Langworthy, 2008). Farnell and Ilic (2021) developed a Toward a European Framework for Community Engagement in Higher Education Toolkit that was piloted in four universities in four countries that also included community-engaged teaching and service-learning.

Fig. 1 provides a framework for conceptualizing community engagement in terms of faculty teaching, research, and service (Bringle et al., 1999). This framework of faculty work, which is from the United States, deviates somewhat from the European framework of teaching, research, and third mission; readers can adapt this conceptual analysis to their own contexts. The Venn diagram in Fig. 1 indicates that all three types of activities can occur both on campus and in communities. For example, a campus can deliver courses at community sites (included in Europe's third mission but included under teaching in Fig. 1) and online as well as on campus; researchers can collect data in communities as well as in classrooms and laboratories; and instructors and staff can provide professional services in communities as well as to their disciplines, departments, and institutions.

Fig. 1 Community engagement as faculty work in the community. Adapted from Bringle et al. (1999, p. 5).

Community engagement, however, is distinct from teaching, research, and service that take place *in* and *for* communities. Community engagement refers instead to activities undertaken *with* communities—with “students, faculty, and community members functioning as co-educators, co-learners, and co-generators of knowledge” (Jameson et al., 2011, pp. 261–262). Reciprocity encompasses respectful integration of multiple perspectives, epistemologies, and assets and is a defining aspect of community engagement and service-learning. From the perspective of faculty work conveyed in Fig. 1, service-learning as a form of community engagement may be seen as the intersection of service with teaching (and/or with research, although not expressed in this visual) in which faculty co-create community-engaged activities that intertwine learning, action, and change with community members, students, and professional staff to the benefit of learning and to the benefit of communities.

Service-learning as experiential education

Service-learning is also grounded in the pedagogical principles of active and experiential learning articulated by Dewey, Lewin, and Piaget, among others (Kolb, 2015). Bringle and Plater (2017) presented a framework of experiential education, modified slightly, that identified the following five components that are integrated in curricular experiential education:

- (a) learning goals/objectives,
- (b) content/body of thought (related to the learning goals/objectives),
- (c) experience/activity (related to the content and the learning goals/objectives),
- (d) critical reflection (on the experience and the content, oriented toward the learning goals/objectives), and
- (e) assessment and feedback (at least of the learning, including as generated through critical reflection on the experience and content).

This framework guides the intentional design of any form of experiential education, including service-learning, toward academically-grounded, assessable learning outcomes.

Service-learning (as with any form of experiential education), when carefully designed (Hatcher et al., 2017), is well-aligned with the attributes of teaching and learning that produce deeper learning. It also pushes the nature and understanding of teaching and learning further through, for example, demonstrating the powerful processes of co-inquiry and co-learning that include not only instructors and students but also members of broader communities. The science of learning provides information on how learning occurs and guidelines for how it can be improved. For example,

What neuroscience researchers have made clear is that “the one who does the work does the learning” (Doyle, 2008, p. 25). The more ways you engage with something that you are learning—such as listening, talking, reading, writing, reviewing, or thinking about the material or skill—the stronger the connections in your brain become and the more likely the new learning will become a more permanent memory.

Doyle and Zakrajsek (2013, p. 7).

Related to these findings is an extensive body of research in psychology on critical thinking and transfer of learning across settings (Fitch et al., 2013). As Halpern (2014) pointed out, “The whole enterprise of learning how to improve thinking is of little value if these skills are only used in the classroom or only on problems that are very similar to those presented in class” (p. 14). Providing learners with diverse and authentic contexts that include multiple opportunities to practice, obtain feedback on, and improve learning is a powerful approach to generating deeper learning. Furthermore, advances in pedagogy should reflect what research has delineated as instructional components that produce deeper learning: (a) active learning; (b) frequent feedback from others (e.g., instructors, other students, community members); (c) collaboration with others; (d) cognitive apprenticeship (i.e., mentored relationships in which students can discuss and learn generalization of principles, transfer of knowledge between theory and practice, and analysis of perplexing circumstances); and (e) practical applications that involve students in tasks that have consequences with a safety net as a buffer against high-stakes mistakes (Marchese, 1997). Well-designed service-learning reflects all of these attributes.

Defining service-learning

There are many forms of experiential education, some of which take place in communities (e.g., internships, clinical practice, field research, work-integrated experiences). However, most of these do not have all the characteristics that define service-learning. After examining nine definitions, De la Cerda et al. (2009) identified seven common features: “responding to social needs or carrying out an action to benefit the community, learning something, performing a service, having a meaningful experience, performing activities of reflection, collaborating with other social institutions, and contributing to training for citizenship” (Sotelino-Losada et al., 2021, p. 3). US scholars Furco and Norvell (2019) reviewed lists of essential elements of service-learning and found that “there are fundamental definitions, elements, and principles of service-learning that apply no matter what the situation or context;” they also noted, however, that the “cultural fibre of the societies in which service learning is practised will ultimately shape overall character of the service learning experience” (p. 32).

In the European context, service-learning is considered a “mechanism” through which “to achieve the ideals associated with the democratic citizen and the promotion of active citizenship” (McIlrath et al., 2019, p. 2), which have become a focus and priority of

higher education on the continent. Europe Engage, a 3-year project started in 2015 involved 12 European Union higher education institutions and was developed to broaden and deepen service-learning as a pedagogy throughout the region. Europe Engage (no date) identified 14 quality standards for service learning, including “defined goals,” “systematic reflection,” “support and coaching for students,” “evaluation and documentation,” and “sustainability” (Preradovic and Stark, 2019) and defined it as:

An innovative pedagogical approach that integrates meaningful community service or engagement into the curriculum and offers students academic credit for the learning that derives from active engagement within community and work on a real world problem. Reflection and experiential learning strategies underpin the learning process and the service is link [sic] to the academic discipline. Service-learning brings together students, academics and the community whereby all become teaching resources, problem solvers and partners. In addition to enhancing academic and real world learning, the overall purpose of service learning is to instill in students a sense of civic engagement and responsibility and work towards positive social change within society.

Europe Engage (n.d.).

We offer the following US.-based definition of service-learning as an example of one that integrates many of the essential elements and that offers specificity that is useful in course design and associated research:

Service-learning is both course-based, credit bearing pedagogy and change strategy that engages students, community members, and instructors/staff in co-creating relationships that integrate academic material, community-engaged activities, and critical reflection to advance public purposes and to achieve clearly articulated academic learning, civic learning, and personal growth goals.

Adapted from Bringle and Clayton (2012, p. 105).

This definition provides a basis for examining several important attributes of service-learning. First, it identifies service-learning as academic work, in contrast with volunteering and co-curricular civic education programs, although some definitions of service-learning do include co-curricular activities in which service is co-determined with community members, aligned with learning goals, and integrated with reflection.

Second, it insists that service-learning is about change as well as learning. The change aspired to may be on campus and can include developing democratic classrooms; recruiting and retaining diverse students, staff, and faculty; operationalizing initiatives for equity and inclusion; strengthening community-campus partnerships; connecting various parts of campus that interact with broader communities; expanding understandings of teaching and scholarship in promotion, tenure, and advancement policies; connecting the goals and activities of academic and student affairs; deepening public trust and accountability; and achieving re-accreditation, quality assurance, and various forms of recognition. Change aspired to in the community may include improving quality of life, strengthening nonprofit organizations and networks as well as community-campus partnerships, informing government agencies about social issues, disrupting systems that perpetuate injustice, increasing available resources, building evaluation capacities, organizing community residents for advocacy work, developing laws and policies, and contributing to environmental and economic sustainability. *Centro Latinoamericano de Aprendizaje y Servicio Solidario* (CLAYSS), which is based in Argentina and facilitates regional and international service-learning networks, conceptualizes service learning largely in terms of change, defining it as:

A pedagogical connection in which the educator and educated learn together from experience and together commit themselves in the transformation of reality. It implies action and reflection on the practice and establishment of ties that allow to act and to learn reciprocally with and from the community (CLAYSS, no date, para 1).

In an overview of service-learning in Africa, Pachó (2019) noted that the focus is often on “(local) developments for a sustainable economy and social welfare” (p. xiv).

Third, the definition we offer highlights the centrality of partnerships in the design, implementation, and assessment of service-learning courses. In the United States, partnerships in service-learning generally include relationships between and among any of the following constituencies of the SOFAR model: Students, community Organization staff, Faculty, institutional Administrators or professional staff on campus and Residents/clients (Bringle et al., 2009). Community organizations are often but not necessarily non-profits or non-governmental agencies. Governmental and municipal agencies, grassroots movements, neighborhood associations, funding organizations, and other collectives may also function as partners. Saltmarsh et al. (2009) noted and called for a shift from (a) community-campus interactions that incorporate the dominant model of academic-expert-centered, deficit-based, hierarchical relationships on campus and in communities toward (b) partnerships grounded in democratic values and commitments that position everyone involved as co-educators, co-learners, and co-generators of knowledge and practice and that foreground an asset-based orientation in which power and responsibility are shared by all partners. Democratic engagement is characterized by partnerships that transcend exchange-based transactions and aspire to transformational change (e.g., of self, others, community organizations, communities, educational institutions, systems, paradigms). In the same vein, the inclusion of *solidario* (solidarity) in the name of the pedagogy as CLAYSS defines it “underline[s] that we are not referring to a traditional, paternalistic, occasional, or superficial kind of service, but to a more horizontal bond between peoples and communities working together for the common good” (CLAYSS, no date, para 1).

Fourth, this definition indicates that partners undertake one or more community-engaged activities as part of service-learning. In all cases, activities must be designed to attend to the full range of goals collectively identified, including promoting student (and other partners') learning and advancing desired change in the broader community (and on campus) while minimizing unintended costs. Community-engaged activities may include direct service (i.e., supporting one another face-to-face), indirect service (i.e., working behind the scenes at a nonprofit organization to develop processes, resources, and/or materials), research (i.e., gathering, analyzing, sharing information with the community), advocacy and social change (i.e., increasing awareness, policy change), or relationship-building and cultural exchange activities (i.e., spending time getting to know one another as individuals and populations). The United Nations' Sustainable Development Goals (SDGs) provide a structure for organizing and determining important foci for service-learning activities in areas such as responsible production and consumption, education, gender equality, affordable and clean energy, environmental issues, and reduced inequality.

Fifth, critical reflection is highlighted in this definition as the necessary process of making meaning from the milieu of academic material and community-engaged activities. Indeed, it is the component of service-learning (and experiential education generally) that generates, deepens, and documents learning and improves the quality of practice, partnerships, and inquiry (Ash and Clayton, 2009). Reflection is best understood and undertaken as critical reflection—as a process of making meaning that is grounded in critical thinking and in the systems critique of critical theory. Reflection should occur before, during, and after community-engaged activities; can take written, oral, audio-visual, or embodied forms; can be conducted individually, with other students, with community members, or with instructors; and can be done in person or virtually (synchronously and asynchronously). Well-crafted critical reflection prompts guide the learner's attention to the presence (or absence) of aspects of their experiences that are related to learning goals and pushes their thinking beyond initial interpretations. The DEAL model provides a structure to guide the design of critical reflection prompts that are tightly aligned with desired learning objectives (Ash and Clayton, 2009). This customizable, research-grounded model supports learners in describing (D) their experiences, examining (E) their experiences using prompts linked to learning goals, and then articulating (A) learning (L) in a way that leads to enhanced future action and ongoing learning (specifically, in this last step, by answering four questions: What did I learn? How did I learn it? Why does this learning matter? What will I do in light of it?). Tools and rubrics affiliated with the DEAL model use Paul and Elder's (2001) standards of critical thinking (e.g., clarity, depth, breadth, fairness) and Bloom's (1956) Taxonomy—moving reasoning from the lower levels of identification, explanation, and application to the higher levels of analyzing, evaluating, and synthesizing—to structure feedback and to assess direct evidence of quality of learning.

Finally, this definition illustrates that service-learning is typically viewed as contributing to three primary domains of learning objectives: academic learning, personal growth, and civic learning. Sometimes professional development, metacognition, ethical inquiry, intercultural or global learning, and other categories of learning are added or are integrated into these three. Regardless of how these categories are conceptualized, the learning focus of service-learning is not limited to students, which is often the default presumption, but also includes learning by all partners (i.e., instructors, campus staff, community residents, community organization staff).

Emphasis around the world has, however, been on conceptualizing, designing for, and measuring student outcomes in particular for some aspects of all three of the primary categories of learning goals. This has been the case in the United States (e.g., Steinberg et al., 2011; Moely et al., 2002); Singapore (Choo et al., 2019), Hong Kong (Ma et al., 2019; Snell and Lau, 2020); Slovakia, Croatia, and Romania (Ilic et al., 2021), and Spain (Regueiro et al., 2021).

Academic learning objectives are often primary. Jameson et al. (2013) offered a framework for conceptualizing and organizing academic learning into foundational learning, higher-order learning, thinking from disciplinary/interdisciplinary perspectives, and critical thinking. Personal growth learning goals require learners to relate their experiences (e.g., observations, interactions) to their values, assumptions, behavioral tendencies, decision-making, strengths, and lives more generally. Brandenberger (2013) explored sub-categories of personal growth that are widely used in service-learning, including moral development and education, identity development, spirituality, self-efficacy, and self-awareness. Civic learning is a defining domain of learning goals of service-learning (as distinct from most other community-based pedagogies and classroom-based curricula) and is conceptualized in a wide variety of ways around the world, including, for example: social responsibility, knowledge and skills for democracy, values clarification, moral development, public good, citizenship, democratic competences, sense of solidarity, Ubuntu, commitment to and capacities to advance social justice, civic identity, cosmopolitan citizenship, life purpose, and global citizenship. Chapters in *Research on Student Civic Outcomes in Service Learning* (Hatcher et al., 2017) explored different meanings of, measures for, and approaches to cultivating and studying civic learning in the US, including from several disciplinary perspectives. Bringle and Clayton (2020) described approaches to designing service-learning courses to generate civic learning outcomes as conceptualized from a variety of national, regional, and disciplinary perspectives and proposed methods for assessing student achievement of civic learning outcomes.

What constitutes a civic learning goal in one context might be viewed as an academic or personal growth learning goal in another. These primary categories of learning goals in service-learning can also be conceptualized as closely intertwined (Hemer and Reason, 2017). The Council of Europe's (2016) Competences for Democratic Culture, for example, identified several domains that implicate personal growth and civic learning and, depending on the context, may constitute or overlap with academic learning as well: values such as human dignity, cultural diversity, and social justice; attitudes such as openness to cultural otherness, respect, and tolerance of ambiguity; and skills such as listening and observing, empathy, and conflict resolution; and knowledge related to world politics, law, human rights, cultures, religions, and history. Sotelino-Losada et al. (2021) highlight "social commitment that entails the development of awareness ethics" (p. 4)—which speaks to both civic learning and personal growth—as key to

distinguishing service-learning from other approaches to experiential education. The emphasis placed by CLAYSS (no date) on solidarity and action yields a vision of citizenship—with corollary, multi-faceted learning goals that can be conceptualized in terms of any or all of the three categories and their intersections—in terms of “not just the knowledge of norms and values and the diagnosis of political and socioeconomic problems” but also “the elaboration of proposals and ... the active participation [in] initiatives” as well as “taking responsibility and commitment in the construction of overcoming alternatives, and the work in articulation with the authorities and civil society organizations.”

Service-learning’s framework for organizing learning into academic, civic, and personal growth learning categories can be used to focus critical reflection toward sets of desired learning outcomes related to global citizenship, which are relevant in many if not most higher education contexts around the world. The Curriculum Framework (Osman et al., 2017) associated with the United Nations’ Social Development Goals, for example, posits such competencies as being able to imagine a better future, learning to question current belief systems, systemic thinking, learning to work together, empowering oneself and others, resilience, and commitment to justice. As a second example, UNESCO’s Framework for Global Citizenship (2015) includes understanding “connections between global, national, and local systems and processes”; appreciating “difference and multiple identities”; developing skills in “information technology,” “media literacy,” and “peace building”; recognizing the influence of beliefs on decision-making and on “perceptions of social justice”; caring for people and the environment; valuing fairness; and developing skills to “critically analyze inequalities based on gender, socio-economic status, culture, religion, age and other issue” (p. 16).

Empirical support for student learning through service-learning

Empirical findings provide a context for understanding how service-learning can contribute to and enrich learning outcomes in higher education. The vast majority of research on service-learning has focused on student outcomes (Clayton et al., 2013a,b; Hatcher et al., 2017), and we limit this section accordingly. Chapters in Clayton et al. (2013a,b) reviewed research, theory, and assessment strategies for inquiry into relationships, processes, and outcomes associated with service-learning for faculty, institutions, communities, and partnerships as well as for students.

Kuh (2008) identified service-learning as a high-impact practice based on students’ self-reported gains of deep learning, general learning, personal development, and practical competence. He determined that “historically underserved students tend to benefit more” from engaged pedagogies such as service-learning than majority students do, although these practices are “high-impact” for all types of students (Kuh, 2008, p. 17). Finley (2011) found that, relative to other high-impact practices studied, service-learning had “the greatest impact on each of the four outcomes [learning, general education, personal development, practical competence] measured” (p. 2).

Meta-analyses of research have documented the contributions of service-learning to student learning outcomes. Celio et al. (2011) found significant improvements associated with service-learning for attitudes toward self, attitudes toward school and learning, social skills, and academic performance among pre-collegiate and collegiate students. Yorio and Ye (2012) found similar results for understanding of social issues, personal insight, and cognitive development. According to Conway et al. (2009), service-learning was associated with positive outcomes in academic, personal, social, and citizenship domains among pre-collegiate, collegiate, and adult students. Novak et al. (2007) compared courses with and without a service-learning component using a quantitative measure of cognitive learning; the effect size in this meta-analysis that was attributable to service-learning was a 53% improvement in learning. Warren (2012) found a similar effect size with a somewhat different sample of research studies. Summarizing the findings of several major studies comparing students who did and did not participate in service-learning, Eyler (2010) found that service-learning increased political interest and efficacy, connectedness to community, social responsibility, future intent to participate in community life, and life skills.

Fitch et al. (2013) summarized research on cognitive outcomes that have been found to result from participation in service-learning, including critical thinking, intellectual development, problem solving, and transfer of learning. More generally, service-learning is associated with such academic success variables such as motivation to complete college and attitudes toward learning (Lockeman and Pelco, 2013; Reed et al., 2015). Research confirms that service-learning contributes to civic knowledge, civic skills, civic attitudes and values, civic behavior, and civic identity (e.g., Battistoni, 2013; Hatcher et al., 2017; Hemer and Reason, 2017). Related to personal growth, Holsapple (2012) documented outcomes including belief in the value of diversity, and Everhart (2016) documented enhanced empathy.

Longitudinal studies

Using a sample of 3450 students attending 42 institutions in the United States, Astin and Sax (1998) found that service-learning had a strong impact on reported academic learning, life skill development, and civic responsibility upon graduation, after controlling for pre-existing student characteristics. Astin et al. (2006) found that service-learning was associated with post-graduation civic leadership, charitable giving, and political engagement 10 years after entering the university. Kerrigan (2005) reported that students in a service-learning course demonstrated enhanced communication abilities, leadership skills, community involvement, understanding of diversity, and career development 3 years after graduation. In Hong Kong, after graduation, students who had participated in service-learning (compared to those who had not) reported higher civic responsibility (e.g., civic awareness, civic efficacy), greater community involvement, and more hours of service per month (Ma et al., 2016).

Authentic evidence

Although most of the research on student outcomes of service-learning has used self-report measures, a few studies have documented authentic evidence of learning that is independently evaluated. Markus et al. (1993) compared students in service-learning and non-service-learning sections of a large political science course and found that learning and course grades were higher for service-learning students. Eyster and Giles (1999) conducted interviews focused on analyzing social problems, with interview transcripts rated by blind reviewers. Relative to students in non-service-learning courses and poorly implemented service-learning courses, students in well-implemented service-learning courses exhibited improvements in causal complexity, solution complexity, knowledge application, and personal political strategy. Reeb et al. (1999) found that service-learning and non-service-learning students had similar levels of academic performance early in the semester but service-learning students showed increasingly superior performance subsequently. Ash et al. (2005) had raters evaluate written critical reflection products from service-learning courses using two types of rubrics and found improvements across the semester on higher order reasoning abilities and critical thinking within all three categories of academic learning, civic learning, and personal growth. Thus, the results that have been found with self-report measures of student outcomes have been supported for authentic, direct measures of learning.

Course characteristics

Knowing how the design of service-learning components (e.g., learning objectives, discipline, reflection, community-engaged service activities, partnerships) differs across courses can clarify which course characteristics are related to which outcomes. Service-learning is too often treated as a constant, homogeneous intervention in research into student outcomes. However, not all service-learning courses are designed according to principles of good practice, and not all well-designed service-learning courses are implemented according to their design.

One of the most central issues in optimal course design is the quality of reflection. Critical reflection can cultivate students' abilities to evaluate various perspectives and circumstances, which enhances their ability to think critically—about themselves (personal growth); about power dynamics, citizenship, policy-making, and systems change (civic learning); and about the content of their courses and the assumptions, methods, and theories of (inter)disciplines (academic learning) (Ash and Clayton, 2009). Outcomes are enhanced when the content of the reflection activities is aligned with the identified academic learning, civic learning, and personal growth outcomes (Astin et al., 2006; Dahan, 2016; Moely and Ilustre, 2014); and when reflection takes multiple forms (e.g., written, oral, collaborative) (Astin et al., 2006; Dahan, 2016). Hatcher et al. (2004) found that regular reflection, structured reflection, and reflection focused on personal values were independently related to the quality of the learning environment in service-learning courses (e.g., active learning, course satisfaction, peer interaction, personal relevance). Conway et al. (2009) meta-analysis found that structured reflection (compared to unstructured reflection) yielded larger effects on citizenship outcomes, social outcomes, and personal outcomes. Choo et al. (2019) found in a study in Singapore that students' perceived quality of reflection prompts was related to academic connections, career preparation, and changes in civic attitudes.

The selection or development of the community-engaged service activities also needs to be aligned with desired outcomes (e.g., for learning, for community change). Brown et al. (2016) found that direct service that facilitated autonomy-oriented helping (compared to indirect service and dependency-oriented helping) resulted in more positive views of social equality. Miller and Yen (2005) reported higher final exam scores for students involved in direct (compared to indirect) service. In Dahan's (2016) research, reflection, direct service, and service duration (>30 h of service) were related to positive change in civic attitudes. Choo et al. (2019) found that students in Singapore reported greater changes in civic outcomes, greater academic connection, and greater career preparation when they also thought they were well-prepared for and engaged in meaningful service activities.

Community-campus relationships and partnerships

Service-learning and community engagement explicitly place importance on community-campus relationships and partnerships, recognizing that they are at the heart of new paradigms for framing activities in the community (i.e., teaching, research, and service in and with communities) that can be both just and meaningful because they integrate knowledge, resources, experience, and questions from a variety of perspectives. Relationships and partnerships may be local, international, or virtual; and they may be with nonprofits, for-profits, government agencies, or schools (to name only a few possibilities). The differences within and among them implicate a wide variety of opportunities and challenges related to goals, culture, history, personalities, economics, politics, and place. The possibilities for developing, maintaining, deepening, and ending as well as for studying relationships and partnerships are rich and varied. In this section, a few ways to conceptualize partnerships, organize them, and investigate them are summarized, and a later section examines ways institutions can support partnerships.

An early framework conceptualizing the types of relationships and partnerships formed by communities and campuses identified five categories, differentiated by duration and complexity: (a) one-time interactions; (b) short-term placements; (c) ongoing, with mutual dependence; (d) core partnerships, with interdependence; and (e) joint creation, with transformation (Enos and Morton, 2003). Any given relationship may move among these categories over time; and any one campus or any one community organization (or community) may engage in more than one of these types of relationships with more than one community or campus partner, simultaneously and across time. More recently, Janke and Clayton (2015) conceptualized community-campus partnerships

into three types, each of them associated with different levels of institutional support (see more on this below): (a) partnerships grounded in individual agendas and interpersonal relationships; (b) partnerships that take the form of networks or collectives, and (c) multi-faceted, institution-level, inter-organizational partnerships. Regardless of the particular typology, clarity as to the nature of the relationship in question aids in establishing goals, designing activities, inquiring into processes and outcomes, and building appropriate mechanisms for communication and trust.

Bringle et al. (2009) drew a distinction between “relationship” and “partnership,” suggesting that partnerships comprise a subset of relationships based on three attributes: closeness, equity, and integrity. Relationships, some of which are partnerships, can be interpersonal (e.g., Bringle and Clayton, 2013) or interorganizational (Janke, 2013) and can take the form of dyads, triads, networks, or partnership entities (Kniffin et al., 2020). As discussed earlier, the SOFAR model parses “community” into representatives of community Organizations and Residents and “campus” into Students, Faculty, and Administrators or professional staff. Bringle et al. (2009) posited that SOFAR relationships can be characterized on an “E-T-T” continuum that ranges from Exploitative (in which someone is taken advantage of or harmed), through Transactional (in which value is exchanged) to Transformational (in which new value is generated and individuals, organizations, partnerships, and/or systems change). Relationships may exhibit characteristics associated with multiple points along the E-T-T continuum (e.g., they may be transactional in some aspects and transformational in others), and they may shift in either direction on the continuum across time and across contexts (Clayton et al., 2010).

The Transformational Relationship Evaluation Scale (TRES) was developed to operationalize the E-T-T continuum. TRES I focuses on the interpersonal relationships in dyadic SOFAR relationships (Bringle et al., 2009). TRES II explicitly broadens the focus of inquiry to include not only interpersonal relationships but also networks (e.g., multi-partner, inter-organizational) and partnership entities (Kniffin et al., 2020). Both TRES I and TRES II invite perceptions of the current and the desired status on each of several relationship characteristics (e.g., goals, decision-making, power, resources). These tools have proven useful in many contexts for studying relationships, structuring reflection on relationships, assessing some of the attributes of particular relationships, conducting research, and guiding practice (Kniffin et al., 2020).

Inter-organizational relationships and partnerships have the potential for enhanced durability (i.e., they are structured to persist despite changes in individual participants), reliability (i.e., they operate in consistent ways), and accountability (i.e., they have standards and guidelines) (Janke, 2013). Interorganizational partnerships in service-learning can evolve into entities with their own partnership identity, in which members are invested in the entity itself, not only in the organizations they represent. Janke’s research into partnership entities focused on “the extent to which and conditions under which partners developed a collective and coherent sense of who they were as a partnership distinct from their employing organizations” (2013, p. 585) and determined that “partnerships that develop an identity may be likely to last beyond the present project; endure changes in persons and resources; and transform how partners view each other, the partnership, and even their employing institutions” (p. 586).

Inquiry into interorganizational relationships and partnership entities is complicated because they involve interpersonal relationships as well, similar to the ways in which inquiry into interpersonal relationships and partnerships must take into account the influences of a variety of organizational, institutional, and other contexts. In addition, whether at the interpersonal or interorganizational level, relationships and partnerships are dynamic, changing as participants and external conditions change. In both practice and inquiry, it is essential to ask who is and is not “at the table” and what dynamics of power and privilege shape their influence on the relationships and partnerships at the heart of service-learning. Bandy et al. (2018) provided a framework and questions to critically evaluate the extent to which inquiry into partnerships aligns with the commitments to democratic engagement (e.g., full participation, co-creation). It includes an extensive critique of the work on TRES through this lens, which has informed both the ongoing refinement of those tools and approaches to assessing the qualities of relationships and partnerships more generally (Kniffin et al., 2020).

Institutional organization to support service-learning

Whereas some examples of service-learning result from the initiative of individual instructors, staff, and/or students, institutional support begins with institutional planning, decision-making, and investment. The impetus for those decisions might begin with senior administration, student leadership, faculty governance, faculty or staff champions, strategic planning, mission-driven changes, institutional and national policies, and accreditation/quality assurance processes. Early on, much effort was devoted to making service-learning a normative part of the work of higher education (i.e., to institutionalize it) by establishing its academic legitimacy. Thus, the types of institutional support included the commitment of permanent funds for centralized offices (preferably located in academic affairs) and the investment of resources (e.g., release time, conference travel, grants) for faculty development. Centralized units can hire and house professional staff (e.g., community-engagement professionals, service-learning specialists, community-campus liaisons, assessment specialists, communications professionals, development professionals), allocate resources to stimulate and sustain service-learning courses, determine and promote best practices in service-learning, assess and report on outcomes, receive inquiries from community organizations and students, and facilitate appropriate linkages of campus and community resources. Examining infrastructure for service-learning in Hong Kong, Ma and Mun (2019) concluded that there was “evidence... that faculty members found support from the OSL [Office of Service-Learning] to be essential and vital to their successful adoption of SL in their teaching” (p. 48). Ti et al. (2021) reached a similar

conclusion based on their evidence of rapid growth of service-learning when it was introduced as their Singaporean institution's signature pedagogy. From the European perspective, a centralized unit has also been endorsed as important to the growth of service-learning (Europe Engage, 2017).

One level of intervention is focused on helping instructors develop service-learning courses. Many departments, programs, and campuses use workshops to introduce instructors to service-learning (Welch and Plaxton-Moore, 2017). Bringle and Hatcher (1995) presented a curriculum for faculty workshops that includes partnerships as one topic. These workshops can be facilitated by professional staff, experienced service-learning instructors, disciplinary specialists, community partners, and students. Less frequently used (Welch and Plaxton-Moore, 2017), faculty learning communities or communities of practice engage a small cohort of instructors in a series of scaffolded workshops over a period of time (e.g., one semester, an academic year) during which they read, discuss, share ideas, and develop plans for implementing service-learning (e.g., Bringle et al., 2000; Jameson et al., 2012; Rice and Stacey, 1997). Mini-grants to instructors to develop service-learning courses have also been used to motivate faculty (Bringle et al., 2000; Bringle and Hatcher, 1995; Rice and Stacey, 1997). Embedded in all of these support programs can be the attributes that transformational and democratic partnerships aspire to. As just one example, professional development for faculty can be held at community sites and co-designed and co-facilitated by community partners (e.g., Studer et al., 2017).

Typically, service-learning occurs at the course level when an instructor collaborates with partners (e.g., students, community members, campus staff) to integrate community-engaged service activities and critical reflection activities into a course. It can also occur at the curricular level when designed to connect course clusters (e.g., themed learning communities), to deepen categories of courses (e.g., 1st year seminars), or to build developmentally across course sequences (e.g., minors, capstones, certificates). Service-learning thus can be—and needs to be—institutionally supported at multiple levels (e.g., individuals, courses, departments, schools, degree programs, campus as a whole). Therefore, strategies that develop leadership, advocacy, and support among multiple constituencies (e.g., executives, deans, chairs, faculty, students, community partners) are important.

Several frameworks and tools have been created over the past several decades to support campuses in such strategic advancement of institutionalization. Bringle and Hatcher's (1996, 2000) Comprehensive Action Plan for Service Learning (CAPSL) is a framework for developing centralized institutional support for service-learning and partnerships. CAPSL delineates four constituencies: institution, faculty, students, and communities and identifies for each the following steps toward institutionalizing service-learning: planning, increasing awareness, identifying prototypes, acquiring resources, initiating activities that result in expansion, providing recognition, monitoring courses, conducting evaluation, conducting research, institutionalization. Other approaches to advancing institutionalization of service-learning and community engagement involve the use of rubrics that describe levels of institutionalization for each of several domains (e.g., Furco, 2002; Holland, 2001).

However, institution type (e.g., 2-, vs. 3-, vs. 4-year vs. graduate; religious; private; public comprehensive; research intensive; metropolitan) and climate (Janke, 2013) as well as specifics of community, economic, political, historic, regional, and national contexts significantly influence the nature of potential institutional support and the processes for cultivating, maintaining, and extending it. Zlotkowski (1998) gathered case studies of approaches taken by different types of institutions in the US. Tijsma et al. (2021) studied institutionalization at a research university, a university of applied science, and a vocational education institute. They reported that the institutional priorities and conflicting structures were different at each institution and, therefore, steps taken to institutionalize service learning need to be tailored to each institution.

The Global University Network for Innovation (2014) overviewed work related to knowledge production, community engagement, and service-learning in Africa, Arab States, Asia and the Pacific, Europe, Canada and North America, and Latin America and the Caribbean. Institutions of higher education around the world are developing their own models of engagement that reflect unique mission statements, institutional traditions and structures, historical and cultural contexts, and community assets. These include examples in Europe (e.g., Aramburuzabala et al., 2019), China (Ma et al., 2018), Ireland (McIlrath et al., 2012), Eastern Europe (Regina and Ferrara, 2017), Singapore (Ti et al., 2021), Asia (Xing and Ma, 2010), Australia (Patrick et al., 2019; Sachs and Clark, 2017), South Africa (Stanton and Erasmus, 2013), and Hong Kong (Ma, 2018). Cross-national comparative studies have emphasized that although there are similarities in the goals to enhance student learning and develop the public purposes of higher education, differences in norms and traditions associated with civic involvement, economic differences, political context, and institutional environments all shape the implementation of service-learning (Bernardo et al., 2012; Hatcher and Erasmus, 2008; Stanton and Erasmus, 2013; Thomson et al., 2011).

Throughout more than four decades of development of service-learning in the United States, and during a shorter time around the world, practitioners have realized that further expansion and improvement of service-learning, and more broadly community engagement, can be facilitated by strategic institutional support (Bringle and Hatcher, 2000; Furco, 2002; Welch and Saltmarsh, 2013; Young et al., 2007). The type of support an institution provides for service-learning, however, depends in part on the goals. One key distinction is whether the intent is to "institutionalize" service-learning—embed it into existing structures—or to leverage service-learning to transform the institution to be more democratic in all aspects of its work. Much of the history of service-learning has embodied the tension between these two understandings of the relationship between service-learning and institutions, with the current conversation arguably evolving in the direction of institutional transformation and perhaps beyond. Zlotkowski's (1995) answer to the question of whether service-learning had a future was that "nothing less than a transformation of contemporary academic culture" would be required (p. 130). Several years ago, once again considering the meaning and role of institutional transformation, he acknowledged that while institutionalization had occurred in many ways, institutional transformation had not. He called attention beyond that distinction, noting that "Recent developments in the world beyond the academy compel us to ask: When does the need to act more forcefully in the greater community overshadow—not eliminate—other needs such as institutional

transformation?" (2015, p. 84). Thinking strategically about institutional support for service-learning highlights the importance of considering the mix of ultimate—perhaps intertwined, perhaps at odds—purposes: institutionalization, institutional transformation, or societal transformation.

With this historical perspective and the distinction between institutionalization and institutional transformation in mind, Saltmarsh et al. (2015) proposed a framework for the latter they called "DPI," standing for Deep, Pervasive, and Integrated. In order for service-learning and community engagement to transform a campus, they posited, they must embody second order change (i.e., fundamental culture change on campus). According to Eckel et al. (1998), on whose work they drew, deep change "profoundly ... affects behavior or alters structures ..., imply[ing] a shift in values and assumptions that underlie the usual way of doing business" (p. 4); and pervasive change "is far-reaching within the institution ... cross[ing] unit boundaries and touch[ing] different parts of the institution" (p. 4). However, even deep and pervasive change can be compartmentalized. Integrative change related to service-learning "foregrounds the synergies that can result from holistic and interdependent approaches to institutional priorities, highlighting the importance of aligning and intertwining [service-learning/community engagement] with ... campus initiatives such as access and inclusion, citizenship and leadership development, internationalization, and assessment" (Saltmarsh, Janke, and Clayton, pp. 124–125). The implications of institutional support for service-learning with institutional transformation as the goal are thus many. Saltmarsh, Janke, and Clayton explored questions of service-learning infrastructure through the lens of DPI:

Given that we seek deep or high quality (asset-based, reciprocal, critically reflective, impactful, continuously improving), pervasive (spread into all corners and dimensions of the life of the campus), and integrated (aligned and intertwined with the full range of campus priorities) SLCE [service-learning, community engagement], what questions do we need to ask in determining whether and how to create institution-wide centers or offices? ... How do we operationalize the interconnections between diversity and community engagement as we think about infrastructure? Do we continue to have offices with staff responsible for these various initiatives working in different parts of campus but in a more intentionally collaborative fashion? Or do we need to embed SLCE within these other offices and integrate SLCE principles and practices within existing structures? (p. 125).

Additional questions about infrastructure that are increasingly being posed at the intersection of institutionalization, institutional transformation, and societal transformation priorities include, for example: (a) whether physical space that houses service-learning and community engagement staff and resources ought to be located off-campus, amid partnering organizations; (b) whether community partners should be financially compensated for participating in professional development, mentoring students, and co-designing or co-facilitating courses; (c) whether to invest limited financial and time resources into faculty conference travel or international travel opportunities for students or directly into social justice initiatives; and (d) whether professional staff can appropriately dedicate work hours to engagement with community partner organizations. Thus, institutional support specifically in the context of service-learning relationships and partnerships, to which we now turn, may generate challenging questions about where it is most important and most urgent to focus institutional support given the ultimate purposes posited for higher education—purposes at the interface of learning, civic action, and change.

Institutional organization to support the development of relationships and partnerships

Institutional support consists of intentional and deliberate steps to provide some form of infrastructure, funding commitments, professional assistance, and policies to establish, support, and improve relationships and partnerships across all engagement activities, including service-learning. In all cases, promoting community-campus relationships that aspire to being transformational and democratic partnerships should focus on all constituencies in SOFAR (i.e., students, community organization staff, faculty, administrators/staff on campus, and community residents). Each of these can be in a position to advocate for and help develop democratic, transformative partnerships. This section shares examples related to community partners and faculty; other sources contain information for those interested in work related to community engagement professionals (e.g., Dostilio, 2017; Dostilio and Welch, 2019) and students (e.g., Zlotkowski et al., 2006) as supporters of all aspects of service-learning, including partnerships.

Engaging with community members to determine overall goals for service-learning and community engagement and associated infrastructure, funding, professional assistance, and policies to support relationships and partnerships is key and, in some quarters, increasing. Sandy and Holland (2006) asked community partners about their perspectives on service-learning partnerships and documented particular interest in:

how to engage more deeply with faculty; recognizing partners as co-educators of students, with all the planning and preparation that entails; committing the academic institution to ongoing action as an institutional citizen in larger-scale community development projects; and finding ways to develop appropriate institutional infrastructure that supports and facilitates these shifts in emphasis and practice (p. 40).

Similarly, and more recently, interviews with community partners related to their perceptions of the processes and outcomes of their partnerships with higher education institutions (Muse, 2018) revealed their conviction that democratic partnerships are desired outcomes in themselves and that they require foregrounding relationship quality. The community partners in the

Sandy and Holland (2006) study identified working effectively with faculty as the central challenge they face and expressed a desire for more direct and longer-term interaction, a more collaborative approach to course design, and deeper engagement of faculty in their organizations' work. They also indicated that they most valued opportunities to be co-educators of students. Writing about the value they placed on institutional policies and practices that support faculty in the work of democratic partnerships, community partners stated:

We were able to level the playing field to a great degree because of the ... faculty members' great commitment to learning to work in a more participatory process such as being trained in consensus decision-making.

Freeman et al. (2009, pp. 93–94).

Thus, designing institutional support for service-learning and community engagement should be deeply informed by—if not also undertaken collaboratively with—community partners.

As institutional support is initiated, developed, and strengthened, faculty are central to the development of relationships and partnerships in service-learning and community engagement.

Faculty development plays a key role (e.g., Bringle and Hatcher, 2000; Furco, 2002; Holland, 2001) and can be accomplished through such mechanisms as faculty/staff learning communities, workshops, presentations, discipline specific consultants, and informal one-on-one consultation with professional staff. Levkoe and Stack-Cutler (2018) provided an analysis of relationship brokers in Australia and the United Kingdom.

Another level of focus in institutional support for activities that include SOFAR relationships occurs at the meta-course level. Institutions can devote activities and resources to having departments and schools review their entire curriculum, consider where service-learning fits within it, and plan what steps might be taken to enhance its role across the curriculum (Kecskes, 2013). Such an approach encourages re-examination of unit-wide learning outcomes, including civic learning, and explicit mapping of courses and pedagogical approaches to those outcomes. In addition, it provides opportunities for members of an academic unit to consider how and with whom they are partnering in communities and how they can strategically improve SOFAR relationships in ways that are consistent with transformational and democratic partnerships (Messer and Kecskes, 2008). Service-learning courses and other community engagement activities can be part of interdisciplinary coalitions that are organized around a common theme (e.g., health, environment, food, poverty) or geographic area (Tijmsa et al., 2021). Campuses can then coordinate and support multiple courses with one or more community organizations.

Both for individual instructors and courses and for programs operating across multiple service-learning courses and community engagement activities, there are opportunities for professional staff in centers to support the development of democratic relationships, reciprocal relationships, and transformational partnerships. Bringle et al. (2009) suggested using TRES to deliberately make visible the perspective of each individual in the SOFAR model concerning a relationship's position on the E-T-T continuum, and professional staff can facilitate such examination. One strategy is to have each individual in a relationship complete TRES, indicating their perceptions of the current and desired status of each item, and then bring them together to compare and contrast their responses and envision the future of the relationship accordingly (Bringle et al., 2009; Bringle and Clayton, 2013). Such a process can result in determination of appropriate changes and investment in the capacity building needed to take concrete steps to move forward together.

Davis et al. (2017) described another approach to facilitating learning and change associated with service-learning relationships. Their approach has participants from both campus and community organizations map power and reciprocity followed by dialog on civic engagement and transformative learning. The presumption is that this process generates creative tensions among participants that allow them to “uncover premature consensus and insincere tolerance” (p. 46). Participants can then identify mutually agreed upon goals, make changes in goals and processes, and learn from each other about how the relationship should proceed.

A partnership between Museum Studies faculty and the staff of several local museums in Indianapolis was similarly supported by a service-learning specialist in using the visual reflection method of Collaborative Relationship Mapping (Price, 2016) to examine the ways the nature of their relationships—particularly in terms of closeness and integrity—influenced programmatic and organizational outcomes. Among the transformational results of this activity, the partners created new processes to educate employees and faculty about the history of the partnership and initiated longer-term joint planning cycles to enable deeper connections (Bandy et al., 2018).

As another example of institutional support for faculty development focused on enhancing relationships and partnerships, external consultants can be engaged to facilitate self-study. Miller-Young et al. (2015) reported on such a process, in which a group of faculty and staff examined a key tenet of SOFAR relationships, reciprocity, using a method from Decoding the Disciplines (Pace and Middendorf, 2004). Consisting of reflecting individually, interviewing one another, and discussing experiences and readings, the process provided a space in which participants deepened their understanding of reciprocity and identified associated actions to improve their practice. Both the participants in and the facilitators of the project experienced transformative learning about the nature of reciprocity. Anderson (2017) and Lloyd et al. (2017) also provided examples of centralized initiatives that operate across a campus and promote quality relationships across community-campus projects.

Conclusion

Service-learning is an evolving field. Some of the recent trends that are shaping the future include credentialing service-learning and civic engagement professionals (Dostilio, 2017; Dostilio and Welch, 2019); scaffolding service-learning across sequences of courses and across disciplines (Jameson et al., 2008; Ti et al., 2021); assessing the quality of components of service-learning courses and mapping components to outcomes (Bringle et al., 2017; Furco and Matthews, 2018); developing global service-learning with and without international travel and attending to implicated ethical issues (Green and Johnson, 2014; Hartman et al., 2018); integrating service-learning with other pedagogies, including internships and research (Bringle, 2017) and into course clusters (MacGregor, 2003); enhancing the democratic aspects of relationships, processes, and outcomes of service-learning and community-campus engagement (Bandy et al., 2018; Saltmarsh et al., 2009); integrating service-learning with distance education and technology (Bringle and Clayton, 2020; Waldner et al., 2012); integrating initiatives focused on diversity, equity, and inclusion with service-learning and community engagement (Sturm et al., 2011); and using the United Nations' Sustainable Development Goals as a basis for organizing and coordinating activities across service-learning and community engagement (e.g., Gonzalez Rabanal, 2021). With all of these recent and emerging developments and in light of its intertwining of learning, civic action, and change, service-learning is clearly at the forefront of the academy's revisioning around its public purposes and more authentic relationships with community constituencies.

Introduction

In this chapter, 30 years of competency-based training in Australia are recorded and analyzed. The paper updates two previous accounts by the author, of 10 and 20 years of competency-based training (CBT) by presenting a new analysis of the third decade of CBT. The paper analyses the major curriculum flaws in the system, and suggests modest improvements.

The chapter takes a specific and narrow approach to the meaning of the term CBT. It refers to the Australian/British meaning of the term (Smith, 2010) where VET systems are primarily based on industry derived national competency standards which apply nationally. In Australia these standards are contained within artifacts known as Training Packages. Australia is perhaps the most extreme exponent of this system, as in the UK system, other curriculum alternatives are available besides what are known there as National Vocational Qualifications. The Australian VET system has been competency-based since the mid-1980s, and as in many countries, competency-based training as a concept has been heavily critiqued on a number of fronts; Smith (2010) describes them as "philosophical," educational and practical arguments.

As was noted in Smith (2010) there are other understandings of the actual term "competence," which are generally broader, both in national systems and in academic debates. Even in Australia, early debates around competency-based training included discussions of more general competencies and extended beyond VET (e.g. Gonczi, 1994). These discussions no longer occur, and hence when CBT is discussed in Australia, it means the system as it currently stands.

One reason why Australia might be of particular interest internationally, apart from being an extreme example of a particular type of CBT, is that its elements of its system have been "exported" to other countries, especially in Asia (e.g. Sung, 2011, discussing Singapore). In these exports, CBT often contributes to formal national qualification structures, as in, for example, India's National Skills Qualification Framework (<https://nsda.gov.in/>). More broadly, occupational standards linked to national VET qualifications frameworks are common to several developed countries (Allais et al., 2014).

Background on the Australian vocational education and training system

Australia has a well-developed VET system. It is overseen by the national ("Commonwealth") government but the lower tier of government—eight States and two Territories—provide funding for VET courses, and employ VET teachers in the public system, TAFE (Technical and Further Education). In Australia, VET is usually understood to have two main purposes. One is to improve people's skills by training them before they enter the workforce, or by upskilling them after they enter the workforce, thus lifting productivity, reducing accidents, and making movement of workers among industries and occupations easier. The other purpose is to provide social benefit, improving individual people's life chances, confidence, and employment prospects. Currently, the benefits of VET in Australia tend to be expressed in economic rather than social terms; hence industry and employers feel they have ownership of VET. This is an important contributor to the nature of CBT in Australia.

VET has qualifications covering most industry areas, for occupations that are not regarded as needing university preparation. The Australian Qualifications Framework (www.aqf.edu.au) ranges from AQF 1 (pre-employment courses) to AQF 10 (university

doctorates). With some minor exceptions, VET covers AQF levels 1 to 6. The first four levels are Certificate I to Certificate IV, Level 5 is Diploma and Level 6 is Advanced Diploma. Most VET students are in Certificate II to Certificate IV qualifications; in 2019, almost half (47.2%) of students were in Certificate III programs (National Centre for Vocational Education Research [NCVER], 2020). Certificate III is the level of most apprenticeship programs and is regarded as the qualification for “skilled” non-supervisory work.

Most qualifications are contained in “Training Packages,” based around industry and/or occupational areas, all of which have large numbers of units of competency gathered into multiple qualifications. There are also a small number of other “accredited courses,” usually accredited by individual States. Training Packages were introduced initially in 1997 and are explained in more detail throughout this chapter. Many occupations did not have formal VET qualifications until the advent of Training Packages (Smith and Keating, 2003). The six Training Packages with the most government-funded enrollments pre-COVID were Community Services (which includes child-care training); Construction; Business; Tourism and Hospitality; Electrotechnology; and Health (NCVER, 2019, reporting 2018 Figures¹).

Training providers are known as “Registered Training Organizations” (RTOs). There is a public provider, TAFE (Technical and Further Education), and around 5000 other training providers, many of which are small and in niche areas, and most of which are private and for-profit. Often the term “RTO” is used to refer only to non-TAFE training providers. Marketization of the VET system (i.e. access by private providers to government funding for their students) has proceeded steadily during the past 30 years. This process has been assisted by competency-based training, as national competency standards have removed the necessity for providers to develop their own curriculum from first principles.

In 2019, there were just over one million students—1,011,000—enrolled in government-funded VET (NCVER, 2020), just over half in TAFE, from an Australian population of just over 25 million. In addition, some VET is delivered on an entirely fee-paying basis, including to overseas students in Australia, and, to a lesser extent, in other countries. Students were evenly distributed across age ranges, with the largest concentration in the group 25–44 years (NCVER, 2020). The number of government-funded students in VET has declined over the past 8 years, from a high of 1.54 million in 2012 (NCVER, 2019), so that there are now fewer government-funded VET students than higher education students in Australia. The decline has been partly due to a number of financial scandals, mainly involving misuse of government funding by private RTOs (Smith, 2019), but also due to withdrawal or reduction of funding for training for many occupations.

The financial scandals have led to a heavy focus on regulatory compliance, with strict rules put in place to try to prevent further problems. Regulation of the system has been carried out since 2011 by a national regulatory body for the VET sector, known as the Australian Skills Quality Authority (ASQA) (www.asqa.gov.au). This body registers and re-accredits RTOs, as well as carrying out special audits in qualifications known to be “at risk.” Prior to 2011, regulation was carried out by the State and Territory governments.

The web site www.training.gov.au enables all curriculum elements of the national competency-based system to be viewed by anybody. Later in this chapter, the section “the current nature of CBT curriculum” provides more details and refers the reader to **Appendix 1** which contains some examples.

Method and evidence base for this chapter

The chapter seeks to answer three research questions.

1. How has the Australian system of CBT evolved over the past 30 years?
2. In what ways has it painted itself into a corner?
3. How can this situation be improved?

As explained in Smith (1999), competency-based training as a curriculum approach was not unknown in Australia prior to the end of the 1980s in some industry areas and some training providers, but its national hegemony dates from the end of that decade. Hence the paper takes 1990 as the beginning of CBT as it exists today.

The chapter builds upon the two accounts (Smith, 1999, 2010) which reported and analyzed developments in the first ten and then the first 20 years of CBT as we currently know it, augmented by an analysis of developments since 2010. The earlier accounts and the current third decade update, as well as referring to the scholarly literature, are based on a number of sources. They draw on publicly available documents, including government announcements and consultation papers, about changes in the system. They also draw on the author’s understandings from leading several major research projects specifically on CBT, and on industry training and Vocational Education and Training (VET) more generally. Perhaps most importantly, the accounts are strengthened by the author’s engagement in and with the VET system as follows:

- Working in the development and review of Training Packages, in different capacities over a 20 year period:
- For 2 years as a manager of a State-based Industry Training Advisory Board, managing the development and maintenance of seven Training Packages in the retail and personal services area, and
- For substantial periods of time, as a member of relevant national committees overseeing the development, review and maintenance of the qualification for VET teachers and trainers.

¹These 2018 data are the latest figures which are readily available in the public domain. NCVER no longer publishes analyses of the data by Training Package.

- Constant dialog, as a policy-engaged researcher, with VET government officials, industry and stakeholder groups, in Australia and also in Europe and Asia;
- Teaching hundreds of practicing VET teachers over most of the period 1993–2020 in VET teacher-education programs, at three universities;
- Experience of embedding CBT qualifications within those VET teacher-education programs for many years, and thus constructing curriculum and assessment tasks according to, and compliant with, required Training Package “rules.”

Accounts of relevant developments in each of the three decades of CBT are now provided, each section beginning with an overview followed by more detail on major events and developments. The current system is then explained in more detail with specific reference to national “curriculum” documentation, i.e. Training Package components. An analysis follows of the ways in which the developments described, and the current system, have forced Australian VET into a “curriculum corner,” and how it could begin to emerge.

The phrase “painting oneself into a corner” means to create a situation from which extrication is very difficult. It implies a progressive “boxing in,” and also implies that the situation is one which a person or people had created for themselves. While phrases may differ from country to country, the concept is universal. An equivalent phrase in Spanish, for example is “Cuando uno se mete en un callejón sin salida”—turning into an alley from which there is no exit. Other English phrases are similar to “painting oneself into a corner,” such as “digging oneself into a hole” but the latter implies more finality; “painting oneself into a corner” offers a greater possibility of extrication, albeit messy.

The first decade of CBT

Overview: The “10-year” account (Smith, 1999) showed that the main features of the first decade of CBT—the 1990s—were the establishment of a national system, the penetration of CBT into all parts of formal VET, and, toward the end of the decade, the initial introduction of Training Packages designed to create broader coverage of the system and to remove accreditation of curriculum. From 1992 the system was overseen by the Australian National Training Authority, a statutory body set up to implement what was known as the Training Reform Agenda (Smith and Keating, 2003) which included aspects other than curriculum, including marketization of VET.

The current system has its basis in an agreement in the late 1980s between the Commonwealth (national) government and the trade union movement that the VET system needed to be reformed. The government wanted to upskill the workforce to meet perceived international economic competition, and to improved labor market outcomes for young people; and the trade unions were interested in skill-related career paths for workers (Phillimore, 1997). A meeting of Commonwealth (national) and State Ministers in 1989 decided to introduce a competency-based system, establishing a National Training Board to develop industry competency standards. In 1990, a “strategic framework” for CBT implementation was agreed, and a target was set for “substantial implementation” by the end of 1993.

While employers were not pivotal in the establishment of the system, by the early 1990s one of the three main peak employer bodies, the Australian Chamber of Commerce and Industry, was fully on side, thus cementing the “tripartite” (government, labor and industry) nature of the system. ACCI developed a definition of CBT as follows:

A way of approaching (vocational) training that places primary emphasis on what a person can do as a result of training (the outcome), and as such represents a shift away from an emphasis on the process involved in training (the inputs). It is concerned with training to industry specific standards rather than an individual’s achievement relative to others in the group.

Australian Chamber of Commerce and Industry, 1992; in Smith and Keating (2003: 102).

ACCI is now one of the major proponents of the system, along with the manufacturing and metal workers’ union, which was a major driver of competency-based training in the late 1980.

An early government-commissioned evaluation in 1990 (Thomson et al., 1990) found that only about 13% of courses in TAFE were competency-based. A further government-commissioned evaluation, which was led by the author (Smith et al., 1996) was undertaken in 1994, covering non-TAFE training providers as well. By this time implementation had spread, but still only 29% of TAFE courses and 39% of non-TAFE courses were found to have CBT features. One common discovery in both evaluation projects was an inability of stakeholders to agree on what CBT actually meant. In the Thomson et al. project a course was classified as CBT if it had any three of seven competency-based attributes; in the Smith et al. project, a categorization of “CBT-ness” was developed, with courses allocated to one of four bands: non-CBT, SC, SCIR and SCIRA. The bands were defined as follows (Smith et al., 1996: 64).

- **Band SC**—courses which were based on competency standards (S) or with formal industry consultation where there are no standards and where the course is written in CBT format (C). This band was taken as the “minimum” definition of CBT.
- **Band SCIR**—courses which were defined as meeting the minimum definition of CBT, and also involved industry in course monitoring (I) and operate recognition of prior learning (RPL) procedures (R).

- *Band SCIRA*—courses which, in addition to Band SCIR characteristics, had assessment available on demand and at least partly in the workplace (A). These were considered at that time to be the main attributes of competency-based assessment

Only 2% of TAFE courses and 11% of non-TAFE courses were in the SCIRA band. Adoption of the assessment features, which were not at that time part of government policy, were posited by the authors (Smith et al., 1996) to depend on a number of factors: institutional, industry area, the nature of the students, and the nature of the course. These decisions might, and could, be made at the point of writing of the curriculum document, the State level, the individual training provider, or by the teacher, and decisions could be conscious or could occur by default. The study concluded that some features would never be universally appropriate; for example, some students might not have access to a workplace and therefore assessment could not occur in the workplace.

The National Framework for the Recognition of Training (NFROT) was introduced in 1992 to be used by State accreditation bodies. Courses accredited under NFROT could then be nationally recognized. The courses were required, for accreditation, to present curriculum, including “learning outcomes” derived from the National Training Board competency standards; the “learning outcomes” guided assessment. Smith et al. (1996) found that courses that had been through the NFROT process were more likely to have more features of CBT.

A major government-commissioned review of the system (Allen Consulting, 1994) led to a restructuring of the CBT system and its associated structures. In 1997, NFROT was abolished and there was no longer any scrutiny of curriculum. Instead, training providers—now to be known as “Registered Training Organizations”—would be accredited to deliver “Training Packages.” Training Packages were to contain only competency standards, packaged into qualifications, together with assessment guidelines. The Training Package system began with the establishment of industry competency standards bodies (known as Industry Training Advisory Bodies), with government funding. Initially they were still assisted by the National Training Board.

CBT was contested from the beginning. As noted earlier, Australian arguments could be grouped into “philosophical,” educational and practical (Smith and Keating, 2003). West (2004), writing about the UK described similar groups of early arguments as “technical and moral.” In Australia, as in UK also (Burke, 1989) arguments were mounted around teacher capability and/or engagement. Teachers tended to be suspicious of CBT and unsure how to implement it (Robinson, 1993; Cornford, 1996), and little staff development was received by teachers.

The second decade of CBT

Overview: In this second decade, the 2000s, Smith (2010) shows that the Training Package system in Australia, which has been described as “second generation CBT” (Barratt-Pugh and Souter, 2002), became firmly established. The term “nationally-recognized training” came into common use, referring to qualification-based training based on Training Packages. The industry competency standards development bodies were replaced by Industry Skills Councils (Australian National Training Authority, 2004), but the system of Training Package development remained similar. At the time of the 20-year review by Smith (2010) there were 80 Training Packages, some of which were company-specific.

There were several key events during this decade. A major review of Training Packages was commissioned by ANTA, in 2003 (Schofield and McDonald, 2004). The review made some design recommendations and also advocated for better staff development for teachers so that they could deliver Training Packages more confidently. However, ANTA was disestablished in 2005, with some, but not all, of its functions moved to the relevant department in the national government, and the recommendations withered without a clear driver. There was a subsequent national project known as “VET Training Products for the 21st century” (Joint Steering Committee of the National Quality Council and the Council of Australian Governments, 2009). The term “training products” referred to the different “components” of CBT (Training Packages, qualifications, units of competency) and this term is still in use today. In the project, different approaches to CBT were considered, but were not supported by the stakeholders who were consulted.

Training Packages, then, seemed to have general support. The main advantages (as listed in Smith, 2010), compared with previous 1990s CBT curriculum models, were considered to be that Training Packages allowed more autonomy for training providers and teachers, that they could be adapted for specific uses such as training in companies, that they did include at least a cursory acknowledgment of what was called “underpinning knowledge”, and that assessment could be holistic, both within units of competency and, theoretically across units of competency. However, arguments against CBT continued to be made, including arguments about the dominance of assessment over learning (Gillis and Griffin, 2005; and, in the UK; Torrance, 2012).

During this second decade, grading in competency-based assessment, which was reasonably common in the early days of CBT and had even grown during the first decade (Smith and Keating, 2003), began to disappear. The problem with grading was that extremely explicit criteria were presented as being necessary for grading above the pass level of “competent” (Gillis and Griffin, 2005), a seemingly highly technical task that was beyond the capabilities of most RTOs.

During the 2000s, changes occurred to the bodies which developed Training Packages. The network of national and State ITABs collapsed first, as the Commonwealth government removed funding in 2002 from State ITABs, which had been co-funded by national and State governments. Then in 2003, national ITABs were replaced by Industry Skills Councils. There were only 11 of these, replacing 29 national ITABs in existence in 2003 (Smith and Keating, 2003). As the Industry Skills Councils (ISCs) necessarily covered a range of industries, each ISC established a number of industry sub-committees. The role of the ISCs was to develop, maintain and review national Training Packages, and to undertake a number of ancillary activities, including the development of what

were known as “Training Package support materials” which typically included teacher guides to delivering the material, and learner workbooks.

Initially, training providers were excluded from the governing bodies of VET and from Training Package development processes, with those responsible claiming that industry should own all processes, but this decision was reversed during the decade, with training providers allowed to participate in important committees and to comment on Training Packages. The Boards of ISCs included employer and trade union representatives, who were sometimes at odds over the content and format of Training Packages and qualifications, with trade unions, for example, seeking to protect industrial relations privileges including preferential arrangements for apprenticeships (Smith, 2010). Even after Training Packages had passed this barrier, further steps needed to be followed. Firstly, all State and Territory governments had to be consulted and then the new or revised Training Package was submitted to a national committee.

One feature of the 2000s was the introduction of skill sets (Mills et al., 2012). Since the beginning of the Training Package system, formal certificates called “statements of attainment” could always be issued by training providers for individual units of competency or groups of units. In this decade, the name of “skill sets” was conferred upon groups of units. Skill sets could be designated either by training providers or, more formally, by Industry Skills Councils along with Training Packages (Mills et al., 2012). Essentially these “bundles” of units of competency—what might now be called micro-credentials—were intended to meet specific industry or worker needs.

The third decade of CBT

Overview: In this third decade, there were major CBT-related policy developments: Industry Skills Councils were supplanted, in a battle over industry control of the process of developing competency standards; and a new regulatory body was introduced. In curriculum developments, the format of units of competency was changed, a decision whose ramifications were broader than might be expected as will be explained later; and there were changes to the way competency-based assessment was policed.

Industry Skills Councils (ISCs) were abolished after only 12 years of existence, and replaced in 2015 by a new model where Training Packages were developed by “Industry Reference Committees” which were “serviced” by “Skills Service Organizations” (SSOs). For example, the author is a member of the Industry Reference Committee for the Training Package for VET teachers, the Training and Education Training Package. While some former ISCs gained contracts to become SSOs, others did not. The reason for this change was not publicly stated, but a presentation by a senior official of an industry peak body, ACCI, at an international conference (Lambert, 2016) provides some insight. Lambert stated that some ISCs had become “self-interested” and had become “masters rather than servants of industry.” As stated earlier, ACCI was a proponent of CBT from the early 1990s. The new system was quickly found to be flawed (Joyce, 2019) and SSO contracts were only renewed until the end of 2021.

During this third decade, the 2010s, ASQA, the national regulatory body for VET, was established. As explained earlier, ASQA was set up in 2011 to provide a national auditing function for RTOs. “RTO Standards” were instituted for this purpose, with a revised set of standards in 2015; RTOs are obliged to adhere to the standards to gain or maintain registration. These standards do not contain direct reference to Training Packages, but there are guidelines for each standard which are quite prescriptive about, for example, what RTOs’ curriculum documents derived from Training Package qualifications (known as “Training and Assessment Strategies”) should look like. In these guidelines, Training Packages are explicitly referenced (e.g. <https://www.asqa.gov.au/standards/training-assessment/clauses-1.1-to-1.4-2>). ASQA auditors also expect to see “mapping documents”, which show how assessment processes address every item mentioned in the unit of competency and its associated “assessment requirements” document.

In the 2010s, Training Packages, and particularly units of competency, changed their appearance and content. In response to complaints about the length and the jargon-ridden nature of the units, during the first half of the decade they were “simplified,” which perhaps ironically led to a lengthy bureaucratic process as units were progressively “simplified.” A consequence of this change was that “assessment requirements” were decoupled from the units. This was reported to have been undertaken because some employers might want to deliver the content contained in the units, but not assess. An unfortunate result was that the “knowledge” section of units of competency, always skimpy, was removed from the unit and placed into the “assessment requirements” document. During this decade, commonly-occurring units of competency known as “Working effectively in the [e.g. retail] industry”, including knowledge about the industry as a whole, were also removed from Training Package qualifications, as, it was argued, they did not describe a work role. This further reduced the “knowledge” contained in Training Packages. Finally there was a successful attempt in the 2010s to reduce the number of Training Packages, as some were rarely utilized.

Assessment was identified during this third decade as a major problem with the VET system (e.g. Department of Education & Training [DET], 2016). Industry reportedly complained of a lack of confidence in assessment, and AQSA, the regulator, found assessment problems in key industry areas through strategic audits. Attempts were made in the 2015 RTO standards (Department of Education and Training, 2017) to tighten up the definition of assessment, even incorporating in the legislated standards some difficult-to-interpret “rules” and “principles” proposed by assessment “experts.” The perceived problem was so bad that “external assessments” were mooted as one possible “solution” to the problem, i.e. removing from RTOs the ability to assess their own students (DET, 2016). While this was not introduced, other measures were. During this decade immensely complicated “assessment tools” (ASQA, 2015) became the required norm in VET; these documents, often 20 pages or more, included minutiae of how to assess the units, including all the tasks, instructions for teachers, arrangements for keeping all the “evidence” for many years,

and so on. The 2015 standards also introduced a requirement for all RTOs to undertake an “ongoing systematic validation of assessment practices and judgments”; every 5 years all assessment tools had to be “validated,” and moderation of results undertaken. Again this process was highly complex, tightly specified within the standards, and imperfectly understood in the VET sector. Finally, assessment decision-making was identified as a major problem in the sector during this decade (Clayton, 2013), with teachers routinely reporting difficulty in deciding whether to pass students or not.

What is the current nature of CBT curriculum?

After these three decades, what does competency-based training look like in Australia? In 2020 there were 57 Training Packages (www.training.gov.au, viewed 27.9.20). These contained 1047 qualifications, 16,784 units of competency. 1439 formal skill sets had been endorsed. They are common in certain industries and for certain cohorts; for example 11 of them are in community Aboriginal health. The parallel system of accredited courses had generated 680 qualifications. Rules called the Standards for Training Packages (Department of Industry, 2012) govern Training Packages (<https://docs.employment.gov.au/documents/standards-training-packages>).

Each Training Package on the “National Register of VET” contains three components. This is explained on the web site of the Australian Skills Quality Authority (ASQA) thus:

- “Units of competency define the skills and knowledge needed, and how to apply them in a workplace context.
- A qualifications framework contains groups of units of competency used to develop learning outcomes. These groupings range from Certificate I to Graduate Diploma level.
- Assessment guidelines cover the qualifications required by assessors, the design of assessment processes and guidelines for assessment management. Assessment guidelines explain the industry’s preferred approach to assessment” (<https://www.asqa.gov.au/about/vet-sector/training-packages>).

As explained above, during the third decade of CBT, units of competency were divided into the units themselves and separate documents called “assessment requirements” for each unit. The content of both documents is shown on the web page for each unit of competency. The content and layout of Training Packages are themselves governed by their own national standards (Department of Education Skills & Employment, 2012). Units of competency have some sections of content which are compulsory, and a few which are non-compulsory. Non-compulsory sections include a listing of pre-requisite units and the “range of conditions,” which describes the context for the task described in the unit. The core of each unit is “elements” and “performance criteria.” According to the Department of Education Skills & Employment (2012),

Elements describe the essential outcomes; elements describe actions or outcomes that are demonstrable and assessable. Performance criteria describe the performance needed to demonstrate achievement of the element. 1.1 Performance criteria clearly relate to the element. 1.2 They are expressed as a standard. 1.3 They specify the required performance in relevant tasks, roles, and skills. 1.4 They reflect the applied knowledge that enables competent performance

In practice, performance criteria generally read more like sub-sections of the elements.

Appendix 1 illustrates the above requirements with extracts from two units of competency: one for changing wheels and tyres and one for infection control. Elements and performance criteria are presented in the Appendix, together with the “knowledge” section from the “assessment requirements” documents for the units. These items essentially represent the content to be taught; Training Packages are not allowed to provide any information about how to deliver the training.

The units selected for the Appendix include a very simple and short unit, “Remove and replace wheel and tyre assemblies” used in low-level automotive qualifications, and a larger unit, “Comply with infection prevention and control policies and procedures”. Both units are quite small. There are no specified hours of delivery, as this is forbidden in the Training Package standards, but units are assigned “nominal hours” by State governments for funding purposes, which are taken as a rough guide to appropriate hours for delivery. The two units in Appendix 2 are quite small, 10 and 25 nominal hours respectively; most units of competency, in fact, have between 40 and 60 “nominal hours”.

Appendix 1 illustrates the odd language that persists in units of competency, despite “simplification” of Training Packages. It will be noted that the elements and performance criteria are written in the passive voice and describe tasks performed in workplaces. They read more like detailed job descriptions—for example “Potential hazards and risks associated with task are identified and reported to workplace supervisor” than curriculum for training. The knowledge requirements sections, with their sections and sub-sections provide only a list of “bits” of knowledge, with no coherent explanation nor a picture of the overall body of knowledge that is to be imparted to students. Knowledge sections vary considerably among units, with some, in fact, containing virtually nothing.

The other vital part of the unit for curriculum development is the “assessment conditions” section in the “assessment requirements” document. This section sometimes provides some clues about delivery, for example about whether there should be a work

placement associated with the unit. However, there is still no guidance about how to determine whether a student is competent or not, despite assessment decision-making having been identified as a problem.

In what ways has the system painted itself into a corner?

From a policy point of view the following statement from a report by one of the key components in the system in the 2010s, the National Skills Standards Council, sums up the developments:

The history of the standards for the regulation of vocational education and training since the early 1990s illustrates how the key features of these initial regulatory and quality frameworks have endured. It also shows that the regulatory system has responded to prevailing policy concerns and perceptions of risk, and moved between being primarily a recognition system with certain prescriptions, to a system adopting an outcomes-based and continuous improvement approach, and reverting back to a system favoring compliance.

National Skills Standards Council [NSSC] (2013: 7).

The NSSC, in this excerpt, summarizes a move away from tight prescription in the 1990s and back again during the early 2010s (and which continued to the end of the 2010s). While the statement refers to policy and regulation, the same pattern can be detected in curriculum. Early, looser perceptions of CBT—“based on industry competency standards or developed with formal industry consultation and written in CBT format”—as described by [Smith et al. \(1996\)](#), quickly became tightened when NFROT began to accredit course curriculum in 1992. But this system lasted for only 5 years. Training Packages removed this accreditation, leaving only industry competency standards as the key component of competency-based training. Discussion of the resultant curriculum needed to deliver training from these standards was actively discouraged, although the need for curriculum was evidenced by the government funding of Training Package support materials in the 2010s, recognizing that many RTOs were not capable of developing curriculum from the industry competency standards.

At the same time, during the 2000s, the average qualification levels of VET teachers began to fall, due to the introduction of a new Training Package Certificate IV qualification for VET teachers. This was designed as a minimum qualification but quickly became the maximum required by RTOs ([Smith and Keating, 2003](#)). As [Hodge \(2014\)](#) points out, teachers lack the skills to work with Training Packages, being unable to interpret units of competency correctly. One commonly reported problem is a perception among teachers that it is forbidden to teach more than the content in the units, thus ensuring that the “taught” or “delivered” curriculum ([Glattthorn, 1987](#)) does not evolve in line with industry developments. The removal of approved curriculum has therefore been problematic. Teachers also worry about the language of “competence.” A CBT qualification does not mean that somebody is competent at work; it means that somebody has passed a course that teaches them certain skills and knowledge. This simple fact needs to be recognized, as it was in the early days of CBT ([Thomson et al., 1996](#)).

A combination of the removal of accreditation for curricula, the degradation of the expertise of the VET teaching workforce (augmented by the national government’s adoption of the term “trainers and assessors” instead of “VET teachers”), together with the financial scandals of the 2010s led to re-imposition of a “system favoring compliance” as the [NSSC \(2013\)](#) stated. The tight specification of assessment processes in the RTO standards of 2015 was a reflection of that. The Standards for RTOs ([DET, 2017](#), p. 8) define assessment as follows:

the process of collecting evidence and making judgments on whether competency has been achieved, to confirm that an individual can perform to the standard required in the workplace, as specified in a training package or VET accredited course.

This definition asks teachers (or “assessors” as they are referred to in this instance) to assert that students (or “candidates” as they are called in assessment jargon) are competent to workplace standards. Of course it is not possible for this assertion to be made, as teachers cannot always accompany students to workplaces (if they have one) and watch them work, even leaving aside the fact that all workplaces have different requirements and standards. Moreover, the skillful task of assessing students is reduced to the task of “collecting evidence.” Very little grading is now practiced in the sector, except for some higher level qualifications; teachers report that it is difficult to encourage high performance when no grading is available; but more worryingly, both students and teachers report that the emphasis on “evidence gathering” means that students often pass who should not.

At the same time as the doomed attempt to ensure assessment quality through tight prescription, there was the assertion of more industry control over curriculum. The “simplification” of Training Packages reduced the emphasis on knowledge and ensured that teachers focused only on skills performance. Industry demands for the abolition of Industry Skills Councils removed the curriculum expertise that had resided in those bodies, replacing them with a system that was intended to reassert industry control. In a move analogous to the introduction of Training Package support materials because curriculum documents were not developed and teachers lacked the skills to develop their own curriculum, the national government introduced a well-hidden “Training Package Quality Assurance Panel” of consultants, after the abolition of Industry Skills Councils, who could be hired to assist Skills Service Organizations in Training Package work. And in fact, it was industry pressure over so-called assessment problems that led to the assessment mis-steps of the 2010s.

Thus while Training Packages were intended to lead to flexibility, the system has become progressively less flexible. As problems began to appear in the system, “reforms” were introduced which painted competency-based training into a smaller and smaller corner of the VET “room”. Moreover, RTOs added extra layers of sticky paint to avert potential audit problems and from a lack of trust of teaching staff, either justified or unjustified. For example, in many large RTOs including TAFE institutes, managers

Fig. 1 How VET curriculum is constrained in Australia.

formerly known as “teaching and Learning managers” and concerned with improvement the quality of teaching delivery, progressively added “quality” to their title and by 2020 most were simply called “quality and compliance” managers. The paperwork required to generate “training and assessment strategies,” “assessment tools” and to carry out the “assessment validation” cycle utterly consumed them and their staff.

Fig. 1 below illustrates the features of the current competency-based system which are preventing the development of good curriculum, and hindering teachers’ ability to assess students confidently and accurately.

Getting out of the corner: how can this situation be improved?

How should the system get out of its corner and escape its constraints? Some researchers who are opponents of the current CBT system (e.g. [Wheelahan, 2016](#)) advocate a jump. They would prefer to see the whole system overturned; in terms of the metaphor they advocate leaving the room altogether. But they do not offer realistic alternatives that acknowledge the day-to-day operations of the VET system. The huge leap that would be required to abandon the current CBT system and enter a new, unpainted, “room” would not be achievable, at least unless it was absolutely clear that everyone found the current system unworkable. But this is not the case; there are many stakeholders in the VET system whose voices cannot be ignored, and many training providers—public and private—who would be adversely affected by needing to rewrite all of their teaching programs.

In this spirit, a small number of improvements are now suggested which would involve the CBT system in Australia tip-toeing out of its current corner. They would undoubtedly involve situations where stakeholders and practitioners would find their feet encountering sticky surfaces, but there would be a relatively light tread involved. The list of improvements is not intended to be exhaustive but provides a way out which would not abandon the CBT system entirely.

Firstly, it needs to be widely understood and promulgated that the content of units of competency is necessary but not necessarily sufficient, and that training providers are free to add extra content. This statement could be easily added into each unit of competency, with little disruption caused.

Secondly, more “knowledge” could readily be inserted into Training Packages. Specific “knowledge units” could be added to the core units for each qualifications. The existing “knowledge” sections for each unit (See [Appendix 1](#)) could immediately be moved from the “assessment requirements” into the unit of competency itself. This would be a “paperwork” exercise that would not cause great disruption, but that would ensure that the knowledge components of units were actually taught. Thirdly, grading in assessment can be instituted. It need not be complex and technical; teachers could be trusted to work within an assessment framework set by their employing RTO, as are university teachers.

Fourthly, a mid-way point is needed between units of competency, which are essentially lists of work activities, and the teaching-learning interaction. The current mandated “training and assessment strategies” are far too prescriptive. Teachers should be left to develop their own unit- and session-level curricula. But an RTO needs to decide an overall teaching strategy for its qualifications, of a similar nature to the “National Framework for the Recognition of Training” curriculum between 1992 and 1997.

Finally, a restoration of the education levels of VET teachers to former levels would better equip teachers to manage the dilemmas associated with competency-based training, and to augment curriculum as required. The low level of qualification for

VET teachers is perhaps a peculiarly Australian problem. Fewer than 25% of VET teachers are now qualified past Certificate IV level in pedagogy (Knight et al., 2020), and only 10% at university level. In the 1980s and 1990s, by contrast, all new full-time teachers in the public (TAFE) system had undertaken in-service teacher-education at universities (Harris, 2020). The gradual decline in the pedagogical qualifications of the VET workforce began, somewhat ironically, with the introduction of the competency-based Certificate IV qualification for VET teachers (Smith, 2021).

Conclusion

The chapter has described the changes in the Australian VET curriculum system which can be described as successive attempts to “fix” problems arising from an originally imperfect model. The competency-based system is outcomes-focused, which in itself is not problematic, but the implementation has been deeply flawed. In general the successive steps have been taken in good faith, and seem to flow logically, but have progressively improved options and reduced quality. Alternative solutions have not been considered because of the influence of powerful stakeholders including industry peak bodies and trade unions. VET researchers have tended to be oppositional rather than constructive, and teachers have been ill-equipped to argue for better solutions due to a lack of formal educational knowledge.

The chapter, based on research and extensive high-level experience in and with the sector, presents a picture of a system in some disarray, due to particular circumstances in the Australian system. The account may be helpful for other countries going through similar processes and debates, or considering reworking their curriculum systems. It is hardly news that curriculum is a political arena (e.g. Print, 1993), and VET has a unique set of strong political actors due to tripartite involvement in most countries (e.g. Deissinger and Gonon, 2015), with employers and trade unions alike claiming ownership of VET systems. Because VET curriculum is thus embedded within other political institutions, a gradual approach to change, including—as in this case—extricating itself from the corner into which the curriculum has become stranded, is the most likely to succeed.

Appendix 1. Extracts from two units of competency (elements and performance criteria only) and assessment requirements (knowledge evidence only)

Source: www.training.gov.au, the national register.

Unit AURTTJ003—“Remove and replace wheel and tyre assemblies”

Parent Training Package: Automotive Retail, Service and Repair. Found in only two qualifications—both at Certificate II level. 10 hours delivery specified in the Victorian Purchasing Guide: <https://www.education.vic.gov.au/training/providers/rto/Pages/purchasingguides.aspx>.

Note: In the absence of Training Package guidance on hours of training delivery, State Government Purchasing Guides are used as a proxy. The guides produced in Victoria are in wide use.

Elements	Performance criteria
Elements describe the essential outcomes	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicized text is used, further information is detailed in the range of conditions section
1. Prepare to remove and replace wheel and tyre assemblies	1.1 <i>Safety requirements</i> are sourced and interpreted 1.2 Task instruction is interpreted and vehicle wheel and tyre assemblies to be worked on are identified 1.3 Manufacturer specifications and workplace procedures for removing and replacing wheel and tyre assembly are sourced and interpreted 1.4 Potential hazards and risks associated with task are identified and reported to workplace supervisor 1.5 <i>Tools and equipment</i> required for wheel and tyre assembly removal and replacement are identified according to manufacturer specifications
2. Remove and inspect vehicle wheel and tyre assemblies	2.1 Tools, equipment and materials are selected and checked prior to use according to manufacturer specifications and safety requirements 2.2 <i>Vehicle</i> is prepared for wheel removal according to workplace procedures and safety requirements 2.3 <i>Wheel and tyre assemblies</i> are removed according to workplace procedures and manufacturer specifications, and without causing damage to components, tools or equipment 2.4 Wheel and tyre assemblies are identified and inspected according to manufacturer specifications 2.5 Wheel and tyre assembly inspection results are recorded

(Continued)

<i>Elements</i>	<i>Performance criteria</i>
3. Replace wheel and tyre assemblies	3.1 Wheel and tyre assemblies are prepared for replacement 3.2 Wheel and tyre assemblies are replaced according to workplace procedures, manufacturer specifications and safety requirements without causing damage to components, tools or equipment 3.3 Wheel and tyre assembly on vehicle is checked for correct operation
4. Complete work processes	4.1 Final inspection is made to ensure work meets task instruction and workplace standards, and vehicle wheels and tyres are presented ready for use or storage according to workplace procedures 4.2 Work area is cleaned, waste and non-recyclable materials are disposed of, and recyclable material is collected and stored according to environmental requirements and workplace procedures 4.3 Tools and equipment are checked and stored according to workplace procedures, or tagged and reported where necessary 4.4 Workplace documentation is processed according to workplace procedures

Knowledge evidence

Individuals must be able to demonstrate knowledge of:

- key aspects of work health and safety (WHS) and occupational health and safety (OHS) requirements, including:
 - use of personal protective equipment, including safety glasses, ear protection and safety footwear
 - use of hand tools and lifting equipment
 - procedures for handling wheel and tyre assemblies
- types and application of wheel assemblies, including:
 - stamped or pressed steel wheels
 - alloy wheels
 - wheel studs and nuts
 - tyres, including cross-ply and radial tyres
- inspection procedures for tyre and wheel assemblies, including wheel inspection and tyre wear
- removal and replacement procedures and precautions
- tyre air pressure setting and test procedures
- work area clean-up and maintenance requirements.

Unit HLTINF001—“Comply with infection prevention and control policies and procedures”

Parent Training Package: Health. Found in 38 qualifications: Certificate II to Diploma level. 25 hours delivery specified in the Victorian Purchasing Guide.

<i>Element</i>	<i>Performance criteria</i>
Elements define the essential outcomes	Performance criteria describe the performance needed to demonstrate achievement of the element
1. Follow standard and additional precautions for infection prevention and control	1.1 Follow hand hygiene practices in accordance with organizations policies and procedures 1.2 Implement hand care procedures and cover cuts and abrasions 1.3 Follow organization procedures for choice and use of personal protection equipment 1.4 Follow procedures for respiratory hygiene and cough etiquette 1.5 Follow procedures for environmental cleaning 1.6 Follow procedures for handling, transporting and processing of linen in a manner that controls the spread of infection 1.7 Follow procedures for disposal of contaminated waste 1.8 Follow procedures for handling and cleaning client equipment that prevents skin and mucous membrane exposures, contamination of clothing, and transfer of pathogens 1.9 Identify and respond to situations where additional precautions may be required to prevent transmission of infection

(Continued)

<i>Element</i>	<i>Performance criteria</i>
2. Identify infection hazards and assess risks	2.1 Identify infection hazards associated with own role and work environment 2.2 Identify own areas of responsibility in relation to infection prevention and control 2.3 Assess risk by determining the likelihood and severity of harm from identified hazards. 2.4 Document and report activities and tasks that put self, clients, visitors and/or other workers at risk 2.5 Identify appropriate control measures to minimize risk in accordance with organizations procedures
3. Follow procedures for managing risks associated with specific hazards	3.1 Follow protocols for care after exposure to blood or other body fluids as required 3.2 Place appropriate signs when and where appropriate 3.3 Remove spills in accordance with the policies and procedures of the organization 3.4 Minimize contamination of materials, equipment and instruments by aerosols and splatter 3.5 Identify, separate and maintain clean and contaminated zones 3.6 Confine records, materials and medicaments to a well-designated clean zone 3.7 Confine contaminated instruments and equipment to a well-designated contaminated zone

Knowledge evidence

The candidate must be able to demonstrate essential knowledge required to effectively complete tasks outlined in elements and performance criteria of this unit, manage tasks and manage contingencies in the context of the work role. This includes knowledge of:

- established guidelines for the prevention and control of infection, including those for:
 - personal and hand hygiene:
 - how to hand wash
 - how to hand rub
 - pre-surgical hand preparation
 - clinical moments when hand hygiene should be performed with soap and water rather than alcohol-based hand rub
 - non-clinical moments for hand hygiene hand care, including guidelines on maintaining intact skin, fingernails and jewellery/watches
 - use and scope of personal protective equipment guidelines for:
 - glove use
 - wearing gowns and waterproof aprons
 - wearing masks
 - wearing protective glasses
 - surface cleaning:
 - cleaning procedures and their specified times
 - routine surface cleaning
 - managing a blood or body fluid spill
 - sharps handling and disposal techniques
 - reprocessing procedures for equipment
- types of additional precautions and their relevance to particular areas of work or client groups
- types of hazards in the work environment and associated risks and control measures
- chain of infection:
 - source of infectious agent
 - mode of transmission
 - susceptible host
- basis of infection, including:
 - bacteria and bacterial spores
 - difference between harmless microorganisms and pathogens
 - difference between colonization, infection and disease

- fungi
- viruses
- key modes of disease transmission—contact, airborne and droplet:
 - paths of transmission including direct contact, aerosols and penetrating injuries
 - risk of acquisition
 - sources of infecting microorganisms including persons who are carriers, in the incubation phase of the disease or those who are acutely ill
- factors that increase the susceptibility to infection:
 - immune status
 - wounds or devices
 - medications and comorbidities
 - age

Introduction

The discourse on quality teaching as an enabler of student success has brought into focus issues around teacher identity in higher education. Although there has been considerable research on the identity of teachers in the schooling system (Beauchamp and Thomas, 2010; Akkerman and Meijer, 2011; Flores and Day, 2006; Stenberg, 2010), there have been only a few studies of lecturer identity in higher education (Archer, 2008; Clegg, 2008; Lea and Stierer, 2009). Global movements including massification, rising costs in higher education and advances in communication technology have brought the issue of quality teaching to center stage (Mok and Welch, 2003). The emergence of a knowledge-based economy requires that higher education re-imagines its character and purpose (Burbules and Torres, 2000; Jaffer et al., 2007; Scott et al., 2007; Bozalek et al., 2013). Diversity in the student population and increased access and participation rates require that higher education responds adequately to increasing demands.

Professional identity in education

Based on the social constructivist approach, identity is characterized as the social and cultural self, shaped by life experiences and through reflecting on these experiences with oneself and others (Swennen et al., 2008). In the study of “identity,” the level of consciousness about one’s identity and the extent of agency in its “construction” are essential questions to consider. Identity is not fixed but evolves over time (Beijaard et al., 2004). Identity building is inclusionary: each individual interacts in many socially and culturally created and distinct worlds which are continuously socially organized and replicated (Swennen et al., 2008). The formation of identity takes place in an inter-subjective field and is an ongoing process of self-interpretation and acknowledgment in a particular context (Gee, 2001). According to Wenger (1998), identity is created by involvement in various communities of practice, deliberately and unintentionally.

Professional identity as individual interaction is one element of the individual self-concept that is formed by a conversation between the self and outside reality in a social context (Hermans and Dimaggio, 2007). Thus, professional identity is always relational depending on the context and position in which one finds her/himself. By selecting and/or rejecting other possibilities, a person confirms affiliations in a variety of professional fields and distinguishes those which are an essential component of her career: her identity (Coldron and Smith, 1999). Kreber (2010) indicates that teacher identities are formed by the complex relationship between personal teaching theories and self-perceptions, both mediated by social and career background.

Globally, discourse on teacher identities has gained prominence as higher education evolves and as demands increase. There is more scrutiny of how shifting roles, pedagogy and values shape academics’ professional identities (McNaughton and Billot, 2016; Trautwein, 2018). Locally, academic developers such as Jawitz (2009) and Leibowitz et al. (2005) have raised concerns about the impact of global changes on the professional identity and development of university teachers, especially in the complex context of post-apartheid South Africa. This study aims to expand on the global discourse on teacher identity, using South Africa as a case study. Traditionally, literature on teacher identity tends to reflect views from the global north. It is important to engage in research

which contributes to the discourse on teacher identity from a perspective relevant to the conditions of the global south. For this purpose, the study explores the following timely and important questions:

1. How have the changing nature of higher education and increasing demands affected/shaped teacher/lecturer identity within higher education?
2. How has this identity shift impacted on teacher practices and ultimately student outcomes?

Research on teacher identity argues that current demands on university teachers have affected the ability to develop and build a clear professional identity (Thomas and Beauchamp, 2011; Jawitz, 2009). Formation of identity is an ongoing process of perception and reinterpretation of experiences (Beijaard et al., 2004, 2000) and is a complex process of learning which is continuous and affects personal history, social interactions and cultural and psychological factors (Lamote and Engels, 2010). MacLure (1993) argues that the self and identity are fundamental to teaching and professional growth suggesting that teachers use identities to explain, justify and understand themselves with others and to the world as a whole.

“Being” a good university teacher

Elements that affect professional identity formation are closely associated with conceptions of the ideal person as a professional and the principles on which the ideal person is based (Verhofstadt-Deneve, 2003). According to Laurila and Kukkonen (2003), the creation of the teacher’s identity can be interpreted as seeking a balance and resolving the contradictions between the ideal self and the real self. In understanding the dynamics of the teacher’s development process, it is therefore important to see identity from two perspectives: the idea of an “ideal” self and the real self (Beauchamp and Thomas, 2010).

An individual’s ideal identity consists of the ideal image of what she wants to be (Ruyter and Conroy, 2002). Each teacher has an image of ideal teachers and their values and skills (Arnon and Reichel, 2007). The ideal is a measure of the assessment of realistic activities of a teacher, personal as well as technical. It is an “ideal” that serves as a potential future and a sum of the desired qualities of a teacher. This idea is backed by possible-self theory (Markus and Nurius, 1986), explaining the significance and the dynamics of self-relevant, forward-looking concepts and how these contribute to motivation for present and future actions. These self-conceptions relate to how people think about their potential and future and may reflect a person’s expectations: the hopes, dreams, fears and threats that they foresee in the near or more distant future (Hamman et al., 2010).

In the view of Markus and Nurius (1986), potential roles themselves perform essential purposes leading to current behavior, reflect the “picture” of what one wants to become and serve as a “behavioral blueprint.” Individuals who are aware of what they want to become will be more likely to follow their interests and goals (Hamman et al., 2010). Holding an idea of your future self and understanding the complex forces that can impact the future can allow teachers to track their progress (Beauchamp and Thomas, 2010). Fletcher (2000) explains how the teacher’s values can be transformative both by conceiving a particular purpose as a potential teacher (for example: to be caring and efficient) and by the motivational value of finding and anticipating the nature of the teacher.

Increasingly, studies show the role that socio-cultural and political factors play in shaping the professional identity of university teachers (Lasky, 2005; Phyak and Baral, 2019). As Freire (in Giroux, 2010, 715) argues, the pedagogical foundations of higher education institutions are “a deeply civic, political, and moral practice.” In South Africa, transformation has been a key factor that has shaped the pedagogical orientation of higher education and university teacher identity has had to be reconstructed around the transformative agenda of post-apartheid South Africa. As previous studies show (Beauchamp and Thomas, 2010; Hamman et al., 2010; Arnon and Reichel, 2007), the interpretation of the good teacher is a significant part of the ideal teacher. Ruyter and Conroy (2002) found that, in their study, the majority of students with a Bachelor of Education qualification listed personal characteristics such as being polite, truthful, accessible and natural as the features of their ideal instructor. Likewise, Strage’s (2008) research found that the features most used by undergraduates to represent their ideal professor were: educated, fun, caring and student-oriented. A teacher’s personal experience of learning in the sense of her/his experiences (positive or negative) not only affects her/his image but also forms her/his cognition of the ideal school or university teacher.

In their research, Arnon and Reichel (2007) found that teacher’s expectations of an ideal teacher include professional personality consisting of both subject-matter expertise and didactic skills. Karjalainen and Nissilä (2008), in their work with university teachers, describe the qualities of an ideal university teacher across three key fields: teaching abilities, teacher personality and subject matter expertise. The three dimensions are shaped and negotiated through the socio-cultural and political context to construct the “ideal” university teacher.

Literature on teacher education (Loughran, 2002; Freese, 2006) indicates a strong relationship between reflection and identity development. According to Johns (1995), the process of reflection helps people to consider and assess their experiences. Korthagen and Vasalos (2005) understand reflection as a process focused on actions to create awareness, which is informed by the social reality and the intrinsic qualities of the subject. Farrell (2011) defines reflection as a key component of the self-concept because it takes implicit concepts to a level of consciousness. In other words, when there is no thinking, it is difficult to talk for yourself.

Lamote and Engels (2010) note that it is important to focus also on the kind of teachers that university teachers want to be in the course of the growth of their professional identities. Furthermore, teacher identity formation means that teachers explore potential

perspectives on their task and professional growth, known as anticipatory reflection (Beijaard et al., 2004). While retrospective thought is based on memory, anticipatory reflection contains an element of imagination which looks forward to an opportunity that the student-teacher may create (Beuchamp and Thomas, 2010). This study reflects on lecturer beliefs about what makes a good or “ideal” teacher in relation to quality teaching.

Constructivism and social practice

This study¹ employs Sin’s (2014) concept of the “policy object.” According to Sin, this describes not the actual policy text but its core dimensions or concepts; actors’ beliefs about the policy object will influence how they enact policy and impact policy outcomes. Sin’s “policy object” is drawn from two theories: Berger and Luckmann’s (1966) social construction of reality and the social practices perspectives of Bamber et al. (2009). Both the social construction of reality and the social practice approach acknowledge the significant role that actors and context play in the way that “shared knowledge and collective symbolic structures of knowledge and the way meaning is ascribed to the world enable certain interpretations of reality and practice” (Sin, 2014, 438).

In the social construction of reality, reality and knowledge are transmitted and maintained in social situations (Berger and Luckmann, 1966). The main tenet of social constructionism is the duality of reality: that the world is created not given and is both subjective and objective (Berger and Luckmann, 1966). In this case, reality is produced by social action as it appears to the individual as separate and independent from her/him, although it is the result of subjectively meaningful actions (Berger and Luckmann, 1966). Social practice theory views actions as practices that have been conditioned by the socially shared structures of knowledge which lead to certain interpretations of reality and behaviors (Bamber et al., 2009, 7–8). As Ball (1994, 22) states “discourse speaks to us” and shapes the policy positions that are taken.

In the academic context, social practice theory relates to a process where people working together develop understandings, values, attitudes and practices particular to their context (Bamber et al., 2009). The social practice approach adopts a socio-cultural lens to explain daily practices; thus “social practice” is used as the unit of analysis. This study, therefore, provides an important opportunity to explore how the implementation of teaching and learning policies shape lecturer enactment toward good teaching.

Methods

The Ph.D. research on which this paper is based was a multi-level and multi-case study, collaborative and reflective in nature. Five universities were selected according to the following criteria: rural, disadvantaged and teaching focused; institutional type (merged, comprehensive, traditional); location (rural or urban); focus (teaching, research or both). The criteria used in the study reflect the kinds of institutions in South Africa in relation to geography, access to resources, student population and focus. This allowed for a more nuanced understanding of how context shapes the enactment of teaching.

The Ph.D. study was qualitative in nature. Qualitative research provides a framework for understanding social or human problems based on building a complex, holistic picture, formed with words, reporting detailed views of informants and conducted in a natural setting (Creswell, 1998; Denzin and Lincoln, 2000). This ontological view of reality is in line with the theoretical approach adopted for the study which sees reality as being a result of social interactions. Qualitative research allows us to answer descriptive questions about “what is happening” and “what or how it is happening” (Shavelson and Towne, 2002, 99). Qualitative research, therefore, acknowledges the social way in which reality is created and made sense of and attempts to obtain insights into particular social process and practices within a context (Connolly, 1998).

A multi-case study approach was taken, informed by a number of case study methodologies. According to Yin (2003, 47) a multiple case study either “(a) predicts similar results (a literal replication) or (b) predicts contrasting results but for predictable reasons (a theoretical replication).” As Yin (1994, 31) indicates, “a previously developed theory is used as a template with which to compare the empirical results of the case study. If two or more cases are shown to support the same theory, replication may be claimed. Empirical results may be considered yet more potent if two or more cases support the same theory but do not support an equally plausible rival theory.” A case is defined as “a unit of human activity embedded in the real world; which can only be studied or understood in context; which exists in the here and now; that merges in with its context so that precise boundaries are difficult to draw” (Yin, 1994, 13). An argument for case studies in qualitative research is that they make it possible to consider contextual conditions (Şebnem, 2009); in this study, the case study design provided a framework for exploring how social processes and practices, in a specific context, shape the professional identity of university academics as teachers.

¹This paper is drawn from a doctoral study with a social constructivist and practice orientation. It was a sub-study within a larger National Research Foundation project which aimed to strengthen staff development in the institutional context using Margaret Archer’s social realist theory. Structure, culture and agency as important elements of social realist theory provided an important foundation for the Ph.D. study. Ethical clearance for the study was obtained from each of the participating institutions. All information identifying specific individuals was removed at the stage of transcription. The data was thereafter archived electronically. Only individuals who conducted the interviews know the identity of the interviewees.

Forty-nine semi-structured interviews were conducted with teaching academics selected according to a predetermined matrix of criteria: gender, faculty, “race,” seniority, nationality. Thematic analysis was employed as the analytical framework of the study. Data coding was carried out, with themes used as a guide for further analysis of data. The themes initially created assisted in the unifying and clarifying of ideas (Anderson et al., 2003).

Results

Personal dispositions and intrinsic factors

The study revealed that university teachers’ professional identity is linked to personal and intrinsic dispositions and attitudes. In particular, the positive orientation shaped by their internal locus of control toward teaching is an important element of their identity as teachers.

but I think, for me personally, it’s more of intrinsic motivation. I want to be a good lecturer because I love it. I love it when I see the students suddenly realize how something fits together and, you know, the sort of the penny drops, so to speak [L11].

I really enjoy what I do, I love working with students and I love the idea that, that I’m actually building skill that’s useful in the workplace [L49].

Personal values such as passion, commitment and love are described as key to shaping lecturer teaching practice. These are reflected in student-centered, transformative and developmental approaches to teaching.

So my orientation towards teaching is really about people. It’s about building relationships that will enable them to develop character, skills, transferable skills and also to develop a passion for the things that I love, which is chemistry [L14].

Intrinsic attributes contribute to how teaching is perceived and experienced and the commitment that lecturers have to good teaching practice. Hence, personal values shape teacher orientations toward teaching (interactive teaching, peer group learning) which are associated with effective teaching.

[H]ere is the natural chemistry between people, individuals and groups of people, but I really enjoy teaching. I really enjoy being in that classroom and interacting with the students. I also think that it’s a very creative space or can be and that I’ve often tried out new things and I’ve been quick to abandon things that don’t work well, and I’d say that although there has been a framework of continuity in my actual teaching approach; teaching materials and so on [L3].

The study revealed the key role that personal values play in teachers’ perceptions and experiences of teaching; and that values interact with other elements in the teaching environment to shape enactment.

“Becoming” a good teacher

Interestingly, “becoming” a good lecturer emerged as an important component of good teaching. Quality teaching appears to be understood as a process of “becoming” and/or “being” rather than a static event. Being a good lecturer appears to be understood as a developmental process and cumulative in nature. Some lecturers acknowledged the impact that time and history play in shaping one’s pedagogical practices.

I believe that teaching is a spiral process or teaching and learning is a spiral process so when one teaches you to teach at this level and then you come back and you teach the same thing but you’re going into deeper and deeper and deeper levels of it. So, it’s cumulative teaching but going in a spiral movement and I also think that I’m as much a learner as I am a lecturer because I learn from the students, every day. I learn from them [L9].

An inherent characteristic of being a good lecturer appears to be one’s ability to keep up with the demands of the evolving higher education context and, by extension, society.

I really enjoy being in that classroom and interacting with the students. I also think that it’s a very creative space or can be and that I’ve often tried out new things and I’ve been quick to abandon things that don’t work well, and I’d say that although there has been a framework of continuity in my actual teaching approach; teaching materials and so on—it’s been an experience of constant change as well [L3].

The ability to teach well is therefore defined not only by internal attributes but, more so, by external factors which demand continuous reflection and improvement. The professional identity of the lecturer is thus always evolving.

According to the findings from this study, beliefs about what it means to teach well or what it means to be a good teacher can be summarized through seven key concepts: transformative learning, student-centered approaches, pedagogy, curriculum, internal motivation and becoming a good lecturer. Underlying all these concepts is the significant impact that context has on shaping what it means to teach well. As a result, what emerges is the multi-dimensional nature of quality teaching. We cannot underplay the role that both lecturers and students play in ensuring that learning takes place. Thus, the relational nature of good teaching emerges as a crucial component.

What does this mean for higher education? It is clear that the political context of South Africa continues to shape higher education, with the transformative agenda remaining at the center of development. Pedagogical practices in higher education cannot be understood outside the civic, political and a moral imperatives (Freire, in Giroux, 2010), and the relational nature of good teaching demands that lecturers see teaching as more than a technical exercise.

Professional development

Perhaps not surprisingly, the study reveals professional development as an important mechanism for developing one's identity and skills as a university teacher. In particular, respondents identified workshops and seminars as important not only for reflecting on teaching practices but also creating a community of practice.

You know seminar sessions, things like the assessor's course, the teaching portfolio for me was huge in really getting me to take seriously a reflection you know to invest in it and then share that with the community that I work in [L18].

Peer networks as communities of practice were also identified as important spaces for sharing good practices. Lecturers said that peer networks allowed them to share experiences, learn about good practices and develop as academics by engaging critically on teaching and learning issues with fellow academics.

What I have been doing is attending conferences and presenting what I'm doing. Because what I have found, I learn better from sharing with other people. So, when people share their own experiences, then I can be able to actually see ... or are you doing it this way, how can I do it better. That's the only way that I feel that I learn best, by interacting with intellectuals, academics and other professionals with the same interests [L32].

The study shows the role that critical friends play in a lecturer's development as a university teacher. Peer interaction and critical feedback emerged as vital mechanisms for improving teaching practices. Communities of practice, in particular, were singled out as stimulating dialog and innovation in the classroom. A considerable number of lecturers mentioned that they engage with peers as critical friends in the classroom to get critical feedback to improve teaching practices.

I think speaking with my older colleagues in the department and asking them questions about particular things like, you know, how to set out the module and using older modules for similar courses that I was teaching, to try and get a sense of what it is that they had done [L19].

We co-teach for six months. And that is a fantastic experience because I like co-teaching, it helps one also to simplify. In humanities, we sit in on each other's lectures, that's one of the hallmarks of the course [L38].

Because critical friends appear to play a significant role in shaping teaching practices in the process of becoming a good lecturer, institutions are increasingly creating spaces and structures that facilitate peer interaction and dialog on teaching and learning.

Well, we do have, we do have those conversations in our staff meetings and we each year in our department we have a curriculum workshop that we have for the whole day. Trying to revise how the teaching takes place, how the modules are set up. But I think there could be more, I think more awareness about the issue. Because I can't change one way to benefit the student and someone else is doing something else. So, I think it definitely can improve [L17].

Interestingly, communities of practice appear to transcend departmental disciplinary and institutional boundaries. This is significant for creating a system with a shared understanding of good teaching practices.

But if I start looking at where the support comes from it first comes from, we have a really good national network within the profession. And good networks with other universities so and that's a good supportive environment Because it's a great team of people and there are really exceptional educators who I learn from all the time, the other lecturers that I work with, highly motivated. Also looking to improve, looking to do things better, looking for student feedback and student input so that we can sort of speak back to those things [L4].

The study signals the potential role that communities of practice may play in shaping lecturer identities as good teachers and in developing shared and common understandings of good teaching. This is important in a context where many lecturers find formal professional development activities to be ill-equipped, irrelevant and not responsive to their needs.

Something we don't do enough of is think critically about teaching beyond the introductory level, so all the workshops and discussions that happen at [the institution] tend to happen very much at the introductory level [L45].

Some lecturers reported that facilitators do not always have the expertise (qualifications and knowledge) to facilitate professional development activities.

I definitely, I think, I think you need the qualifications and obviously those qualifications must be given by people who are accredited and actually know what they're teaching. It can't just be a course for the sake of a course. It has to be thorough and that, you know peers and everyone can say yes, we believe in this course, we believe in the value of what's being taught [L16].

Apart from the lack of capacity in professional development, workload issues appear to negatively impact lecturers' ability to participate in professional development activities. Respondents mentioned that the timing of developmental activities often conflicted with teaching time.

Since the beginning of the year, the institution has been phenomenal in the number of trainings that they provide to lecturers to attend. The only problem is that they schedule it when I am teaching and then I am like, I am not going to give up my lecturing time with my students to go and train [L21].

because I think even the workload might affect how you embrace a lot of things, because if you are teaching a huge number, it tends to affect how you avail yourself to such opportunities [L27].

The findings reveal how structural and material conditions within institutions interact with personal values to affect the professional identity of university lecturers and enactment of good teaching.

Discussion

The multifaceted nature of teaching and learning demands that the identity of university teachers evolves with and responds to the current need to produce critical thinkers who are socially conscious for the 21st century labor market. “Ideals,” including identity, are complex and their roots and survival are shaped in a relevant context by personal interests, experiences and outcomes (Hamman et al., 2010). Identities evolve with the time and experience of teaching as professional identities grow. Consequently, at the heart of good teaching is the understanding that the ability to teach well is a process of “being” and “becoming.” The identity of the university lecturer, unlike teachers in the schooling system, has not been well understood (Beijaard et al., 2000; Beauchamp and Thomas, 2009). University lecturers are primarily appointed as disciplinary experts but are also expected to fulfill the teaching role. Therefore, the professional identity of the university lecturer is mainly formed and shaped in practice (in-service). The university lecturer “becomes” a teacher in practice. The process of professionalizing university teachers therefore involves not only what they know (discipline) and can do (skills) but also who they are becoming (Dall'alba, 2009). It does not happen in a vacuum but is mediated by the political, social and personal. Current professional development initiatives often neglect to reflect how university teachers navigate the political and socio-cultural influences which often shape how university academics develop as teachers and how they negotiate these in practice. Research reported by Thomas and Beauchamp (2007) stresses the significance of sociocultural factors in understanding how teachers negotiate their personal and professional selves in relation to the broader socio-political and institutional conditions. This gap is reflected in the development of one-size-fits-all, generic professional development programs. As Badat and Sayed (2014) advocate, professional development of university teachers should be done using rigorously conceptualized and designed academic development programs. Although the process of becoming is often facilitated by continuous professional development, one would question whether the current professional development models reflect the “becoming”

nature of good teachers. This study found that many lecturers experience professional development to be highly fragmented and not responsive to their needs. This negatively impacts identity formation of the academic as a teacher. Furthermore, the research and teaching nexus tension continues to constrain the development of academics as lecturers. Although institutional priorities vary, there is a concern that research is more highly valued than teaching. Chalmers' (2011), for example, found that university lecturers felt that their institutions prioritized research at the expense of teaching and learning.

Lecturers also argue that universities send out mixed messages especially when promotions, performance and publications are prioritized over teaching (Clarke et al., 2012, 10). Van Lankveld et al. (2017, 326) echo this by stating that undervaluation of teaching leads to tensions in academics' identity as lecturers and feelings of insecurity and reduced self-esteem. This is another example of how structural and material conditions within institutions constrain the promotion of good teaching. Herman and Cilliers (2008) indicate how the status of teaching has implications for academics' professional learning and the extent to which they seek to enhance their teaching practice. With increasing pressures and competing priorities, academics are more likely to engage in activities on which they are appraised and for which they are rewarded. Ball (2003) describes the current conundrum faced by university lecturers as one where they have to contend with numerous changes as professionals: “the struggle for the soul of the lecturer.”

Such research findings reflect the contested nature of how academics construct and re-construct their professional identity. However, Bathmaker and Avis (2005) argue that lecturer identity in itself is not the main issue but rather the way in which it shapes and contributes to how teaching and learning is enacted. It is therefore important to understand the elements that shape lecturer identity to understand how they shape conceptions and enactment of teaching.

Consistent with international practices, professional development emerges as an important activity for developing academics as lecturers. However, disciplinary expertise remains the main focus of professional development in South Africa. It may be argued that professional development is still shaped by the socio-political transformative imperatives of a post-democratic dispensation. Pedagogy remains on the periphery in higher education. This is in contrast to international practices increasingly recognizing the significant role that pedagogical training plays in shaping good teaching practices. Institutions continue to develop academics using traditional and formal methods: short courses and workshops by expert academic developers (Laat and Schreurs, 2013). This approach has been found to be less effective in developing academics as lecturers (Knapper, 2003). As observed in this study, traditional approaches to professional development have not been effective in developing lecturers because they tend to be designed with a one-size-fits-all approach, often lacking depth and expertise and conflicting with teaching time. As Smith and Kanuka (2018) have indicated, professional development activities tend to be generic. Its voluntary nature may also impact participation due to competing priorities within higher education.

Framing professional development as a social practice is important as studies have shown that the context within which academics work has a considerable influence on practice (Leibowitz et al., 2014). However, professional development approaches do not reflect current discourse which highlights the role that informal social networks play in how academics develop, learn, interpret, embrace, share, compile, contextualize and sustain new knowledge (Baker-Doyle and Yoon, 2011). Boud and Hager (2012) advance the notion that professional development models should be developed to locate learning in professional, day-to-day practice:

Learning is a normal part of working, and indeed [of] most other social activities. It occurs through practice in work settings from addressing the challenges and problems that arise. Most learning takes place not through formalized activities, but through the exigencies of practise with peers and others, drawing on expertise that is accessed in response to need. Problem-solving in which participants tackle challenges which progressively extend their existing capabilities and learn with and from each other appears to be a common and frequent form of naturalistic development (2012, 22).

In devising professional development models, we need to understand that learning in networks is beneficial for professionals (Harasim et al., 1995; Goodyear et al., 2004) and is a productive approach to professional development (Baker-Doyle and Yoon, 2011). However, learning communities can only be successful if they have a shared vision and institutional support. As Van der Linden et al. (2000) state, shared and supportive leadership, shared vision and values and shared learning collectively are important elements for learning communities. This has implications for policy design and signals the need for collaborative partnerships and engagement between a range of key stakeholders at different levels (Hudson et al., 2019). However, collaborative partnerships and engagement are complex and require that stakeholders with differing priorities establish common ground.

Conclusion

This study reflects on the need for greater insight into and scrutiny of the identity of university teachers. Increasing demands, technological advancements, funding, managerialism and the contested nature of higher education requires that we interrogate the (re) construction of teacher identities within higher education. It is important that we interrogate how university teachers navigate and negotiate the demands placed on them and how these shape and impact their practices. This will inform the development of responsive and contextually relevant professional development models.

The study contributes to current debates on teacher identity by expanding on the conceptual and methodological tools by using a constructivist and practice-based approach. It emphasizes the dynamic nature of teacher identity and requires us look at site-specific socio-cultural and political factors to understand how they construct or attempt to construct their professional identity; including what enables or constrains the development of a “healthy” identity.

In summary, this study reveals that teacher identities are always in a state of evolution, shaping and (re) shaping the nature and purpose of pedagogy. Locally, university teachers must negotiate, navigate and respond to the transformative agenda for a post-democratic dispensation, declining funding and technological advancements within a contested socio-political landscape. This pressure is compounded by the fact that university teachers are required to respond to low throughput rates and to improve student success. What does this mean for professional development? In South Africa, professional development models have reflected traditional and one-size-fits-all approaches. This study argues for a new way of theorizing professional development and the “university teacher” and the development of models which reflect the increasingly complex nature of teacher identity and the demands placed on them. The implications of this study have wider relevance for higher education across the world because of increasing changes and demands. The study contributes to a broader knowledge base and more nuanced understanding of teacher identity for the development of content, design and implementation of professional development models that are relevant and responsive to student success.

Introduction

Early Career Academics (ECAs) are not new to research. Countries like Australia, New Zealand, UK, Japan, the USA, Canada and South Africa, among others, are way ahead with research. Scholars have opened conversations on various aspects, ranging from support and guidance, capacity building, funding, workload, retention of academics, career development and challenges ECAs encounter. Entering the academic world is challenging to ECAs. Nevertheless, higher education institutions expect their academic staff to publish papers as it benefits them and the wider academy. The need to understand ECAs' experiences, prospects and challenges cannot be overemphasized. So much is written on ECAs in other countries and contexts, but little remains known about Namibian ECAs. There is a dearth of literature on the issue. Due to the scarcity of literature and conversations in Namibia on ECAs and reflecting on our journeys as Early Career Researchers (ECRs's), we decided to open up a conversation with Namibian ECAs. And to address this gap, we share in this article the Namibian ECRs' experiences concerning their development into experienced researchers, including their prospects of becoming experienced researchers, as well as challenges hindering them from becoming experienced researchers.

Drawing on the popular aphorism 'publish or perish, this article draws attention to the challenge of ECRs' capacity to publish research papers in peer-reviewed journals (Shinkafi, 2020) in order to develop experienced researchers (Akerlind, 2008). Scholars continue to converse on the kind of support ECRs need to research and publish. Scholars argue that ECRs are inexperienced researchers who require guidance, support, and mentoring (Shinkafi, 2020) to excel in academia.

The article begins with conceptualizing ECRs by putting it into context and distinguishing between two related terms, ECAs and ECRs. We use a narrative method embedded with quantitative data to tell the story of Namibian ECRs' journeys of becoming seasoned researchers. We then explain the methodology informing our research, and ECRs' experiences, prospects, and challenges are thereafter presented and discussed.

Early career researchers in context

There is no agreed definition of what constitutes an ECA (Price et al., 2015 in Masinga et al., 2016). McAlpine and Åkerlind (2010) further exacerbate the complexity of the term ECA in terms of what they do and how they develop as academics. Hemmings (2012) views ECAs as academics who are within their first five years as members of staff in Higher Education Institutions (HEIs) those with limited experience in academia (Price et al., 2015). Similarly, Vajoczki et al. (2011, p. 75) defines ECAs as those in the first five years of their academic appointment, the period they should develop an academic profile in teaching, research and administration. However, the nature of appointments differ from post-doctoral researchers or teaching fellows to probationary academics, pre-tenured faculty members, to Doctor of Philosophy (PhD) students with teaching responsibilities (Lesenyeho et al., 2018).

Researchers do not draw a clear distinction between the dyads ECAs and ECRs, and some tend to use the two terms interchangeably. However, Haddow and Hammarfelt (2019) indicate that ECAs are those 'heavily' involved in teaching after obtaining their PhDs; whereas, ECRs are the ones that spend 'most' of their time on research. This article is very specific on ECRs and focuses on post-doctoral researchers who are yet to develop their academic profile in research (Vajoczki et al., 2011).

We adopt Bazeley (2003, p. 274) definition of an ECR as one "who is currently within his/her first five years of academic or other research-related employment allowing uninterrupted, stable research development following completion of their postgraduate research training". Developing as a researcher is understood as a process comprising four categories, characterized by confidence, recognition, productivity and sophistication (Akerlind 2008). Becoming a confident researcher entails that one has acquired skills to do research successfully and the confidence of being on the right track with one's research. The category of becoming a recognized researcher, Akerlind (2008) explains, is marked by recognition by other scholars of a researcher's contribution in one's field of study and to the academic community at large. The next category, becoming a productive researcher is marked by increasing productivity

and accumulation of research over time, and this is measured by one's research output. The last category, becoming a sophisticated researcher is increasing one's knowledge horizons and theoretical understanding, and increased sophistication as a researcher.

A sophisticated researcher is an elite (Dalton et al., 1977) and a leading researcher (Woolley et al. 2016). When researchers reach the 'experienced researcher' stage, it means that they have reached the 'most complex' understanding and a great enhancement in doing research (Åkerlind, 2008). Reaching this stage means that a researcher has developed through the three stages of being a confident researcher, a recognized researcher, and a productive researcher (Åkerlind, 2008). Experienced researchers do better research and become research experts (Åkerlind, 2008). In addition, they shape the direction of the knowledge production of their community (Gläser and Laudel, 2015) and develop a strategic vision on the future of the research field (Woolley et al., 2016). Furthermore, experienced researchers contribute substantially to their research field (Woolley et al., 2016) since they reach a theoretical understanding and become aware of broader perspectives (Åkerlind, 2008). Finally, they publish and present influential research papers and books (Woolley et al., 2016).

Literature on early career researchers: experiences, challenges and prospects

ECRs irrespective of whether in Africa or developed countries experience challenges during their journeys of becoming seasoned researchers (Shinkafi, 2020). However, Africa is worse, as Shinkafi (2020) argues, institutions do not pay much attention to the development of ECRs. This could be attributed to the magnitude of challenges African ECRs face as compared to their counterparts in developed countries (Tumwiyukye et al., 2013).

ECRs in Africa struggle gaining funds even if they have a "solid range of knowledge and skills" (Bell et al., 2016, p. 3) in their disciplines. According to Shinkafi (2020), research funds for ECRs in Africa are limited and most funding agencies only fund senior researchers. According to Locke et al. (2018), choosing a career inside academia due to the high pressure to publish in high impact journals is challenging to young ECRs. Resultantly, some highly skilled ECRs who opt for a career outside of academia (Flinders and Anderson, 2019). Stiles and McCulloch (2017) state that collaborative work environments and flexibility are some of the reasons why ECRs prefer to pursue careers outside of academia. Therefore, a systemic change to research cultures within academia is needed in order to retain young academics in academia without being more competitive and exploitative (Bailey et al., 2020).

Brennan et al. (2020) claim that a number of universities worldwide adopt 'teaching, research and administration' approaches. For instance, in most universities in the United Kingdom and overseas, ECRs are expected to teach, conduct scientific research and demonstrate leadership as part of the universities' development (Bailey et al., 2020, p. 2). This approach does not benefit ECAs as they miss out on research opportunities due to their teaching workload (Graham, 2015). Thus, a UK based study revealed that in most universities teaching without integrating research adds no value into lecturers' promotion requirements and this frustrates young academics when they are unable to conduct research (Graham, 2015).

Career instability is one of the stressful aspects that ECRs are faced with (Heaney et al., 2019). According to Bozzon et al. (2016) and Christian et al. (2021) many postdoctoral fellows in academic settings encounter job insecurity. They also have difficulties in acquiring better permanent posts or contract posts even outside of academia. Bozzon et al. (2016) stress that a higher degree of job instability and uncertainty in academic context is not necessarily as a result of the inexperience of ECRs but mostly constituted by a "growing competition for permanent positions and, as a consequence, by a greatly increased pressure" (p. 3). Furthermore, Heaney et al. (2019) indicate that in many countries, ECRs are normally "employed in insecure forms of employment" and offered the so-called 'no tenured' on their first position and this comes with conditions (Nissen et al., 2020, p. 9). According to Heaney et al. (2019), some of the conditions are that ECRs are required to source research funds and publish a certain number of articles regardless of quality. And if they fail to meet the requirements, they can certainly lose their jobs. And with such conditions, many ECRs might see themselves as incompetent and "often feel hopeless" (Heaney et al., 2019, p. 10). As a result, ECRs are left with no option rather than withdraw from leaving their research careers (Christian et al., 2021) and search for new employment opportunities outside of academia.

Mobility of ECRs within academia is another challenge. Despite the availability of job opportunities, Guthrie et al. (2017, p. 5) indicate that "the desire to develop international research networks and collaborations, and to access specific expertise, resources or prestige that allow researchers to progress their careers" are some of the factors that drive ECRs to mobility in academia. In other words, job security, availability of research funding and grants are the major drivers of researcher mobility choices (Guthrie et al., 2017). According to Pugh and Thomas (2018), mobility raises up many concerns ranging from personal lives to research and professional lives. Thus, research mobility is lower in women as compared to men in academia because of family commitments. As a result, young female researchers find it difficult to navigate the globe in searching of career opportunities to broaden their research horizons (Pugh and Thomas, 2018).

Developing the skill of an independent researcher requires a good knowledge base and abilities (Laudel and Gläser, 2007) particularly good writing skills, yet a skill always lacking among postgraduates candidates, coupled with good writing skills is publishing (Almatarneh et al., 2018).

Publishing is considered an important activity for academics and universities as a measure for performance and a criterion for academic promotion and competitive research funding (Kamler, 2008). Hemmings and Kay, (2007) demonstrated that lecturers who publish are appointed in 'more' senior academic positions. Similarly, Kamler (2008) argues that unpublished research results deny the academic field opportunities of professional dialog and knowledge building. Despite the irreplaceable role publications play, publication outputs remain generally low (McGrail et al., 2006; Lee and Kamler, 2007) due to lack of momentum, motivation and confidence, and a lack of framework to support writing (McGrail et al., 2006), as well as barriers such as workload, lack of support, and an under-developed research culture (Hemmings et al., 2007).

The role networking plays in academia cannot be overemphasized. Scholars refer to networking within academia as ‘predictor of career success’ (Blickle et al., 2009), and a way of ‘getting ahead’ (Wolff and Moser, 2009) but not easily acquired by ECRs (Camedda et al., 2017). However, due to the well-researched need of networking skills to ECRs (de Janasz and Forret, 2008; Ansmann et al., 2014) the acquisition of these skills should be one of the priorities of ECRs. However, scholars argue that networking does not happen by itself; it develops through concerted effort and participation in dedicated-focused initiatives (Camedda et al., 2017).

Kirk and Lipscombe (2019) alluded that novice researchers are faced with many challenges during publications and co-authorship opportunities are regarded as the positive developmental strategies to support ECRs in their research careers. Broström (2019) stresses that for the ECRs to receive credit for the work published; they should rather co-author with respected supervisors who gained reputation on research work within the wider scientific community. However, co-authorship has its own challenges such as who should get an authorship credit for the published work between the ECRs and supervisors (Macfarlane et al., 2017). In many cases, “all persons designated as authors should qualify for authorship and all those who qualify should be listed” and share the authorship’s reputational credit (Albert and Wager, 2003, p. 34). In China for instance, ECRs keenly want to be the first or corresponding authors other than their supervisors, so that “their work can be recognized by their institutes and funders” (Nicholas et al., 2018, p. 208). And to be listed as the first or corresponding author; it means that such a person should take the full responsibility for the published research work (Albert and Wager, 2003). Moreover, Minhas, (2021) argues that there is a need to provide public awareness among the ECRs about the authorship ethics and criteria involved when ECRs and supervisors are co-authoring the research work for publications.

Methodology

The study used mixed methods research through a combination of qualitative and quantitative research approaches. The embedded mixed method design was used to gain an insight into ECRs’ personal experiences, prospects, as well as challenges faced on becoming experienced and seasoned researchers. This design embeds qualitative components within quantitative design (Cresswell, 2014) in a supportive secondary role which enables the researchers to make sense of the study as a whole (Almalki, 2016).

Data were collected through an on-line questionnaire and semi-structured interviews (McMillan and Schumacher, 2010). Semi-structured interviews were preferred as they allow for the modification of the questions during the interview (Ary et al., 2010). The data collection procedure was preceded by the piloting of the data collection instruments for validity purposes. The population consisted of Namibian postdoctoral candidates who completed their doctoral degrees within the past five years irrespective of the field of study and institution. Participants were either in HEIs or outside HEIs in both academic and non-academic environments.

Snowball sampling (Parker et al., 2019) was used to find qualifying participants. Three qualifying participants formed the initial contacts to which the questionnaire link was sent with a cover letter specifying ethical issues. These recommended other potential participants who were willing to be part of the study, and the process was replicated until saturation was reached (Guest et al., 2020). Saturation was determined when there were no more new respondents in two weeks. The questionnaire remained active for one month. Twenty-eight respondents completed the questionnaire. A database of respondents was kept and this assisted in identifying interviewees. Out of the total sample, 25% (7) were conveniently sampled (Etikan et al., 2016) on the basis of willingness and availability. The semi-structured interviews were done virtually via ZOOM as well as telephonic. Thematic content analysis was employed to analyze qualitative data; and Microsoft Forms, a web application, assisted with the analysis of quantitative data.

Namibian ECRs’ experiences, prospects and challenges

Research Profile: All participants were ECRs whose profiles ranged from one to eight years after graduation, with the newly graduates (1–3 years) being in the majority. Fields of study included Education, Curriculum Studies, Education Management, Humanities, Social Sciences, Public Health, Natural Sciences, and Mathematics Education. ECRs’ growth in research skills and knowledge since obtaining their doctoral degrees differed. Some were satisfied with their growth, while to others the growth was slow, or non-existent. Satisfactory growth was attributed to, among others, self-motivation and curiosity to learn, interest in research, and belief in continued growth beyond PhD. Those that experienced stagnation or slow growth attributed this to lack of incentives for research in Namibia, work overload particularly in academic institutions, lack of direction on how to proceed beyond PhD, lack of support and guidance, and lack of interest in research among others.

Publication status: As other scholars argue, publishing is considered an important activity for academics and universities; it is a measure for performance and a criterion for academic promotion and competitive research funding (Kamler, 2008). The majority (66.7%) of the participants’ dissertations were published, and only 33.3% were not. Out of the published theses, 11.1% published whole dissertations and the majority (89.9%) published articles from their dissertation.

Research milestones: Among milestones reached, publishing was flagged by many (27%); followed by student supervision (23%), and 22% collaborating with supervisors. The lowest rated (10%) milestone was the other category, for instance tutoring and assisting postgraduate students with research work, and thesis examination. In addition to the ECRs’ milestones reached after obtaining their doctorate degree, the researchers also wanted them to narrate their mentoring and supervision ability in relation to

their research capacity building. Some participants narrated their successful achievements of supervising student research at both undergraduate and postgraduate levels with 100% completion rate.

Furthermore, the researchers wanted to know whether participants were envisaging becoming research supervisors or mentors. All participants eagerly envisaged becoming research supervisors or to continue supervising students. Enhancement of research knowledge and skills was cited by many; others viewed this from the support and guidance to students' perspective as they felt that being a research supervisor or mentor you render the needed support and motivation to students.

Research support: To become an experienced researcher, supervisor or mentor, scholars (Locke et al., 2018; Shinkafi, 2020) argue for research support and guidance. Some ECRs attested that they had not been receiving any support and guidance. Lack of support and guidance was attributed to non-academic environments by others. They felt that non-academic environments do not provide research support and training unlike academic environments. In the absence of support, others had devoted themselves to self-support initiatives. Others attested that they had been receiving support whose quality was at varying degrees. A total of 60% of the participants rated the quality of research support they received as poor to very poor. However, the remaining 40% were satisfied and rated the support as good (25.7%) to quite good (14.3%).

Other research related skills: It seems that not only research support is needed by ECRs to become experienced researchers, research supervisors or mentors, but other research related skills too as part of their growth in academia. Research related skills included among others, writing research proposals for grants and funding, enhancement on qualitative and quantitative research methods, referencing styles, advances in Information and Communication Technology (ICT) use for data analysis, and various theories and practices within the research discipline. The need for refresher workshops was cited by many as a platform for the enhancement of research related skills. ECRs felt that through such workshops, researchers share research knowledge, skills and best practice, and funding opportunities.

Motivation to study for a doctoral degree: Participants who were motivated to pursue their doctoral degrees because they wanted to improve their career prospects to become researchers topped the list (20.8%); this was followed by a tie of those that were encouraged by their former academic supervisors and the prestige of becoming a doctor in an academic field (18.9%). 9.4% studied because of available funding, and 7.5% because the opportunity to do a doctoral degree was available to them. The remaining reasons, interest in the subject, improving prospects of becoming lecturer, considering it as a natural step, and current job requirements each scored 5.7%. Each was the motivating factor. However, the available opportunity to do a doctoral degree was 9.4%. In spite of the stated motivating aspects, only 1.9% of the participants had other motivating reasons.

Career aspirations: More than half (50%) of the respondents aspired to work in higher education institutions after completing their doctoral degree focusing mainly on teaching and research. Equally, respondents who were interested to work in the institutions of higher learning primarily for research only and those that aspired to become self-employed totaled to 14.8% each. And 18.5% of the respondents aspired to take up teaching positions in higher education institutions.

Current and future job prospects: A tie of 18.2% was on research jobs outside higher education and teaching either in or outside higher education. 13.6% of the respondents indicated that their job in higher education included both teaching and research; and those who were self-employed and who were pursuing post-doc studies counted 9.1% each. The lowest percentage (4.5%) was those whose primary job in higher education was research. None of the respondents was unemployed. Future prospects in the next five years included aspirations of becoming associate professors/professors, research consultants (edit research papers, assist ECRs to publish), research supervisors, and experts in research methods with the ability to mentor ECRs.

Presence in other scholars' work: Only 27% of the participants indicated that their research work has been cited by other scholars as compared to the majority (50%) whose research work was not cited, and 23% who could not attest whether their research work was cited by other scholars or not.

Collaboration status: The majority (60%) of the participants were involved in collaborative research, and 40% were not. When asked which collaborators, the majority (67%) collaborated with experienced researchers, mainly to enhance their research knowledge and skills, and the ability to write good publishable research papers in accredited journals. The remaining 33% who collaborated with fellow ECRs had no other choice as experienced researchers and professors were not willing to collaborate with ECRs; others believed in the exchange of research knowledge and skills; while some wanted to expand their research horizons and gain new perspectives on research.

Stages of development: Participants had to indicate the stage at which they were on their journey to become experienced researchers. The majority (65%) of the participants were still at the basic stage of apprentice whereby they needed a mentor to do research; and 35% considered themselves at master stage as they had been mentoring others on research; none of the participants were at colleague and elite stages.

Current research project: The majority (60%) of the respondents were not, at the time of the study, working on a research project, and 40% were working on a research project. When further asked in which research journal would they wish to publish their research work, generally, the majority (90%) wished to published in peer reviewed journals, others specified some journals: Elsevier, Journal for Language Teaching (JLT), Namibian Educational Research Association (NERA), Francis and Taylor, and 10% of the participants had not yet decided.

Number of articles published: Half (50%) of the participants had each published two articles each; 30% each published one article; and a tie of 10% was recorded on participants that published four and five articles. All of these articles were published in peer-reviewed journals.

Non-dissertation-based publications: The researchers were also interested to know whether participants had published articles not based on their PhD dissertation since graduation. Slightly above 50% of the participants had published articles not based on their

dissertations, 40% had not and 7% had submitted articles to journals for possible publication. Of the non-dissertation published articles, 75% were published in peer reviewed journals, and the remaining 25% in non-peer reviewed journals. The set standards and requirements as well as the high cost of publication charges were commonly cited as obstacles. Other reasons included lack of confidence in research knowledge and skills, and the belief that they had to start at that level and move up the ladder of publishing.

Challenges: About a quarter (25.9%) of the participants indicated that all the listed challenges applied to them, namely, carrying independent research, publishing in accredited journals, support and guidance to write publishable research papers, research resources and networking with other scholars. This was followed by 18.5% who pointed at networking with other scholars, 15.8% who identified publishing in accredited journals, 14.8% pointed at research resources; carrying independent research and writing quality research papers without supervision received the lowest responses. Further engagement with them in interviews revealed similar challenges, namely, lack of funding, data analysis, ICT related challenges, and publishing. However, in academia, credit and recognition is given to academic papers published in accredited and reputable journals. In spite of the prestige that comes with publications in accredited journals, Namibian ECRs faced challenges and attributed this to ineffective, or non-existence of mentorship programs, lack of research collaboration opportunities with experienced researchers, lack of guidance and support, lack of funding opportunities, the intensity of comments from reviewers, shortfalls in academic writing genre, lack of publishing skills, and limited publications for ECRs to benchmark on, and the fear of the unknown.

Discussion of findings

Ideally, doctoral dissertations published are/should be cited by other scholars. This study, however, revealed that only a few dissertations were cited by other scholars. In addition, many ECRs collaborated with experienced researchers to gain research knowledge and skills and also the ability to write good publishable research papers in accredited journals. According to McGloin (2018), collaboration is the best practice as it encourages teamwork to share required research. To become an experienced researcher, there are stages to go through. And many participants were still at the basic stage of apprentice whereby they needed a mentor to do research and only few were at the master stage (Laudel and Glaser, 2008). This might be the reason why most of the participants were not working on a research project; even though they wished to publish many of their research papers in peer reviewed journals. According to Akerlind (2008) and Shinkafi (2020), ECAs were aspiring to develop into experienced and sophisticated researchers but lacked capacity to write good research papers and publish in relevant peer-reviewed journals.

To become an experienced researcher requires someone to conduct research and publish few research articles. This concurs with Akerlind (2008) and Shinkafi (2020) who argue that for ECRs to develop into experienced and sophisticated researchers they should be able to research and publish. Thus, the majority of the participants published articles from their dissertations compared to those who published whole dissertations. And this was a milestone reached by ECRs after obtaining their doctoral degrees. Despite the publications, some ECRs had also supervised students, did collaboration work with their supervisors, tutored students and assisted postgraduate students with research work, and thesis examination. For collaboration, McGloin (2018) admits that in some cases, collaboration frustrates and discourages researchers, especially the young academics. In spite of what have been accomplished by ECRs, those in non-academic environments had not been supported and guided after obtaining their doctoral degrees other than self-support initiatives. Furthermore, ECRs indicated that they needed research related skills like writing research proposals for grants and funding, enhancement on qualitative and quantitative research methods, referencing styles, advances in ICT use for data analysis, and various theories and practices within the research discipline. Similarly, Hlengwa (2019) and Marsay (2020) denote that lack of research grants and funding opportunities prevent ECRs outside academia from conducting research. In other words, unavailability of research funding and grants are the major drivers of researcher immobility choices (Guthrie et al., 2017). Participants also needed refresher workshops as a platform to share research knowledge and skills and best practices.

Many ECRs pursued their doctoral degrees because they wanted to improve their career prospects compared to other motivating factors such as being encouraged by their former academic supervisors and the prestige of becoming a doctor and work in higher education. Guthrie et al. (2017, p. v) indicate that “the desire to develop international research networks and collaborations, and to access specific expertise, resources or prestige that allow researchers to progress their careers” inspired students to pursue their doctoral degrees. And all ECRs had future prospects, aspiring to become associate professors, research consultants, research supervisors, and/or experts in research methods with the ability to mentor the upcoming ECRs.

Becoming an ECR comes with challenges especially when one aspires to publish in peer reviewed journals. Thus, in academia, credit and recognition is given to academic papers published in accredited and reputable journals. In support, Hemmings and Kay (2007) demonstrate that lecturers who research and publish are more confident and can be appointed in ‘more’ senior academic positions than those who do not. However, the set standards, requirements and high cost of publication charges were cited by ECRs as obstacles to having their research work published in accredited journals. In spite of the prestige that comes with publications in accredited journals, Namibian ECRs faced challenges and attributed this to ineffective, or non-existence of mentorship programmes, lack of research collaboration opportunities with experienced researchers, lack of guidance and support, and lack of funding opportunities. In support, Bell et al. (2016) state that ECRs are faced with numerous academic challenges including gaining funds even if the ECRs have “solid range of knowledge and skills” in their disciplines (p. 3). In addition, Hlengwa (2019) and Marsay (2020) state that more teaching responsibilities with fewer resources and funding opportunities for research are some of the challenges that prevent ECRs from conducting research.

Conclusion and recommendations

EDITORS IN CHIEF – BIOGRAPHIES

Robert J Tierney

Rob Tierney is an international educator whose passion is for developing research partnerships to address local literacy needs with educators in different countries. Rob began his career as a classroom teacher in Australia, then proceeded to work in the United States, Canada, Australia and China. He is Dean Emeritus and Professor Emeritus of Language and Literacy Education at the University of British Columbia, the former Dean and Honorary Professor of the Faculty of Education and Social Work at University of Sydney, and a Distinguished University Professor at Beijing Normal University. In the United States, he has served on the faculties of the University of Illinois, University of Arizona, The Ohio State University, Harvard University, and the University of California. Rob has written a number of books and numerous articles on literacy especially related to global issues, diversity, and literacy development. His most recent book was entitled *A History of Literacy Education: Waves of Research and Practice* published by Teachers College Press in 2021. During his tenure as an educator, he has served as the President of the International Literacy Association, President of the Literacy Research Association, an Editor for the *Reading Research Quarterly*, the President of the Association of Canadian Deans of Education/ L'Association Canadienne des Doyens et Doyennes d'éducation, as well on a number of committees and boards for professional groups and government and nongovernment

agencies. In addition, he has been involved on a range of groups on projects globally including in Africa and Asia including for UNESCO, Children's Television Workshop, and Apple Computer.

Fazal Rizvi

Fazal Rizvi is an Emeritus Professor of Global Studies in Education at the University of Melbourne, as well as at the University of Illinois at Urbana-Champaign. He is also a Visiting Professor at the Universities of Turku in Finland and Pretoria in South Africa. He has written extensively on issues of identity and culture in transnational contexts, globalization and education policy, and Australia-Asia relations. He has published widely, and his book, coauthored with Bob Lingard, *Globalizing Education Policy* (Routledge 2010) is used widely in courses around the world. A sequel to this book, *Reimagining Globalization and Education* (Routledge 2022) has been published recently. Fazal is currently researching educational reform in Bhutan. He is a Fellow of the Australian Academy of the Social Sciences, a past Editor of the journal, *Discourse: Studies in Cultural Politics of Education*, and a past President of the Australian Association of Research in Education.

**Kadriye Ercikan**

Kadriye Ercikan is Vice President of Research and Measurement Sciences at the Educational Testing Service and Professor Emerita at the University of British Columbia. She is responsible for ETS's foundational and applied research and psychometric support of ETS's major testing products and contracts, and the NAEP contract for ETS. Her research focuses on validity and fairness issues and sociocultural context of assessment. Her recent research includes validation of score meaning using response processes, use of response process data for comparing groups and examining fairness and validity of interpretation, and use of scores from artificial intelligence-based automated scoring.

Ercikan is a Fellow of the International Academy of Education. Her research has resulted in 6 books, 4 special issues of refereed journals, and over 100 publications. She was awarded the AERA Division D Significant Contributions to Educational Measurement and Research Methodology recognition for another

coedited volume, *Generalizing from Educational Research: Beyond Qualitative and Quantitative*

Polarization, and received an Early Career Award from the University of British Columbia. Ercikan has been selected to serve as the NCME Book Series Editor (2021–2026).

Distinguished Professorial Chair, Te Toi Ihorei ki Purehuroa Massey University, Palmerston North. New Zealand

Therese Hopfenbeck

University of Melbourne, Melbourne, Australia

Nataliya Ivankova

The University of Alabama at Birmingham, Alabama, USA

Huia Jahnke

Professor of Māori and Indigenous Education in Te Pūtahi a Toi School of Māori Studies at Massey University, Palmerston North New Zealand

Berit Karseth

Professor at the University of Oslo, Department of Education. Oslo, Norway

Kenneth Leithwood

University at Buffalo, State University of New York, USA

Xiufeng Liu

Emeritus Professor, university of Toronto, Toronto, Canada

Margaret Maaka

Professor, College of Education, University of Hawai'i at Mānoa, Hawai'i, USA

Diane Mayer

Professor Emeritus, University of Oxford, UK

Dan McCaffrey

Educational Testing Service, Princeton, NJ, United States

Judy Parr

University of Auckland, Auckland, New Zealand

Jeong-eun Rhee

Long Island University, New York, USA

Fazal Rizvi

The University of Melbourne, Melbourne, Australia

Theresa Rogers

Professor, Faculty of Education, University of British Columbia, Canada

Chika Sehoole

University of Pretoria, Pretoria, South Africa

Roland Sintos Coloma

Wayne State University, Michigan, USA

Roger Slee

Diamond Jubilee Chair of Disability & Inclusion, School of Sociology & Social Policy, University of Leeds, UK

Ninni Wahlström

Linnaeus University, Växjö, Sweden

Lei Wang

Beijing Normal University, Beijing, China

Everard Weber

Research Associate, South African Chair in Teaching and Learning—UJ Academic Advisor, Future Professors Programme—UJ University of Johannesburg (UJ), Johannesburg, South Africa

Ian Wilkinson

The Ohio State University, University of Auckland, New Zealand

David Yaden

Dept. of Teaching, Learning and Sociocultural Studies, College of Education, University of Arizona, USA

SECTION EDITORS

Jason Beech is Associate Professor (Global Policy) at the University of Melbourne and visiting professor at Universidad de San Andrés in Buenos Aires where he holds a UNESCO Chair in Education for Sustainability and Global Citizenship. He is senior researcher of the National Council for Scientific and Technical Research of Argentina (CONICET), and Associate Editor of *Education Policy Analysis Archives*. He has been a member of the Board of Directors of the Comparative and International Education Society (2014-2016). Jason has published extensively on the globalization of knowledge and policies related to education. He has also written and is passionate about the challenges of educating for global citizenship and a sustainable future. He has taught in several universities in the Americas, Europe and Australia.

Professor Qing Gu is Director of the UCL Centre for Educational Leadership and Professor of Leadership in Education. She is the Past Chair of the *British Association of Comparative and International Education* (BAICE), Co-Editor of *Teachers and Teaching: Theory and Practice*, Associate Editor of *International Journal of Educational Development*, a member of the Research Standing Committee of the World Council of Comparative Education Societies (WCCES), and a member of the Research Evidence and Impact Panel for the Leadership College for UK Government. Professor Gu has directed and codirected many government and research council funded projects in the areas of teacher professional development, school improvement, and systemic reform and change. She has led a £1.9 m UK Economic and Social Research Council (ESRC) funded project *Schools as Enabling Spaces to Improve Learning and Health-Related Quality of Life for Primary School Children in Rural Communities in South Africa*. Some of her books have been translated into Chinese, Japanese, and Spanish.

Professor Smith is a New Zealand Maori of Te Aitanga a Hauiti, Ngati Porou, Kati MamoeNgati Apa, Ngati Kahungunu descent. He is a highly regarded and internationally recognized, Maori educationalist and scholar. He has been at the forefront of transforming Maori and Indigenous social, economic and cultural conditions through re-developing education and schooling outcomes. His work links theoretical thinking and practical applications within an ongoing cycle of transforming praxis.

Professor Smith trained as a teacher at Auckland Teachers College and taught in Auckland schools. He also lectured in Education at the Auckland College of Education. He was one of the first teachers and developers of a Kura Kaupapa Maori, an alternative, Maori philosophy and principles-based School. These Maori immersion schools have grown from a single entity in 1988 to over seventy-five publicly funded schools in 2015. His theoretical leadership in the Education Department at the University of Auckland helped inform the emergence of Maori Education as a distinct field of study across the New Zealand Tertiary Sector. This work has encouraged a wide range of academic studies focused on overthrowing persisting inequities within and as a result of education and schooling in New Zealand. His significant contribution to New Zealand education is to be seen in his work related to Kaupapa Maori as a theory of Transformative Praxis. All of these elements derive from his PhD research entitled, "The Development of Kaupapa Maori: Theory and Praxis (1997)".

Professor Smith's later academic work centered on developing theoretically informed strategies related to transforming high and disproportionate levels of Maori cultural, political, social, educational, and economic marginalization. He has been a significant scholar involved in the emergence of Tribal "university" institutions (Wananga) and is the former foundation Chair of the Council for Te Whare Wananga O Awanuiarangi. He led the successful Treaty of Waitangi Claim and settlement for Awanuiarangi. In his former position as Pro Vice Chancellor (Maori) at the University of Auckland, he was responsible for developing significant structural change within the institution while working within the Office of the then Vice Chancellor, Dr. John Hood. Notable achievements included implementing a Maori development strategy within the University which required all Deans to be responsive in their performance results for Maori and Pacific advancement; the oversight of the Proposal and winning of a National Centre of Research Excellence (Nga Pae o te Maramatanga); the initiation of the Maori and Indigenous doctoral program aimed at creating 500 Maori PhD graduates across the country in five years; the recruitment of top Maori academic scholars into the University of Auckland; the development of Kaupapa Maori as a theory of transformative praxis and which has had national and international influence. Professor Smith also served on the University of Auckland Council for three years as the Professorial representative for Academic staff.

In 2007 Professor Smith accepted a role as the Universitas 21 Distinguished Visiting Professor in Indigenous Education hosted by the University of British Columbia (within the Faculty of Education). Although the position was initially intended for two years, the role was extended for a further three years. While situated at the University of British Columbia, Professor Smith also chaired the Educational Policy Studies Department for three years. These positions allowed engagement with many Canadian universities as well as other universities across the world.

Professor Smith has made significant contributions to the political, social, economic, and cultural advancement of Maori and indigenous communities in New Zealand and around the Pacific Rim. He has worked extensively with other Native/Indigenous/First Nation's peoples across the world, including in Canada, India, US mainland (including extensive work in Hawaii and Alaska), Norway, Taiwan, Chile, Australia, as well as with selected Micronesian and Pacific nations. He is a regular contributor to national and international forums and conferences. Professor Smith has been an authoritative voice within the critical debates on *social, cultural and economic inequality* both in New Zealand and abroad, and he maintains a strong influence in the Maori/Indigenous languages revitalization movements.

Professor Smith stepped down from the administrative position of CEO/Vice Chancellor at Te Whare Wananga o Awanuiarangi in 2015 after eight years in the role. He resumed his academic research and writing career. In 2019 he was invited to take up a special Chair – Te Toi Ihorei ki Purehuroa – A "distinguished Professorial position at large" established for him at Massey University.

Professor Smith has been recognized and honored for his international contributions, receiving an Honorary doctorate (D.Litt.) from the Okanagan University College in 2005, and an Honorary doctorate (LLD) from the University of Northern British Columbia in 2013; he was elected as a Fellow of the American Education Research Association in 2014, and was awarded a Queens Honour – a CNZM in 2014. He was given the Prime Minister's Life-time Achievement Award (2017); and received the Te Ururangi National Award for Education (Matariki Awards, 2019).

Professor Smith is married to Professor Linda Tuhiwai Smith and they have one daughter and two mokopuna (grandchildren).

Therese N. Hopfenbeck is Professor of Measurement Analytics in the Melbourne Graduate School of Education, The University of Melbourne. Before starting her position in Melbourne, she was Professor in Educational Assessment and Director of the Oxford University Centre for Educational Assessment. She is a Visiting Fellow at Kellogg College, University of Oxford, elected Vice-President of *The Association for Educational Assessment-Europe* and Lead Editor of the journal *Assessment in Education, Principle, Policy and Practice*. Dr. Hopfenbeck's research agenda focuses upon bridging research on self-regulation and classroom-based assessment and making sense of international large-scale studies in education. In collaboration with Professor Nancy Perry, University of British Columbia, she is currently leading an international network of researchers disseminating classroom-based research, funded by Social Sciences and Humanities Research Council of Canada (2020–2022). She is also currently Principal Investigator for two research projects funded by IB, on critical thinking in PYP schools internationally and evaluation of education reforms in Kent, UK (2020–2022). In 2020, she led the research on Critical Thinking in the Diploma Program in Australia, England, and Norway (<https://ibo.org/research/outcomes-research/diploma-studies/critical-thinking-skills-of-dp-students/>). Dr. Hopfenbeck was Principal Investigator for the PISA (2022) study in England, Northern Ireland, and Wales, in collaboration with Pearson UK (2018–2023). She was the Research Manager of PIRLS (2016), funded by The Department of Education, UK.gov, and Principal Investigator of a major ESRC-DFID research study, Assessment for Learning in Africa (ES/N010515/1) (2016–2019).

Since coming to Oxford in 2012, she has been the recipient of funding from ESRC-DFID, OECD, The Norwegian Research Council, Education Endowment Foundation, State Examinations Commissions Ireland, Jacob Foundation, and the International Baccalaureate totaling more than £2 mill in addition to a single grant of £4 mill in collaboration with SLATE: Centre for the Science of Learning & Technology at the University of Bergen, Norway. Prior to her appointment at Oxford, she worked as a postdoctoral researcher at the University of Oslo's research group for Measurement and Evaluation of Student Achievement at the Unit for Quantitative Analysis of Education (2010–2011). She is Adjunct Professor of the Norwegian University of Science and Technology (NTNU), member of the Visiting Panel for Research at the Educational Testing Service (ETS) in Princeton, expert member of the PISA (2022) Questionnaire Framework group, appointed by ETS and OECD (2014–2023). She has advised on the implementation of formative assessment programs in India, South Africa, Norway, and the Emirates and carried out policy work for UNESCO/OECD and the Norwegian Ministry of Education Norway. Therese has a presence on LinkedIn, ResearchGate, [Academia.edu](https://www.academia.edu/), and Twitter: @TNHopfenbeck.

Nataliya Ivankova, PhD, MPH, is Professor in the School of Health Professions at the University of Alabama at Birmingham (UAB). As an applied research methodologist working at the intersection of mixed methods, qualitative, community-based, action, and translational research, she is internationally recognized for her empirical and methodological publications. She shares her research expertise through teaching mixed methods and qualitative research courses, conducting workshops and guest lectures, mentoring doctoral students and junior faculty, and serving as key personnel on funded research projects. At UAB, she directs an online graduate certificate program in *Applications of Mixed Methods Research* and oversees the design and analytical aspects of qualitative and mixed methods studies through the Center for Health Informatics for Patient Safety and Quality. She is a founding Coeditor of the *Mixed Methods Research Series* (Sage) and serves as an Associate Editor for the *Journal of Mixed Methods Research*.

Professor Jahnke is Director of Toi Kura Centre for Maori & Indigenous Education. She was the 2019 inaugural Toi o Te Wananga Fellow. Professor Jahnke holds professional qualifications in education and is cofounder and immediate past Chair of the Indigenous Peoples of the Pacific Special Interest Group of the American Education Research Association (AERA). She currently serves on the AERA Executive Committee. She was a member of the Social & Human Sciences Sub Commission of the NZ National Commission for UNESCO, the NZ Bioethics Council, the NZ Ethics Committee on Assisted Reproduction Technology, and Chair of NZ Health Research Council Ethics Committee. She is currently Cochair of the Aotearoa Research Ethics Board and a Fulbright Scholar.

Berit Karseth, PhD, is Professor at the University of Oslo, Department of Education. Karseth's main research and publications lie in the field of education policy, reforms, and curriculum studies. She has edited four books and written several journal articles and book chapters in both Norwegian and English. Her most recent publications in English include articles published in the *Journal of Education Policy*, *Scandinavian Journal of Educational Research*, *Journal of Curriculum Studies*, and *European Educational Research Journal*. Karseth was the elected dean of the Faculty of Educational Sciences at the University of Oslo 2013–2016 and is currently in the leadership team of the research group Curriculum studies, educational leadership, and governance (CLEG) at the same institution.

Dr. Kenneth Leithwood is Emeritus Professor at OISE/University of Toronto and an honorary professor at the University College London and the University of Nottingham. His research and writing is about school leadership, educational policy, and organizational change. He has published extensively on these topics. For example, his most recent books include *Leadership Development on a Large Scale: Lessons for Long-term Success* (2018, Corwin), *How School Leaders Contribute to Student Success* (2017, Springer), and *Linking Leadership to Student Learning* (2012, Jossey Bass). Professor Leithwood is the inaugural recipient of the University of Toronto's *Impact on Public Policy* award, AERA (2011) *Outstanding Leadership Researcher Award*, the 2012 *Roald F. Campbell Lifetime Achievement Award* from the University Council for Educational Administration, and the Ontario Principals' Council *Outstanding Educator of the Year* award for 2017. He is a *Fellow of the Royal Society of Canada*. A recently published bibliometric analysis found that Dr. Leithwood was the most frequently cited, highest impact educational leadership researcher in the world.¹ Research.com's 2022 Ranking of the Top 1000 Scientists in the area of Social Sciences and Humanities ranked Dr. Leithwood 70th in the world and 7th in Canada.

Xiufeng Liu is a Professor of Science Education at State University of New York, Buffalo, and a Fellow of the American Association for the Advancement of Science (AAAS). He obtained his PhD from the University of British Columbia in 1993. Before his current position, he taught high school chemistry in China, and was a tenured faculty member at St. Francis Xavier University and University of Prince Edward Island, both in Canada. From September 2020 to August 2022, he served as a program director in the Division of Research on Learning of the National Science Foundation. Dr. Liu conducts research on measurement and evaluation of STEM education and student learning of cross-cutting concepts of matter and energy. Dr. Liu is currently a Coeditor-in-chief for the journal *Disciplinary and International Science Education Research* (Springer) and an Associate Editor for the *Journal of Research in Science Teaching*, a premier journal in science education.

Margie Maaka is a Professor of Education at the University of Hawai'i at Mānoa. Her PhD is in educational psychology. She also holds professional qualifications in education from the University of Waikato and Hamilton Teachers College. She is cofounder and current Program Chair of the Indigenous Peoples of the Pacific Special Interest Group (SIG) of the American Educational Research Association (AERA). From 2017 to 2020, she served as a member of the AERA Executive Council and Chair of the SIG Executive Committee. Before that (2014–2017), Professor Maaka served as a member of the SIG Executive Committee. She has also served as a member of the Ngā Pae o te Māramatanga Center of Research Excellence International Research Advisory Panel. Her research on community-based educational renewal saw her recognized as a national scholar with the Goodlad Institute for Educational Renewal. As Cochair of the Sovereign Councils of the Hawaiian Homelands Assembly's Committee on Education, she prepared educators and educational leaders for public schools in the Hawaiian Home Lands Trust communities. Currently, Professor Maaka is committed to the preparation of indigenous educational leaders in higher education. Her research interests include community partnerships, educational psychology/indigenous educational psychology, indigenous development and advancement, educational policy, multiliteracies, and language and cognitive development.

Diane Mayer is Professor Emerita at the University of Oxford. Her research and scholarship focus on teacher education and early career teaching, examining issues associated with the policy and practice of teachers' work and teacher education.

Daniel McCaffrey is the Associate Vice President of Psychometric Analysis and Research in the Research and Measurement Science unit of the Research and Development division at ETS. Dan's research interests include the evaluation of artificial intelligence scoring of constructed responses, developing tools and methods for causal modeling, evaluating the psychometric properties of student achievement growth measures derived from annual test scores, and methods to account for measurement error in secondary data analysis. Dan received his PhD in Statistics from North Carolina State University in 1991.

Judy Parr is Professor Emerita at the University of Auckland, Faculty of Education, where she was the founding Head of the School of Curriculum and Pedagogy. A psychologist, Dr. Parr's research program is located broadly within improvement science. Her expertise is in literacy, specifically writing and its development, encompassing instructional issues like teacher knowledge and practice and the assessment of writing. Much research has been collaborative, with colleagues and practitioners within major national projects for school improvement aimed at raising achievement in literacy and, internationally, as part of funded large-scale research projects, for example in Canada and Norway. Dr. Parr has published widely in the areas of literacy, assessment, and professional learning.

Jeong-eun Rhee is a Professor of Education, Long Island University, Post, New York. Born and raised in Seoul, Korea, she earned her bachelor's degree in Educational Psychology from Ewha Women's University. In 1992, she came to the US as an international student and received an MA in Educational Psychology from West Virginia University and a PhD in Educational Policy and Leadership from the Ohio State University. As an interdisciplinary cultural researcher and educator, her recent work focuses on developing and supporting transnational, intergenerational, and decolonial feminist knowledge projects in/through antioppressive education. She recently published *Decolonial Feminist Research: Haunting, Rememory, and Mothers*, which received an honorable mention for the 2022 Qualitative Book Award of International Congress of Qualitative Inquiry.

Fazal Rizvi is an Emeritus Professor of Global Studies in Education at the University of Melbourne, as well as at the University of Illinois at Urbana-Champaign. He is also a Visiting Professor at the Universities of Turku in Finland and Pretoria in South Africa. He has written extensively on issues of identity and culture in transnational contexts, globalization and education policy, and Australia-Asia relations. He has published widely and his book, coauthored with Bob Lingard, *Globalizing Education Policy* (Routledge, 2010), is used widely in courses around the world. A sequel to this book, *Reimagining Globalization and Education* (Routledge, 2022), has been published recently. Fazal is currently researching educational reform in Bhutan. He is a Fellow of the Australian Academy of the Social Sciences, a past Editor of the journal, *Discourse: Studies in Cultural Politics of Education*, and a past President of the Australian Association of Research in Education.

Theresa Rogers is Professor of Language and Literacy Education at the University of British Columbia. Her research interests include youth arts, media and critical literacies, adolescent literature, and teacher education in literacy. Most recently she published "Youth Activism through Critical Arts, Transmedia, and Multiliteracies" in the *Oxford Research Encyclopedia*. She is author of the book, *Youth, Critical Literacies and Civic Engagement: Arts, Media and Literacy in the lives of adolescents* (Routledge) and numerous articles in scholarly journals such as *Literacy Research: Theory, Method and Practice*, *Reading Research Quarterly*, *Pedagogies*, *Language Arts*, *Children's Literature in Education* and *Journal of Literacy Research*. See: <https://ubc.academia.edu/TheresaRogers>.

Professor Chika Sehoole is a Professor of Higher Education and the Dean of the Faculty of Education at the University of Pretoria. He obtained his PhD at the University of the Witwatersrand, Johannesburg, in December 2002. In 2003/4 he was a visiting Rockefeller postdoctoral fellow at the Centre for African Studies at the University of Illinois in Urbana Champaign. In 2005/06 he was a New Century Fulbright Fellow, again, at the same university. His research interests are in the areas of higher education policy, internationalization of higher education, higher education in Africa, and teacher education. He has served in several international research projects focusing on higher education and providing expertise from the South African and African perspectives. In 2013–2017 he served as the Chairperson of the Board of the African Network for Internationalisation of Education (ANIE). He currently serves as the chairperson of the Education Deans' Forum of South Africa. He has published a singled authored book titled "Democratising higher education policy, constraints of reform in post-apartheid South Africa" by (Routledge); three edited scholarly books on higher education and more than 40 articles in journal articles, book chapters, and popular media.

Roland Sintos Coloma is a tenured Full Professor of Teacher Education at Wayne State University in Detroit, Michigan. A scholar of history, cultural studies, and education, his research addresses critical questions of race, gender, and sexuality from transnational and intersectional perspectives. His publications include *Asian Canadian Studies Reader* (2017), *Filipinos in Canada: Disturbing Invisibility* (2012), and *Postcolonial Challenges in Education* (2009). His articles have been published in top-ranked peer-reviewed journals, including *Curriculum Inquiry*, *Discourse: Studies in the Cultural Politics of Education*, *Educational Studies*, *Educational Theory*, *History of Education Quarterly*, *International Journal of Qualitative Studies in Education*, *Paedagogica Historica*, and *Race Ethnicity and Education*. He has successfully garnered over \$2 million of external funding from federal, education, and nonprofit agencies, including the US Department of Education, National Education Association, Spencer Foundation, and Schultz Family Foundation as part of the Bill & Melinda Gates Foundation's Grand Economic Challenges. Roland has served in various university leadership roles as an assistant dean, department chair, graduate coordinator, and center codirector. He was president of the American Educational Studies Association (2018–19), editor of the *Educational Studies* journal (2014–17), and program cochair of Division G (Social Context of Education) in the American Educational Research Association (AERA). He received the 2017 Distinguished Scholar Award from the AERA Research on the Education of Asian Pacific Americans SIG and the 2015 Article of the Year Award from the AERA Queer Studies and Education SIG. In 2020, he was appointed to the Governor of Michigan's statewide Asian Pacific American Affairs Commission. Born in the Philippines and raised in California, he completed his PhD in Cultural Studies in Education and Minor in African American and African Studies from The Ohio State University in 2004.

Roger Slee is the Founding Editor of *The International Journal of Inclusive Education* and *The Journal of Disability Studies in Education*. A former Deputy Director-General of Education in Queensland, Australia, he has advised governments on inclusive education policy and practice. His published books include: *The Irregular School*; *Inclusive Education Isn't Dead, It Just Smells Funny*; and *Ethics and Inclusive Education: Disability, Schooling & Justice* (with Gordon Tait). Roger was commissioned by the UNESCO to write the scoping paper for the 2020 Global Education Monitoring Report, *Inclusion and Education*. Roger also held the Chair of Inclusive Education at the Institute of Education, London, and is now the Diamond Jubilee Professor of Disability & Inclusion in the School of Sociology & Social Policy at the University of Leeds.

Ninni Wahlström is a Professor of Education at Linnæus University, Sweden. Her current research focuses on transnational and national policy discourses and their implications for national curriculum and classroom teaching from a perspective of curriculum theory and educational philosophy. Most recent publications are "School and democratic hope: the school as a space for civic literacy" in *European Educational Research Journal* (2022) and Wahlström (Ed.) *Equity, Teaching Practice and the Curriculum*, Routledge (2022).

Lei Wang is Professor and PHD advisor of the Institute of Chemical Education, the College of Chemistry in Beijing Normal University (BNU). She is also the member of Teaching Steering Committee on Basic Education of Ministry of Education of China and the director of its branch Committee on Secondary Chemistry Education, the director assistant of Faculty of Education of BNU, vice director of the Institute of Science Education of BNU, and Chairman of the Chemistry Education Committee of the Chinese Chemical Society. She is one of the chief experts in developing the *Secondary School Chemistry Curriculum Standards* of MOE. She works as the chief editor of high school chemistry textbooks (Shandong Science and Technology Press, 2004 and 2019 editions) and junior high school chemistry project-based learning textbooks (Shanxi Education Press, 2018 edition). She achieved the first prize of the National Basic Education Teaching Achievement Award, the second prize of the National Higher Education Teaching Achievement Award, and the BAOGANG Education Outstanding Teacher Award.

Everard Weber is a retired professor. He has worked in the field of education for more than 40 years. Currently he is a research associate at the University of Johannesburg (UJ) and an academic advisor in the Future Professors Programme (FPP) at UJ. He studied African Languages and History at the University of Cape Town and Comparative and International Education at Harvard University. In South Africa he has worked at Crestway High School in Cape Town, the University of the Witwatersrand, and the University of Pretoria. A recent book is *A home away from home: a community of international and South African university students*. The FPP is a government-sponsored initiative that seeks to develop the next generation of professors and academic leaders in all disciplines, across all universities in South Africa. He is in addition presently conducting fieldwork on curriculum change in South African higher education with Professor Shireen Motala and Dr. Venise Joubert at UJ. This project is grounded in the history of southern Africa and hopes to contribute to the scholarship of postcolonialism.

Ian A.G. Wilkinson is Professor in the Department of Teaching and Learning at The Ohio State University and Honorary Professor in the School of Curriculum and Pedagogy at the University of Auckland, Aotearoa/New Zealand. He has a background in educational psychology with special interests in cognition, instruction, and research methodology as they relate to the study of literacy. He served as coauthor of the influential report, *Becoming a Nation of Readers* (National Academy of Education, 1985). He was Co-Editor of *Reading Research Quarterly* from 2006 to 2012 and was inducted into the Reading Hall of Fame in 2021. His research examines the impact of classroom discussion and dialogue on students' reading comprehension and argument literacy and the implications for professional development of teachers. Recently he coauthored books include *The Most Reasonable Answer: Helping Students Build Better Arguments Together* and *Quality Talk About Text: Discussion Practices for Talking and Thinking About Text*.

David B. Yaden, Jr., PhD, is the *Jewell M. Lewis Endowed Distinguished Professor of Literacy* in the Department of Teaching, Learning and Sociocultural Studies at the University of Arizona. Prior to his present position at the University of Arizona, he held appointments at Emory University, the University of Houston, and the University of Southern California. He served as Co-Editor of the *Journal of Literacy Research*, one of the premier research journals in the field of literacy studies, and was a Principal Investigator in the federally funded Center for the Improvement of Early Reading Achievement (CIERA) where he implemented an early literacy curriculum for linguistically diverse preschoolers in inner-city Los Angeles. He also directed a statewide consortium of researchers from Arizona's major universities in the evaluation of the state's early childhood initiative to evaluate health, developmental, and educational factors contributing to school readiness. His research interests and specializations include developmental issues in early childhood education, the acquisition of literacy and biliteracy in young emergent bilingual children, family literacy, theories of reading disability, microgenetic research design, and the application of complex adaptive systems theory to growth in reading and writing.

Volume 9: Inclusive Education and Disability Studies in Education

Roger Slee

© 2023 Elsevier Ltd. All rights reserved.

Dedication

This volume of the *International Encyclopedia of Education (4th Edition)* is dedicated to the memory of Dr Anne Hughson, Professor Emerita of the Cumming School of Medicine, The University of Calgary. Psychologist, educator, researcher, disability rights advocate, and community leader, Anne established the first postsecondary education initiative for Canadian disabled people in her home province of Alberta.

Introduction: Education for All in New Times

In *Inadvertent* Karl Ove Knausgaard, a Norwegian writer, engages with the simple question: Why do I write? He admits to “...sitting in front of my desk in southern Sweden for three days without making headway” (Knausgaard, 2018: 1). “Simplicity”, he tells us, “Is treacherous” (Knausgaard, 2018: 1). At first glance inclusive education would appear conceptually simple, elegantly compelling. After all, the right to education is enshrined in international agreements such as the United Nations Convention on the Rights of the Child (United Nations, 1989). Access to and participation in education is offered as a pledge to all children in Sustainable Development Goal 4 (SDG4) (United Nations, 2022a,b). Inclusive education, it follows, is the enabling and safeguarding of that pledge.

Achieving that pledge is some way off. In March 2020 the Director-General of UNESCO, Audrey Auzalay (2020) conservatively estimated that 290 million children were out of school. Quite obviously this figure represented the growing impact of school closures as governments sequentially responded to the global spread of the COVID-19 virus. Nevertheless, prior to the onset of the COVID-19 pandemic, the numbers of children out of school had been cause for concern. One such expression of concern came from the American economist Jeffrey Sachs who commenced the George F. Kneller Lecture to the Comparative and International Education Society in April 2019 to gently register his concern that the assembled educators, and educators in general, maintained such polite quietude when on that day some 250 million children were out of school. Sachs indicated the symbolism of delivering this lecture in San Francisco’s Herbst Auditorium where in 1945 the United Nations Charter was signed foreshadowing the signing 3 years later in 1948 of the “moral charter”: the *Universal Declaration of Human Rights* (United Nations, 1948), in which the right of all to education is inscribed. The problem of children not receiving an education could be resolved, he assured his listeners, through political will and material redistribution through fair taxation.

Who are these educationally excluded children? There are obvious barriers to schooling when “our lives are reeling in the maelstrom of multiple crises,” when “there are malignant winds blowing on this blue planet” (Castells, 2019). Unprecedented levels of population displacement through war; not so natural disasters that speak of accelerating environmental degradation; food insecurity and poverty; the inevitability of mass redundancy driven by the unrelenting global sourcing of cheap labor to reduce production costs and increase profit all erect barriers to education. Childhood labor and marriage; tribal, ethnic, and religious conflict; and the lottery of intersecting identity markers such as geographic location, gender, race, sexuality, language, and disability are at play in excluding children and young people from participation in education. The UNESCO Institute for Statistics (2022) reminds us that estimates of the numbers of children out of school are inadequate because of the invisibility of marginalized population cohorts.

It is important to observe that while the concentration of many of the transnational development organizations is fixed on the countries of the Global South, exclusion from school is a long-standing and resilient problem in the Global North where school remains an active agent in the reproduction of privilege and disadvantage (Connell, 1993; Mowatt, 2022; Picketty, 2022). Like Connell (1994) and Teese (2013) before them, Lamb et al. (2020) at the Mitchell Institute highlight the nonrandom distribution of academic underachievement according to postcode as a proxy for socioeconomic status. Pandemic has trained a spotlight on educational inequality and exclusion with education jurisdictions in countries of the Global North and South expressing concern over the missing or “ghost children” who remain out of school (UK Parliament, 2022).

Simply put, inclusive education may therefore refer to the mitigation or dismantling of barriers to access to and participation and success in education for all children and young people. Inclusive education is not simply a project for getting children into school; it also addresses the differential experiences of children in schools. The experience of schooling may be more or less inclusive: more or less enabling, more or less disabling. We are now beginning to encounter the complexity of this never to be completed project.

Recording a history of inclusive education reminds us of Knausgaard’s struggles with apparent simplicity. In a general sense inclusive education must refer to any initiatives to increase access, presence, participation, and success in education. From this point complexity insinuates itself into our discussion. A relatively modern invention, schooling was not originally intended or designed for everyone (Tait, 2019). Indeed, major changes in the duration of attendance and the substance of curriculum and pedagogy proceed from economic imperative or requirements for specific knowledge and skills in human capital (Apple, 1979). Over time we have seen moves to improve access to and the quality of education for those children and young people marginalized and excluded based on identity markers such as indigeneity, gender, class, race, ethnicity, language, poverty, geographic location,

and disability. The hard-won victories of the civil rights and women's movements demonstrating institutional racism and sexism as barriers to education have been important in the development of critiques of educational exclusion. Understanding formations and mobilizations of exclusion, who's in and who's out, requires acknowledgment of context and a reading of social theory and political economy (Slee, 2011).

As acknowledged, inclusive education is not just a question of access. What happens to children and young people inside schools? Here we enter the complex matrix of overlapping relationships between students and their peers, between students and their teachers, between students and how they are being taught, between students and what they are being taught, and between students and the rituals, routines, and cultures of schools. How do these dynamic relationships affect students? Do they engage or disengage, include or exclude? Understanding the organizations and cultures of schools are central to the theory and practice of inclusive education. Curriculum, pedagogy, assessment, student classification, and stratification are all at play in determining the quality and inclusiveness of educational experiences.

Different population cohorts shaped by geopolitical context and intersecting identity markers have sought to ensure educational access and inclusion. The progress of education theory making, policy-making, and practice has reflected this. Schooling reflects global population movements (Rizvi and Lingard, 2010) and in broad terms we now observe greater population diversity in schools accompanied by discourses of multiculturalism, diversity, and inclusion. Simultaneously, we see intransigent demarcations in and out of schooling according to the erstwhile fault lines of race, ethnicity, class, gender, and disability. Schooling, reflecting neoliberal political economy, is a highly regulated performative enterprise (Ball, 2017). Jurisdictions and individual schools compete against each other to secure higher positions on international and local ranking tables. The unit of measure, student test results, is the incubus for an enveloping ethic of competitive individualism. Students are the bearers of success and risk. In this environment schools, being risk averse, are increasingly selective (Gillborn and Youdell, 1999; Ravitch, 2014; Slee, 2018). As Bauman (2004) counsels, schools produce "surplus populations" who become "collateral casualties" of intensifying competition. Paradoxically, floating discourses of merit, standards, and inclusion are deployed to describe cultures of schooling that must inevitably sift and sort, categorize and regulate, and ultimately exclude students (Ball and Collet-Sabe, 2021).

Inclusive education, therefore, is not what it may appear to be—it is anything but neat. Yes, in many parts of the world there are obviously more children engaged in basic and secondary education than was formerly the case. This is cause for celebration and for intensifying our efforts. Many other children still fall through the cracks and remain invisible. Moreover, the experience of those in school may be less than an inclusive educational experience and this is reflected in data on increasing rates of exclusion and home schooling wherein vulnerable population cohorts loom large (Mowatt, 2022).

Representing Inclusive Education

In this volume of the Fourth Edition of the *International Encyclopedia of Education* I have searched for a way of first representing the work of Inclusive Education writ large and also of one of the strands within that field of education research, policy, and practice: Disability Studies in Education. To that end, I have adopted the catch cry of the 1990 World Conference on Education for All in Jomtien, Thailand (UNESCO, 1990). "Education for All" unambiguously encapsulates the value position of inclusive education—education is the right of all children. Education for All has continued to form the organizing motif for global education to ensure that vulnerable population cohorts such as the girl child, child soldiers and laborers, disabled children, and refugee children secure their right to attend school and participate in a high-quality and inclusive education.

The first group of chapters consider this broader challenge of inclusive education adopting both broader and specific concerns within the inclusive education agenda. The second section of this volume takes up and advances the challenge of "Disability Studies in Education" as a critical concern within the broader field of inclusive education. Many readers coming to this encyclopedia may be puzzled by nomenclature. You might be asking: "Why disability studies in education" and not "special educational needs"? This arose as an issue in communications with prospective contributors and is an ongoing debate in the field. Indeed, in many jurisdictions inclusive education is default vocabulary for special or disabled students, most frequently described as having "special educational needs" following Mary Warnock's (Department for Education and Science, 1978) administrative descriptor. In the education lexicon "special" has and will also represent a point of temporal and spatial separation for specified groups of children. Accordingly, chicanery lurks within the ubiquitous coupling of "inclusive" and "special". Drawing from the transdisciplinarity of critical disability studies, disability studies in education marks a separation from special education's ontological assumptions about impairment, ability, disability, and disablement.

My point is not to demonize special schools and special educators. It is important to return to the beginnings of special schooling to apply perspective. Historically, special schooling exists because of regular neighborhood schools' unwillingness and refusal to enroll and educate disabled children. Parents, medics, and maverick educators went against the grain to insist that "these children" who were considered defective, invalid, and ineducable could learn and be taught (Danforth, 2009). Special schooling at its inception was both a radical resistance to educational foundations and a conservative falling into line with educational structures. It embodies the principle of fairness in ensuring that children who would otherwise remain excluded from education got to attend a school and not remain hidden from the community and other children, but it also energizes ableist assumptions about the nature of impairment, ability, and disability. The systemic bifurcation of normal and special children was complete and stable for decades, each side of the institutional division growing under its own administrative and cultural domain. This deep divide has been unsettled for some time with demands for mainstreaming, integration, and inclusion.

In 1994 representatives from 92 governments and 25 international organizations gathered in the Spanish city of Salamanca and signed the “Salamanca Statement and Framework for Action on Special Needs Education.” It is worth reminding ourselves of two of its guiding principles:

- Those with special educational needs must have access to regular schools which will accommodate them within a child-centered pedagogy capable of meeting those needs.
- Regular schools with this inclusive orientation are the most effective means of combatting discriminatory attitudes, creating welcoming communities, building an inclusive society and achieving education for all ...

(UNESCO, 1994: viii & ix)

Reflecting on the creation and legacy of the “Salamanca Statement and Framework for Action on Special Needs Education” some 25 years later Ainscow et al. (2019) observe that:

The publication of the Salamanca Statement suggested a significant change in policy direction, not least for the education of disabled students. However, the document contains some ambiguities that have become apparent when used in the field. In particular, the deficit orientation of special education discourse continues to undermine more radical moves ... Indeed, this conservative discourse has protected resistance to the reforms it foreshadowed.

General comment No. 4 on Article 24 - the right to inclusive education of the Convention on the Rights of Persons with Disabilities (2016) addresses this by stipulating the requirements of an inclusive education:

It requires an in-depth transformation of education systems in legislation, policy and the mechanisms for financing, administering, designing, delivering and monitoring education.

United Nations (2016).

Herein lies a clarion call for educational transformation. Inclusive education is not an edict for emptying (or merging) special schools into regular schools. The recent public hearings of the Royal Commission into Violence, Abuse, Neglect and Exploitation of People with Disability in Australia provide ample evidence of the failure of neighborhood regular schools to provide an inclusive education for disabled students (Royal Commission into Violence, Abuse, Neglect and Exploitation of people with Disability, 2019, 2020). A key to this transformation is a reconsideration of the knowledge and discourse we employ for that task. The discourse of inclusion has been thoroughly appropriated and deployed to support the conservative interests of a codependent partnership between special and regular education (Tomlinson, 2017) behind a veneer of inclusion. This volume, in advancing disability studies in education, is testing the capacity of disability studies in education to provide critique and reconstruction of the “mechanisms for financing, administering, designing, delivering and monitoring education.”

Returning to the Desk in Southern Sweden

You will remember that I commenced my introduction to this volume with Karl Ove Knausgaard contemplating the simple question: Why do I write? I did so because I was impressed by his observation of the treachery in simplicity and by his need to write to resist “easy thinking and preconceived notions.” It reminded me that I have frequently used the Belgian surrealist painter, René Magritte’s iconic 1929 painting entitled *The Treachery of Images* in which a representation of a pipe is accompanied by the inscription, “Ceci n’est pas une pipe,” which is French for “This is not a pipe.” There are many representations of inclusion in education. All of them warrant authenticity checks.

Knausgaard also refers to an artist to explain why he must write. The artist he chose is the Norwegian painter Edvard Munch. Munch paints, says Knausgaard (2018:5), because he has lost trust in the world. This may well be the predicament of inclusive education. The research domain exists because we cannot trust education jurisdictions to be inclusive.

This chapter focuses on a what is arguably the greatest challenge facing education systems around the world, that of finding ways of including all children in schools. In economically poorer countries this is mainly about the millions of children who are not able to attend formal education (UNESCO, 2015). Meanwhile, in wealthier countries many young people leave school with no worthwhile qualifications, while others are placed in special provision away from mainstream education and some choose to drop out since the lessons seem irrelevant (OECD, 2012). And, more recently, teachers have experienced unprecedented pressures in trying to find ways of ensuring quality education for all their students within the context of the COVID-19 pandemic. Faced with these challenges, there is evidence of an increased interest internationally in the idea of making education more inclusive and equitable. However, the field remains confused as to the actions needed in order to move policy and practice forward.

In the Chapter I draw on studies carried out over many years with colleagues in various parts of the world that point to some promising possibilities (for more detailed accounts of this research see: Ainscow, 2016a, 2020). In so doing, I provide a framework that has proved to be helpful in reviewing and developing national policies. I begin, however, by summarizing relevant international developments.

The international policy context

Over the last 30 years there have been major international efforts to encourage inclusive educational developments. In particular, the United Nation's Education for All (EFA) movement has worked to make quality basic education available to all learners. Agreed in 1990, the EFA Declaration sets out an overall vision, which is about being proactive in identifying the barriers some learners encounter in attempting to access educational opportunities (UNESCO, 1990). It also involves the identification of resources available at national and community level, and bringing them to bear on overcoming those barriers. This vision was reaffirmed by the World Education Forum meeting in Dakar (2000), held to review the progress made in the previous decade. The Forum declared that EFA must take particular account of the needs of the poor and the disadvantaged, including working children, remote rural dwellers and nomads, and ethnic and linguistic minorities, young people affected by conflict, HIV/AIDS, hunger and poor health, and those with special learning needs (UNESCO, 2000).

A major impetus for inclusive education was given by the World Conference on Special Needs Education in 1994. More than 300 participants representing 92 governments and 25 international organizations met in Salamanca, Spain to further the objective of Education for All by considering the fundamental policy shifts required to promote the approach of inclusive education, namely enabling schools to serve all children, particularly those defined as having special educational needs (UNESCO, 1994). Although the immediate focus of the Salamanca conference was on what was termed special needs education, its conclusion was that:

Special needs education – an issue of equal concern to countries of the North and of the South – cannot advance in isolation. It has to form part of an overall educational strategy and, indeed, of new social and economic policies. It calls for major reform of the ordinary school (pp. iii–iv).

The aim, then, is to reform education systems. This can only happen, it is argued, if mainstream schools become capable of educating all children in their local communities. In a much-quoted extract, the Salamanca Statement concluded that:

Regular schools with [an] inclusive orientation are the most effective means of combating discriminatory attitudes, creating welcoming communities, building an inclusive society and achieving education for all; moreover, they provide an effective education to the majority of children and improve the efficiency and ultimately the cost-effectiveness of the entire education system (p. ix).

As this key passage indicates, the move toward inclusive schools can be justified on a number of grounds. There is an *educational justification*: the requirement for inclusive schools to educate all children together means that they have to develop ways of teaching that respond to individual differences and that therefore benefit all children; a *social justification*: inclusive schools are able to change attitudes to difference by educating all children together, and form the basis for a just and non-discriminatory society; and an *economic justification*: it is likely to be less costly to establish and maintain schools which educate all children together than to set up a complex system of different types of school specializing in particular groups of children.

Further impetus to this movement was provided by the 48th session of the IBE-UNESCO International Conference on Education, with its theme “*Inclusive Education: The Way of the Future*,” held in 2008. The long-term objective of this event was to support UNESCO member states in providing the social and political conditions which every person needs in order to exercise their human right to access, take an active part in, and learn from educational opportunities (Operti et al., 2014). During the conference, ministers, government officials and representatives of voluntary organizations discussed the importance of broadening the concept of inclusion to reach all children, under the assumption that every learner matters equally and has the right to receive effective educational opportunities.

Moving forward, the year 2016 was particularly important in relation to the future of the EFA movement and, indeed, the legacy of Salamanca. Building on the Incheon Declaration agreed at the World Forum on Education in May 2015 (UNESCO, 2015), it saw the publication by UNESCO of the Education 2030 Framework for Action. This emphasizes inclusion and equity as laying the foundations for quality education. It also stresses the need to address all forms of exclusion and marginalization, disparities and inequalities in access, participation, and learning processes and outcomes. In this way, it is made clear that the international EFA agenda really has to be about “all.”

The importance of including disabled children is an essential strand within this new international policy agenda. This was stressed in the United Nations’ Convention on the Rights of Persons with Disabilities (United Nations, 2008), which states:

The right to inclusive education encompasses a transformation in culture, policy and practice in all educational environments to accommodate the differing requirements and identities of individual students, together with a commitment to remove the barriers that impede that possibility. (General Comment No 4).

The Convention defines non-inclusion, or segregation, as the education of students with disabilities in separate environments (i.e. in separate special schools, or in special education units located with regular schools). It commits to ending segregation within educational settings by ensuring inclusive classroom teaching in accessible learning environments with appropriate support. In essence, this means that education systems must provide a personalized educational response, rather than expecting the student to fit the system.

A new commitment reinforcing inclusion and equity in education was expressed at an International Forum, co-organized by UNESCO and the Ministry of Education of Colombia in September 2019 to celebrate the 25th anniversary of the Salamanca Declaration (UNESCO, 2019). As underlined by the theme “Every learner matters,” the Forum was an opportunity to revive the broadened notion of inclusion as a general guiding principle to strengthen equal access to quality learning opportunities for all learners.

Despite these developments, a recent Global Monitoring Report points out that an estimated 258 million children, adolescents and youth are still not in school (UNESCO, 2020). Furthermore, the UNESCO Institute for Statistics data show that more than 617 million children and adolescents are not achieving minimum proficiency levels in reading and mathematics (UIS, 2019). It is also important to note that only half of the world’s children receive pre-primary education, a failure that limits children’s futures and deepens inequities in later learning (UNICEF, 2019). Significantly, the disadvantaged are least served by quality early childhood care and education, although they benefit most from such interventions.

Meanwhile, there are high rates of student dropout globally, particularly at the secondary level, as well as challenges experienced by many marginalized groups during the transition to higher education (UNESCO, 2015). In developing countries, the low access to higher education of young people living in socioeconomically disadvantaged contexts and/or who are vulnerable for various reasons, is one of the most dramatic gaps in opportunities. This holds back the overall development of these nations.

In addition, it is vital to recognize that large gender gaps continue to exist in regards to access, learning achievement and continuation in education in many settings, most often at the expense of girls, although in some parts of the world boys are at a greater disadvantage. The evidence is that education systems often perpetuate rather than challenge gender inequalities (UNGEI, 2012).

While these concerns are most acute in the developing world, there are similar concerns in many wealthier countries, as noted by the OECD (2018), which reports that across its member countries, almost one of five students do not reach a basic minimum level of skills to function in today’s societies. It also states that students from low socio-economic background are twice as likely to be low performers, implying that personal or social circumstances are obstacles to achieving their educational potential.

Promising developments

Like all major policy changes, progress in relation to inclusion and equity requires an effective strategy for implementation. In particular, it requires new thinking that focuses attention on the *barriers* experienced by some children that lead them to become marginalized as a result of contextual factors, such as inappropriate curricula and forms of assessment, and inadequate teacher preparation and support. The implication is that overcoming such barriers is the most important means of development forms of education that are effective for all children. In this way, the focus on inclusion and equity becomes a way of achieving the overall improvement of education systems.

The situation across the world in relation to this challenging policy agenda is complex, with some countries making great strides, while others continue to have segregated provision of various forms of education for some groups of learners. There are, however, countries where there has been encouraging progress, such as:

- For more than 30 years, New Brunswick in Canada has pioneered the concept of inclusive education through legislation, local authority policies and professional guidelines (AuCoin et al., 2020). More recently, New Brunswick adopted a policy which defines the critical elements of an inclusive education system that supports students in common learning environments and provides supports for teachers. It sets clear requirements for school practice including procedures for the development of personalized learning plans, inclusive graduation, as well as strict guidelines when a variation of the common learning environment may be required.
- The Italian government passed a law in 1977 that closed all special schools, units and other non-inclusive forms of provision (Ianes et al., 2020). This legislation is still in force and more recent amendments have further strengthened the inclusive nature of the education system. Not only did this close segregated educational facilities but, starting with pre-schools, it removed the possibility of exclusion from school as a corrective sanction. While practice varies from place to place, there is no doubt that the principle of inclusion is widely accepted. There is, however, recent concern about an increase in students being withdrawn for periods outside the regular classroom for additional support.
- Having enacted legislation making disability discrimination within education unlawful, Portugal has gone much further in enacting an explicit legal framework for the inclusion of students with and without disabilities in education (Alves et al., 2020). Recent legislation requires that the provision of support for all students be determined, managed and provided at the regular school level, with local multidisciplinary teams responsible for determining what support is necessary to ensure all students (regardless of labels, categorization or a determination of disability) have access and the means to participate effectively in education, with a view to their full inclusion in society. It is also significant that Portugal has developed progressive assessment practices to support the achievement of all learners.
- In Finland, a country which regularly outperforms most other countries in terms of educational outcomes, education is viewed as a right and not as a privilege. The country's success is partly explained by the progress of the lowest performing quintile of students who out-perform those in other countries (Sabel et al., 2011). This has increasingly involved an emphasis on support for vulnerable students within mainstream schools, as opposed to in segregated provision. There is a particular focus on prevention of learning difficulties in Finland, and a high level of resources are directed at this in primary schools. For example, all Finnish schools are assigned specialists to support any student who requires additional help.

In drawing attention to these examples of policy development, it must be stressed that they are not seen as being perfect. Rather, they are countries where there are interesting developments from which to learn. They are also varied with respect to the approach being taken and what they have achieved. Consequently, while lessons can undoubtedly be learned from these developments, they must be replicated with care. There are many sources of inequity in education related to political, economic, social, cultural and institutional factors, and these vary across countries. This means that what works in one country may not work elsewhere. An emphasis on system change strategies being contextually sensitive is one of the pervading themes of the recommendations made later in this paper.

Other global trends

In some countries, increasing pressures to improve the rankings of education systems on global league tables is creating new barriers to progress in relation to inclusion and equity. This arises because of an increased emphasis on school autonomy, competition between schools and parental choice, and takes a variety of forms (Meyland-Smith and Evans, 2009). The schools involved have different titles, such as charter schools in the USA, free schools in Sweden, academies in England and independent public schools in parts of Australia. Implicit in these independent state-funded schools is an assumption that greater autonomy will allow space for the development of organizational arrangements, practices, and forms of management and leadership that will be more effective in promoting the learning of all students, particularly those from economically disadvantaged and minority backgrounds.

This global trend is a matter of considerable debate and there are varied views as to the extent to which it is leading to the desired outcomes. In particular, there is a concern that the development of education systems based on autonomy, coupled with high-stakes accountability and increased competition between schools, will further disadvantage learners from low-income and minority families (Salokangas and Ainscow, 2017). For example, parental choice and competition between schools has widened the gap between

schools that are seen to be more successful and those that are perceived to be less so in countries as varied as Chile, England and Sweden.

Recently New Zealand published a policy document based on the findings of a review of national policy carried out by an independent task force (Ministry of Education, 2019). This concludes that a key reason for the country's poor equity and achievement outcomes is that, since reforms introduced in 1989, schools have predominantly operated as autonomous, self-managing entities, loosely connected to each other and with a distant relationship with the center. This autonomy has left schools to operate largely on their own and without sufficient support. The document outlines the Government's strategy for the reform of the schooling system. This will involve a move toward a networked system that is more responsive to the needs of all learners, an approach I recommend later in this chapter.

In relation to these concerns, the OECD reports the success of certain education systems that rank highly on measures of both quality and equity (OECD, 2012). It argues:

The evidence is conclusive: equity in education pays off. The highest performing education systems across OECD countries are those that combine high quality and equity. In such education systems, the vast majority of students can attain high level skills and knowledge that depend on their ability and drive, more than on their socio-economic background (p. 14).

Further encouragement for this view is provided by the recent Report Card prepared for UNICEF by the Innocenti Center (UNICEF, 2018). The report focuses on educational inequalities in 41 of the world's richest countries, all of which are members of the Organization for Economic Co-operation and Development and/or the European Union. It argues that there is no systematic relationship between country income and indicators of equality in education. For example, it is notable that some of the economically poorer countries in the comparison, such as Latvia and Lithuania, achieve near-universal access to preschool learning and curb inequality in reading performance among both primary and secondary school students more successfully than countries that have far greater resources. The Report Card concludes that Finland, Latvia and Portugal have the most equal education systems.

The implication, then, is that it is possible for countries to develop education systems that are both excellent and equitable. The question is: how can this be achieved?

A whole-system approach

International experience has led me to formulate a framework for thinking about how to promote inclusion and equity within education systems (see Fig. 1). This forms the basis of UNESCO's *"Guide for Ensuring Inclusion and Equity in Education"* that I helped to develop with a team of international experts (UNESCO, 2017). Gradually amended through experience from an earlier version (Ainscow, 2005), the framework focuses attention on five interrelated factors, summarized in Fig. 1. These factors can help determine "levers for change" (Senge, 1989).

Senge (1989) sees "levers" as actions that can be taken in order to change the behavior of an organization and those individuals within it. He goes on to argue that those who wish to encourage change within an organization must be smart in determining where the high leverage lies. Too often, he suggests, approaches used to bring about large-scale changes in organizations are "low leverage." That is to say, they tend to change the way things look but not the way they work. Possible examples of low leverage activity in the education field include: the production of policy documents, conferences and in-service training courses. While such initiatives may

Fig. 1 A framework for promoting inclusion and equity within education systems.

make a contribution, by and large they do not lead to significant changes in thinking and practice. Our aim, therefore, must be to identify what may turn out to be more subtle, less obvious, higher leverage efforts to bring about change in education systems.

The framework places schools at the center of the analysis. This reinforces the point that moves toward inclusion must be focused on increasing the capacity of local neighborhood mainstream schools to support the participation and learning of an increasingly diverse range of learners. This is the paradigm shift implied by the Salamanca Statement, which I have described as an “inclusive turn” (Ainscow, 2007). It argues that moves toward inclusion are about the development of schools, rather simply involving attempts to integrate vulnerable groups of students into existing arrangements.

At the same time, the framework draws attention to a range of contextual influences that bear on the way schools carry out their work. These influences relate to: the principles that guide policy priorities within an education system; the views and actions of others within the local context, including members of the wider community that the schools serve and the staff of the departments that have responsibility for the administration of the school system; and the criteria that are used to evaluate the performance of schools. As explained below, these influences may provide support and encouragement to those in schools who are wishing to move in an inclusive direction. However, the same factors can act as obstacles to progress.

In what follows each of the five factors are explained, leading to a series of key ideas that need to be considered in developing future policies.

Inclusion and equity as principles

Terms such as “equity” and “inclusion” can be confusing since they may mean different things to different people. This is a particular problem when trying to move forward with other people – not least in schools, where everybody is so busy. Put simply, if there is not a shared understanding of the intended direction of travel, progress will be difficult. There is, therefore, a need for agreed definitions of these concepts.

In some countries, inclusive education is still thought of as an approach to serving children with disabilities within general education settings. Internationally, however, it is increasingly seen more broadly as a principle that supports and welcomes diversity among all learners. This presumes that the aim of is to eliminate social exclusion that is a consequence of attitudes and responses to diversity in race, social class, ethnicity, religion, gender and ability. As such, it starts from the belief that education is a basic human right and the foundation for a more just society. Hence, the emphasis on equity, which implies a concern with fairness. In the UNESCO Guide we sum this up as follows: “Every learner matters and matters equally” (UNESCO, 2017).

Our experience in many countries suggests that it is helpful to use a definition of inclusive education that involves the following elements:

Inclusion is a process. That is to say, inclusion has to be seen as a never-ending search to find better ways of responding to diversity. It is about learning how to live with difference, and, learning how to learn from difference. In this way differences come to be seen more positively as a stimulus for fostering learning, among children and adults.

Inclusion is concerned with the identification and removal of barriers. Here barriers may take different forms, some of which are to do with existing policies, the way schools are organized, relationships and the forms of teaching provided. Consequently, it is necessary to collect, collate and evaluate evidence about these factors in order to plan for improvements in policy and practice. This involves using evidence of various kinds to stimulate creativity and problem-solving.

Inclusion is about the presence, participation and achievement of all students. Here “presence” is concerned with where children are educated, and how reliably and punctually they attend; “participation” relates to the quality of their experiences while they are there and, therefore, must incorporate the views of the learners themselves; and “achievement” is about the outcomes of learning across the curriculum, not merely test or examination results.

Inclusion involves a particular emphasis on those groups of learners who may be at risk of marginalization, exclusion or under-achievement. This indicates the moral responsibility to ensure that those groups that are statistically most at risk are carefully monitored, and that, where necessary, steps are taken to ensure their presence, participation and achievement within the education system. At the same time, it is necessary to be vigilant in watching out for learners who may be overlooked.

We have found that a well-orchestrated debate about these elements can lead to a wider understanding of the principle of inclusion (Ainscow et al., 2006). Furthermore, such a debate, though by its nature slow and, possibly, never ending, can have leverage in respect to fostering the conditions within which schools can feel encouraged to move in a more inclusive direction. These debates must involve all stakeholders within communities, including families, political and religious leaders, and the media. They should also involve those within national and local district education offices. Recently, in countries such as Australia, Colombia, Mexico, Oman, Peru, Sweden and Uruguay, I have used the indicators provided by the UNESCO Guide for Ensuring Inclusion and Equity in Education to facilitate such discussions.

Use of evidence

In order to answer questions about inclusion and equity in education systems, it is important to know who is included, who is segregated and who is excluded from schooling. Without some form of statistical analysis in relation to these concerns, there

can be no accountability. However, when data collection efforts are only focused on particular categories of learner, there is a risk of promoting deficit views of those students who share certain characteristics, or come from similar backgrounds. This also distracts attention from more fundamental questions, such as: *Why are we failing some learners? What are the barriers experienced by some of our students?*

Previously I have argued that evidence is the life-blood of inclusive development (Ainscow, 2005, 2012). Therefore, deciding what kinds of evidence to collect and how to use it requires care, since, within education systems, “*what gets measured gets done.*” This is widely recognized as a double-edged sword precisely because it is such a potent lever for change. On the one hand, data are required in order to monitor the progress of children, evaluate the impact of interventions, review the effectiveness of policies and processes, plan new initiatives, and so on. On the other hand, if effectiveness is evaluated on the basis of narrow, even inappropriate, performance indicators, then the impact can be deeply damaging. While appearing to promote the causes of accountability and transparency, the use of data can, in practice: conceal more than they reveal; invite misinterpretation; and, worse of all, have a perverse effect on the behavior of professionals. The challenge is, therefore, to harness the potential of evidence as a lever for change, while avoiding these potential problems.

The starting point for making decisions about the evidence to collect at the system level should be with an agreed definition of inclusion. In other words, we must “measure what we value,” rather than is often the case, “valuing what we can measure.” In line with the suggestions made earlier, then, evidence collected within an education system needs to relate to the *presence, participation and achievement* of all students, with an emphasis placed on those groups of learners regarded to be “at risk of marginalization, exclusion or underachievement.”

This means that, in an education system based on the principles of inclusion and equity, all students should be assessed on an on-going basis in relation to their progress through the curriculum. This allows teachers to respond to a wide range of individual learners, bearing in mind that each learner is unique. It means that teachers and other professionals must be well informed about their students’ characteristics and attainments, while also assessing broader qualities, such as their capacity for cooperation. However, the ability to identify each student’s level of performance, or to enumerate certain student’s particular difficulties, is not enough. Teachers in inclusive systems need to gauge the effectiveness of their teaching for all of their students and should know what they need to do to enable each student to learn as well as possible.

An engagement with evidence is particularly crucial at the level of the school, where it can provide the stimulus for professional learning aimed at the development of inclusive thinking and practice. The starting point for developing inclusive practices is with the sharing of existing approaches through collaboration among staff, leading to experimentation with new practices that will reach out to all students (Ainscow, 2016b). This requires the development of a common language with which colleagues can talk to one another and, indeed, to themselves, about detailed aspects of their practice. Without such a language, teachers find it very difficult to experiment with new possibilities (Huberman, 1993).

A framework that can help in the promotion of an inclusive dialog within a school is provided by the *Index for Inclusion*, a review instrument developed originally for use in England but now available in many countries (Booth and Ainscow, 2002). It is intended to help draw on the knowledge and views of teachers, students, parents/carers and community representatives about barriers to participation that exist within the existing “*cultures, policies and practices*” of schools in order to identify priorities for change. In connecting inclusion with the detail of policy and practice, the Index encourages those who use it to build their own view of inclusion, related to their experience and values, as they work out which policies and practices they wish to promote or discourage.

The use of evidence to study teaching within a school can help in generating a language of practice (Ainscow et al., 2006). This, in turn, can foster the development of ways of working that are more effective in reaching hard to reach learners. Specifically, it can create space for rethinking by interrupting existing discourses. Particularly powerful techniques for generating evidence involve the use of mutual lesson observation, sometimes through video recordings, and comments collected from students about teaching and learning arrangements within a school (Ainscow and Messiou, 2017). Under certain conditions, such approaches provide *interruptions* that stimulate self-questioning, creativity and action. In so doing, they can lead to a reframing of perceived problems that, in turn, draws the teacher’s attention to overlooked possibilities for addressing barriers to participation and learning. In this way, differences among students, staff and schools become a catalyst for improvement.

Our recent research has explored teacher/student dialog as a means of making this happen. This was stimulated by a study carried out between 2011 and 2014 that had a major impact on our thinking (see Messiou et al., 2016, for more details). It involved collaborative action research carried out by teams of teachers in eight secondary schools in three countries (i.e. England, Portugal and Spain), with support from locally based university researchers.

Drawing on the lessons from this research, another study in primary schools trialled and evaluated a new model for developing learning and teaching that we call “Inclusive Inquiry” (Messiou and Ainscow, 2020). This uses dialog involving teachers and students in order to explore possibilities for making lessons more inclusive. Central to the model is the idea of engaging with the views of students, a process that permeates all the processes involved. The dialogs that this encourages are focused on learning and teaching. More specifically, differences among students and teachers are used to challenge existing thinking and practices in ways that are intended to encourage experimentation in order to foster more inclusive ways of working. This, in turn, sets out to break down barriers that are limiting the engagement of some learners.

The evidence from this study supports our earlier research which suggested that classroom-based research carried out by practitioners can be a powerful way of moving practice forward within a school. What is distinctive, however, is the added value that comes from engaging students themselves in the process. It is also clear that the use of the approach can present various

organizational challenges. In particular, it has sometimes proved to be challenging of the status quo within schools. Consequently, greater collaboration is needed among teachers in order to support the introduction of new practices. This requires organizational flexibility and the active support of senior staff, prepared to encourage and support processes of experimentation. Indeed, it implies the need for cultural change within a school, a theme I return to in the next section.

School development

There is not one single model of what an inclusive school looks like. What is common to highly inclusive schools, however, is that they are welcoming and supportive places for all of their students, not least for those with disabilities and others who experience difficulties (Dyson et al., 2004). This does not prevent these schools from also being committed to improving the achievements of all of their students. Indeed, they tend to have a range of strategies for strengthening achievement that are typical of those employed by all effective schools, and the emphasis on supporting vulnerable students does not appear to inhibit these strategies. As noted above, a key factor is the emphasis placed on tracking and supporting the progress of all of the students.

A problem reported from a number of countries, is that despite national policies emphasizing the equal rights of all children to attend mainstream settings, there has been evidence over many years of significant increases in the proportions of students being categorized in order that their schools can earn additional resources (Fulcher, 1989; Meijer and Watkins, 2019). This has led to dissatisfaction with progress toward integration and brought demands for more radical changes. One of the concerns of those who adopt this view is with the way in which students come to be designated as having special needs (e.g. Slee, 2010). They see this as a social process that needs to be continually challenged. More specifically, they argue that the continued use of what is sometimes referred to as a “medical model” of assessment – within which educational difficulties are explained solely in terms of a child’s deficits – prevents progress in the field, not least because it distracts attention from questions about why schools fail to teach so many children successfully.

The orientation I am adopting has been defined as a “social model.” Rather than focusing on the characteristics of learners, this involves an assessment of contextual barriers facing some learners and an identification of resources, particularly human resources, that can be mobilized in order to overcome these difficulties. The implication is that efforts to promote inclusion and equity should be seen as what my colleagues and I referred to as “school improvement with attitude” (Ainscow et al., 2006).

This means that the focus is on the reform of policies and practices in ways that will lead them to respond positively to student diversity – seeing individual differences not as problems to be fixed, but as opportunities for enriching learning. Within such a conceptualization, a consideration of difficulties experienced by students can provide an agenda for change and insights as to how such changes might be brought about. However, this kind of approach is more likely to be successful in contexts where there is a culture of collaboration that encourages and supports problem-solving (Ainscow, 2016; Skrtic, 1991).

These themes are further supported by a review of international research literature that examines the effectiveness of school actions in promoting inclusion (Dyson et al., 2004). In summary, this suggests that some schools are characterized by an “inclusive culture.” Within such schools, there is a degree of consensus among adults around values of respect for difference and a commitment to offering all students access to learning opportunities.

The extent to which such inclusive cultures lead directly and unproblematically to enhanced student participation is not clear. Some aspects of these cultures, however, can be seen as participatory by definition. For instance, respect for diversity from teachers may itself be understood as a form of participation by children within a school community. Moreover, schools with such cultures are also likely to be characterized by forms of organization (such as specialist support being made within the ordinary classroom, rather than by withdrawal for separate attention) and practices (such as cooperative group work) which could be regarded as participatory by definition.

All of this means that attempts to develop inclusive schools should pay attention to the building of consensus around inclusive values within school communities. This implies that school leaders should be selected in the light of their commitment to inclusive values and their capacity to lead in a participatory manner (Riehl, 2000). Finally, the external policy environment should be compatible with inclusive developments in order to support rather than undermine the efforts of schools.

Involving the wider community

In order to foster inclusion and equity in education, governments need to mobilize human and financial resources, some of which may not be under their direct control. Forming partnerships among key stakeholders who can support and own the process of change is therefore essential. These stakeholders include: parents/caregivers; teachers and other education professionals; teacher trainers and researchers; national, local and school-level administrators and managers; policy-makers and service providers in other sectors (e.g., health, child protection and social services); civic groups in the community; and members of minority groups that are at risk of exclusion.

Family involvement is particularly crucial. In some countries, parents and education authorities already cooperate closely in developing community-based programmes for certain groups of learners, such as those who are excluded because of their gender, social status or impairments (Miles, 2002). A logical next step is for these parents to become involved in supporting change for developing inclusion in schools.

Where parents lack the confidence and skills to participate in such developments, it might be necessary to engage and build capacity and networks. This could include the creation of parent support groups, training parents to work with their children, or building the advocacy skills of parents to negotiate with schools and authorities. Here, it is worth adding that we have evidence that the views of families, including children themselves, can be helpful in bringing new thinking to the efforts of schools to develop more inclusive ways of working (Calderón-Almendros et al., 2020).

All of this means changing how families and communities work, and enriching what they offer to children. In this respect there are many encouraging examples of what can happen when what schools do is aligned in a coherent strategy with the efforts of other local players – employers, community groups, universities and public services (Kerr et al., 2014). This does not necessarily mean schools doing more, but it does imply partnerships beyond the school, where partners multiply the impacts of each other's efforts.

This has implications for the various key stakeholders within education systems. In particular, teachers, especially those in senior positions, have to see themselves as having a wider responsibility for all children, not just those that attend their own schools. They also have to develop patterns of internal organization that enable them to have the flexibility to cooperate with other schools and with stakeholders beyond the school gate.

This approach draws on the principles underpinning the highly acclaimed Harlem Children's Zone in the USA (Whitehurst and Croft, 2010). These involve efforts to improve outcomes for children and young people in areas of disadvantage through an approach that they characterize as being "doubly holistic". That is to say, they seek to develop coordinated efforts to tackle the factors that disadvantage children and enhance the factors which support them, across all aspects of their lives, and across their life spans, from conception through to adulthood. Dobbie and Fryer (2009) describe the Children's Zone as "arguably the most ambitious social experiment to alleviate poverty of our time" (p. 1).

Another American initiative, Strive Together, acts as a central backbone organization for sites using similar ideas across the country that are locally tailored (Grossman, Lombard, and Fisher, 2014). These initiatives are guided by indicators that span young people's lives "from cradle to career," with progress determined using data at all stages.

The role of administrative departments

Policy is made at all levels of an education system, not least at the school and classroom levels (Ball, 2010). As such, the promotion of equity and inclusion is not simply a technical or organizational change – it is a movement in a clear philosophical direction. Moving to more inclusive ways of working therefore requires changes across an education system. These span from shifts in policy-makers' values and ways of thinking, which enable them to provide a vision shaping a culture of inclusion, to significant changes within schools and classrooms.

A culture of inclusion in education requires a shared set of assumptions and beliefs among policy-makers and senior staff at the national, district and school level that value differences, believe in collaboration, and are committed to offering educational opportunities to all students. However, we have found that changing the cultural norms that exist within an education system is difficult to achieve, particularly within a context that is faced with so many competing pressures and where practitioners tend to work alone in addressing the problems they face (Ainscow et al., 2020). Leaders at all levels, including those in civil society and other sectors, therefore have to be prepared to analyze their own situations, identify local barriers and facilitators, plan an appropriate development process, and provide leadership for inclusive practices and effective strategies for monitoring equity in education.

National and district administrators have important roles in promoting inclusive ways of managing schools and education processes. In particular, they have to establish the conditions for challenging discriminatory educational practices. They also need to establish the conditions that build consensus and commitment toward putting the universal values of inclusion and equity into practice. Certain forms of leadership are known to be effective in promoting inclusion in education (Riehl, 2000). These approaches focus attention on teaching and learning; they create strong supportive communities of students, teachers and parents; they nurture the understanding of a culture of education among families; and, they multi-agency support.

There is also evidence that school-to-school collaboration can strengthen the capacity of individual organizations to respond to learner diversity (Muijs et al., 2011). Specifically, collaboration between schools can help to reduce the polarization of schools, to the particular benefit of those students who are marginalized at the edges of the system. In addition, there is evidence that when schools seek to develop more collaborative ways of working, this can have an impact on how teachers perceive themselves and their work. Specifically, comparisons of practices in different schools can lead teachers to view underachieving students in a new light. In this way, learners who cannot easily be educated within the school's established routines are not seen as "having problems," but as challenging teachers to re-examine their practices in order to make them more responsive and flexible.

Certain conditions are necessary in order to make school-to-school collaboration effective (Chapman and Ainscow, 2021). In summary, these are as follows:

- The development of positive relationships among groups of schools, in some instances across the borders of local authorities;
- The presence of incentives that encourage key stake holders to explore the possibility that collaboration will be in their own interests;
- Senior staff in schools who are willing and skilled enough to drive collaboration forward toward collective responsibility, while coping with the inevitable uncertainties and turbulence;
- The creation of common improvement agendas that are seen to be relevant to a wide range of stakeholders; and

- Coherent external support provided by credible consultants/advisers (from the local authority or elsewhere) who have the confidence to learn alongside their school-based partners, exploring and developing new roles and relationships where necessary.

Local coordination is needed in order to encourage such forms of collaboration (Armstrong and Ainscow, 2018). Indeed, a recent report noted that four of the most successful national education systems - Singapore, Estonia, Finland, and Ontario – each has a coherent “middle tier,” regardless of their differing extents of school autonomy or devolution of decision-making (Bubb et al., 2019). In particular, they all had district level structures that offer a consistent view that, to maintain equity as well as excellence, there needs to be an authoritative co-ordinating influence with local accountability.

Having analyzed two relatively successful large-scale improvement initiatives, Andy Hargreaves and I have suggested a way of supporting local authorities in responding to these new demands (Hargreaves and Ainscow, 2015). We argue that, in taking on new roles, districts can provide a valuable focus for school improvement, be a means for efficient and effective use of research evidence and data analysis across schools, support schools in responding coherently to multiple external reform demands, and be champions for families and students, making sure everybody gets a fair deal.

The problem is, of course, that not all local school systems are strong. Therefore, a way to reduce variation among school districts is to promote collaboration among them so they share resources, ideas, and expertise, and exercise collective responsibility for student success. In adopting this “leading from the middle” approach, districts can become the collective drivers of change and improvement together.

Finally, there are implications here for national accountability and inspection systems. In particular, the research on the benefits of school-to-school cooperation suggests that it is now time for school evaluation to be carried out *by schools for schools*, in ways that can act as a stimulus for improvement. This echoes the recommendations of Fullan et al. (2015) who argue for a move away from a heavy reliance on external accountability toward an investment in the professional capital of teachers and school leaders. However, this has to be challenging and credible. In other words, it must not involve forms of collusion within which partner schools endorse one another in an acceptance of mediocrity. Here, again, evidence is an essential ingredient.

Conclusion

In summary, then, the ideas that have emerged from this review of international experiences, research and policy documents regarding ways of promoting equity and inclusion are as follows:

- Policies should be based on clear and widely understood definitions of what the terms inclusion and equity mean;
- Strategies should be informed by evidence regarding the impact of current practices on the presence, participation and achievement of all students;
- There should be an emphasis on whole-school approaches in which teachers are supported in developing inclusive practices;
- Policies should draw on the experience and expertise of everybody who has an involvement in the lives of students, including the children themselves; and
- Education departments must provide leadership in the promotion of inclusion and equity as principles that guide the work of teachers in all schools

Building on these key ideas, I recommend that those wishing to promote inclusion and equity within their national education system should focus on the following agenda for reform:

In terms of principles

- Are there agreed definitions of inclusion and equity in education?
- If so, are these definitions widely known and understood across the education system?

In terms of use of evidence

- Are systems in place to monitor the presence, participation and achievement of all school students?
- Is there awareness of which students are left behind or left out?
- Do schools use evidence to stimulate efforts to include all students?

In terms of school development

- Are teachers encouraged to develop practices that are intended to include all students?
- Do schools have effective professional development programmes related to inclusive practices?
- Do school leaders emphasize the importance of inclusive education?

In terms of community involvement

- To what extent are families seen as partners in supporting their children’s education?
- Do schools collaborate with other professionals, such as those involved in the health and social services?
- Do schools link with the efforts of other local players, e.g. employers, community groups, universities and public services?

In terms of the roles of education departments

- To what extent do national policy-makers encourage the development of inclusive practices?
- Do local district administrators take actions to promote inclusion and equity?

This reform agenda indicates that the promotion of inclusion and equity in education is less about the introduction of particular techniques or new organizational arrangements, and much more about processes of social learning within particular contexts. As I have argued, the use of evidence as a means of stimulating experimentation and collaboration is seen as a central strategy. As Copland (2003) suggests, inquiry can be the “engine” to enable the distribution of leadership that is needed in order to foster participation in learning, and the “glue” that can bind a community together around a common purpose.

All of this has major implications for leadership practice within schools and education systems. In particular, it calls for efforts to encourage coordinated and sustained efforts around the idea that changing outcomes for vulnerable groups of students is unlikely to be achieved unless there are changes in the thinking of adults. Consequently, the starting point must be with policy-makers and practitioners: in effect, enlarging their capacity to imagine what might be achieved, and increasing their sense of accountability for bringing this about. This may also involve tackling taken-for-granted assumptions, most often relating to expectations about certain groups of students, their capabilities and behaviors.

Introduction

The impact of the global pandemic has been far reaching. It has affected almost all aspects of our lives. It has disrupted schooling and the workforce more broadly, upending education and the psychological, physical, social, emotional and cognitive development, and wellbeing of many. While it has interrupted education and employment, it has also resulted in lost lives and livelihoods, isolation and separation from family and loved ones, and created a time of uncertainty and fear. What the pandemic has achieved is a simultaneous sense of togetherness and separation.

Despite the insecurity and trepidation the pandemic has brought about, such a significant global event has provided opportunity for alternative perspectives on how we approach and engage with education. The pandemic has afforded a unique time to re-examine and re-imagine more equitable societies and education systems (Arnone, 2020), particularly given that the consequences of the pandemic have impacted the most vulnerable the hardest (Schleicher, 2020). It is through both subtle and overt forms of educational and social exclusion that we are forced to consider more inclusive ways of thinking, knowing and doing.

The global pandemic is arguably the greatest challenge that education systems have ever experienced (Daniel, 2020). As Ainscow (1995, pp. 11–12) wrote some 25 years preceding the pandemic, “traditional school cultures, supported by fixed organizational arrangements and high levels of specialisms among staff who are geared to predetermined tasks, are in trouble when faced with unexpected circumstances.” It was precisely these unexpected circumstances that challenged traditional understandings of “traditional” school cultures and organizational arrangements. Put simply, most educational systems were ill-equipped and unprepared for a rapid shift in education from face-to-face delivery to online teaching and learning arrangements. It also signaled that schools provided far more than education; they provided a place of safety, social connectedness, connections to interagency supports, meals and access to learning resources (Stanistreet et al., 2020). For many learners, access to these basic provisions ceased during months of government-imposed lockdowns in an effort to control the spread of the virus. An estimated 90% of the global student population were directly affected by school closures due to the pandemic (Global Education Monitoring Report, 2020).

This chapter aims to re-examine the Education for All [EFA] agenda in what has been termed “apocalyptic” times: apocalyptic to capture the momentous and seemingly catastrophic times we find ourselves in. One in which there seems to be no end and few affordances for escape. While the global pandemic served to create barriers, exclusion and distance, it simultaneously served to bring unity and often unexpected change. These changes have permeated what appear to be all aspects of society and shifted how we conceptualize and enact education at local, national and global levels.

Educational inclusion

Inclusion cannot be considered independent of exclusion. In so doing, this chapter considers how the global pandemic has influenced how we understand inclusion and exclusion, from educational and societal perspectives, and the subsequent challenges and opportunities such an event created. In order to do so, there is a necessity to clarify and distinguish between key terms often misunderstood or used interchangeably within the field of inclusive education: equity, equality and inclusion.

Central to discussion regarding inclusion is the need to differentiate between equity and equality, both in terms of policy and practice. While each centers on fairness, they have vastly different meanings. In essence, to distinguish between the terms is to equate equity to fairness and equality to sameness. That is, equity means that every learner is afforded the kinds of opportunities they require, reflective of their specific circumstance. Equality, however, means that all students receive the same resources and opportunities, almost irrespective of their specific circumstance. Inclusion, however, is comparatively more difficult to define. Bearing similarity to equity, inclusion may be considered as “a process: actions and practices that embrace diversity and build a sense of belonging, rooted in the belief that every person has value and potential and should be respected” (Global Education Monitoring Report, 2020, p. 11).

Given the common blurring between these related terms, it is perhaps not surprising therefore that the field of inclusive education “remains confused about the actions that need to be taken to move policy and practice forward” (Ainscow and Miles, 2008, p. 16). While some countries situate inclusive education as an approach to serving children with disability within general or mainstream education settings, there is a shift toward conceptualizing inclusive education as a reform that supports and embraces the diversity of all learners. Within this notion is the premise that “education is a basic human right and the foundation of a more just society” (Ainscow and Miles, 2008, p. 16). And yet, less than 10% of countries have laws that aim to support full inclusion in education (Global Education Monitoring Report, 2020) and of the 68% of countries that have defined inclusive education, just 57% of definitions include multiple marginalized groups (Global Education Monitoring Report, 2020). When we consider an “education for all,” it seems apparent that there are many marginalized groups that appear to fall outside the understanding of “all.” Through stigmatizing, stereotyping and discrimination, millions of children and young people are alienated and excluded within classrooms and school settings (Global Education Monitoring Report, 2020).

As acknowledged elsewhere in this chapter, education is a far broader concept than the acquisition of skills and knowledge. If we continue to consider what inclusive education entails, we must appreciate that it aims to “promote democratic principles and a set of values and beliefs relating to equality and social justice so that all children can participate in teaching and learning” (Miles and Singal, 2010, p. 11). As Ainscow et al. (2019, pp. 675–676) have argued, the implication of many inclusive education policies and agendas is that “moving in an inclusive direction continues to involve struggles to find the most appropriate ways of moving forward ... the promotion of inclusion is not simply a technical or organizational change—it is a movement in a clear philosophical direction.” In critically examining the underpinnings of inclusive education, we are therefore afforded:

an opportunity for society to examine critically its social institutions and structures. It necessarily challenges didactic, teacher-centred teaching practices, such as rote learning, and so opens up opportunities for developing better pedagogy and greater competence. [Education For All] often fails to explore such broad issues.

Miles and Singal (2010, p. 12).

Therefore, and as Miles and Singal (2010, p. 12) have reasoned, “radical changes are required in education systems, and in the values and principles of the people involved in delivering education, if the world’s most vulnerable and disadvantaged children are to gain access to their local school.” In essence, inclusive education can be considered as both a philosophy and a practice which is underpinned through local, national and global policy ideals.

Toward an inclusive education for all

A commitment to in-school inclusion deviates from an historical tendency to exclude learners with disability from education or to segregate learners to specialized settings. Such a commitment clearly distinguishes inclusion from integration and can be seen in global policies that have made an intentional shift toward an inclusive education for all, acknowledging education as a basic human right.

While education was recognized as a human right in 1948, the call for inclusion came some time later. However, calls for inclusion are not new, with international declarations regarding the commitment to non-discrimination made since 1960 and to inclusion since 1990 (Global Education Monitoring Report, 2020). The 1994 Salamanca World Conference on Special Needs Education endorsed the notion of inclusive education (UNESCO, 1994), with the aim of furthering the Education for All objective by considering the fundamental policy shifts required to promote inclusion (Ainscow et al., 2019). As a result, the *Salamanca Statement and Framework for Action on Special Needs Education* is arguably the most significant international document to appear in the field of special education. It argues that regular or mainstream schools that have an inclusive orientation are “the most effective means of combating discriminatory attitudes, creating welcoming communities, building an inclusive society and achieving education for all” (United Nations Educational Scientific and Cultural Organization (UNESCO), 1994, p. 10).

The 2006 UN Convention on the Rights of Persons with Disabilities (CRPD) likewise advocated for the right to inclusive education. The General Comment No. 4 to CRPD Article 24 positioned inclusive education as “a process ... to provide all students ... with an equitable and participatory learning experience and environment that best corresponds to their requirements and preferences.” Such understanding is echoed within related global policies, including Education for All and the United Nations 2030 Agenda for Sustainable Development, with its fourth Sustainable Development Goal (SDG 4) committing to “ensur[ing] inclusive and equitable quality education and promote lifelong learning opportunities for all” (United Nations, 2020, p. 32).

However, exclusion persists. And perhaps, it is no timelier, than in the midst of a global pandemic, for this to be illustrated so starkly. In monitoring the progress of education targets adopted by UN Member States in the 2030 Agenda for Sustainable Development across 209 countries, 258 million children and young people were entirely excluded from education (Global Education Monitoring Report, 2020). For those who remained connected to education, there was a considerable population whom were inadequately supported. As Global Education Monitoring Report (2020) data has illustrated, 40% of the world’s poorest countries failed to provide adequate support to learners at risk during the pandemic, thereby further marginalizing some of the most vulnerable children and young people. Those who were most at risk of exclusion, exacerbated during the pandemic, included students living

remotely, in poverty, from linguistic and cultural minorities and learners with disability. In consideration of an “education for all,” how this was understood and transposed to “apocalyptic” times remained problematic.

The education for all agenda

The Education for All agenda emerged from the 1990 World Conference on Education for All, held in Jomtien, Thailand. Promoting the event through the slogan, “EFA by the year 2000”, the event brought together 155 countries to commit to achieving an education for all. Key to this commitment was a pledge to provide primary education “for all” by the year 2000 and to “ensure that children and adults would benefit from educational opportunities designed to meet their basic learning needs” (Bloom and Cohen, 2002, p. 86). The conference was particularly significant for two key reasons: firstly, it acknowledged the considerable population of vulnerable and marginalized groups of learners excluded from education systems worldwide and secondly, it outlined a vision of education as being far broader than just schooling.

Underpinning the Education for All agenda was an international commitment to ensuring that all children and adults receive a good quality education. In exploring the Agenda, there is a need to understand the justification behind such a movement. The provision of an “Education for All” has been reasoned on four grounds: humanitarian, sociological, political, and economic (Bloom and Cohen, 2002). As Bloom and Cohen (2002, pp. 87–88) describe, they are:

- humanitarian: education enables human beings to develop their capacities so that they can lead fulfilling and dignified lives;
- sociological: social and cultural capital, which are crucial ingredients in the development process and ones that enhance the operation of other development channels, can be greatly strengthened by education;
- political: education is popular among voters; and
- economic: education, or investment in people’s capacities, raises people’s productivity and provides a foundation for rapid technological change.

Building on these justifications, the Education for All agenda has presented a powerful force in positioning education as a rights issue, acknowledging that education is central to developing economies, fostering the disability movement, and presenting a stronger realization that education is essential for “global tolerance” (Miles and Singal, 2010, p. 11).

Despite the direction of the Jomtien Declaration, the call to hold the Salamanca World Conference on Special Needs Education only four years following appeared to imply that the phrase “education for all” may have really meant “almost all,” continuing the historical assumption that “a small percentage of children have to be seen as ‘outsiders’, whose education must be catered for by a separate, parallel system, usually known as special education” (Ainscow and Miles, 2008, p. 16).

Progress in meeting the goals underpinning the Education for All agenda were reviewed 10 years following the 1990 World Conference on Education for All, at the World Education Forum in Dakar, Senegal. The event was attended by 1100 participants representing 164 countries. By that time, considerable advances had been made, with some countries nearing the target of achieving universal primary education. As such, six key education goals, designed to meet the learning needs of all children, young people and adults by 2015, were identified. They included:

- Goal 1: Expand early childhood care and education
- Goal 2: Provide free and compulsory primary education for all
- Goal 3: Promote learning and life skills for young people and adults
- Goal 4: Increase adult literacy by 50%
- Goal 5: Achieve gender parity by 2005, gender equality by 2015
- Goal 6: Improve the quality of education (United Nations, 2000)

Such commitment to Education for All was reinforced through the eight Millennium Development Goals (The World Bank, 2020). The goals were visioned to contribute toward building a better world in the 21st century, with the aim to:

- Goal 1: Eradicate extreme poverty and hunger
- Goal 2: Achieve universal primary education
- Goal 3: Promote gender equality and empower women
- Goal 4: Reduce child mortality
- Goal 5: Improve maternal health
- Goal 6: Combat HIV/AIDS, malaria, and other diseases
- Goal 7: Ensure environmental sustainability
- Goal 8: Develop a global partnership for development (The World Bank, 2020)

Evident within the Millennium Development Goals was a commitment to eradicate extreme poverty and hunger and to achieve universal primary education (The World Bank, 2020). Inherent within the Goals was a pledge to intercept the cycle of exclusion from education which often contributes to poverty and broader social exclusion. However, concern enveloped the EFA agenda in that there appeared to be a narrowing to the second Millennium Development Goal, noting that an “education for all” had funneled toward a narrow focus on five years of compulsory schooling, from ages 6 to 11 years, inferring the view that 5 years of primary schooling will suffice (Miles and Singal, 2010). Such inference is therefore problematic to truly realizing an education

for all. We therefore need to problematize the relationship between the Education for All agenda and inclusive education. As Ainscow and Miles (2008, p. 20) have argued:

progress in relation to both the EFA agenda and inclusive education requires greater clarity about what becoming more inclusive involves. For us, it is a principled approach to education, which involves:

- The process of increasing the participation of students in, and reducing their exclusion from, the curricula, cultures and communities of local schools;
- Restructuring the cultures, policies and practices in schools so that they respond to the diversity of students in their locality; [and]
- The presence, participation and achievement of all students vulnerable to exclusionary pressures, not only those with impairments or those who are categorized as “having special educational needs.”

In considering Education for All and inclusive education as separate entities, we create “an unhelpful and wasteful polarization between EFA and inclusive education” (Miles and Singal, 2010, p. 1) in that inclusive education is often perceived in terms of overcoming barriers to learning for all children and young people, thereby “filling” the gap of EFA. Contributing to this, in the context of Southern countries, inclusive education tends to focus on students with disability. The challenge, therefore, for educators and educational systems, is to reconceptualize the relationship between the Education for All agenda and inclusive education through increasing collaboration and synergy between these interrelated agendas (Miles and Singal, 2010). Where the Education for All agenda and inclusive education converge however, is in the commitment to providing quality education for all children and young people.

In conceptualizing inclusive education in this way, it captures several key philosophical underpinnings. That is, inclusion:

- involves all learners in educational contexts;
- is centered on presence, participation and achievement;
- and exclusion are related, in so far that inclusion actively aims to respond to exclusion; and
- is an ever-revolving process. That is, a truly inclusive school is fluid (Ainscow and Miles, 2008) and responsive to given changes.

To advocate for inclusive education is to actively shift away from explanations of educational failure that focus on individual deficit to critically examining the barriers to education that are created by educational policies, practices and systems (Best, 2016). Therefore, in building on the legacy of the *Salamanca Statement and Framework for Action on Special Needs Education*, in order to progress an inclusive education, we must focus on developing inclusive education systems (Ainscow et al., 2019). In moving a commitment to an education for all forward in “apocalyptic” times, attention must shift to addressing the cultural and contextual fitness of educational programs which specifically focus on addressing educational and social inequity (Miles and Singal, 2010).

As this chapter has highlighted, the field of inclusive education is entrenched with “uncertainties, disputes and contradictions” (Ainscow and Miles, 2008, p. 20). Notwithstanding this, attempts have been made to respond to the educational needs for learners in more inclusive and equitable ways. The challenge now is to continue these movements in light of the dynamic challenges that a global pandemic has presented.

A sudden shift for teaching and learning in “apocalyptic” times

The pandemic has served to both highlight and deepen inequality and expose the seeming fragility of societies worldwide. In exposing such inequality and fragility, there is a “collective responsibility” (Global Education Monitoring Report, 2020, p. iii) to support those who are most vulnerable and disadvantaged. While the pandemic has much to account for, many of these inequities were apparent prior to COVID-19, with one in five children, adolescents and young people excluded from education in entirety (Global Education Monitoring Report, 2020). This worldwide circumstance has served to amplify the situation.

It is almost unquestionable that all learners have been affected, in one way or another, by school closures during the pandemic. While it is anticipated that learners have experienced a short-term direct loss of learning, there remains concern regarding longer lasting effects that may be indirectly caused by impending recessions that will steer millions of people closer to the poverty line (Global Education Monitoring Report, 2020). The need to address this in order to strive for an education for all is therefore commanding.

Government-imposed lockdowns due to the pandemic derailed economic activity and severely threatened the livelihoods of billions of people globally. Perhaps most impactful for education, and indeed, for teachers, students and caregivers, was the closure of schools and universities which lasted for at least 10 weeks in most OECD and partner countries (Schleicher, 2020). At the apparent peak of the closure period, occurring in April 2020, 91% of the global student population was affected in 194 countries (Global Education Monitoring Report, 2020). By the end of May 2020, national school closures remained in effect in 150 countries, affecting 68% of the global education population (Global Education Monitoring Report, 2020). Because of these

government-imposed lockdowns, educational policy makers and practitioners were confronted with tough decisions. What was evident was a distinct need to deliver education in non-traditional ways, including through technologically-mediated platforms.

Perhaps nowhere are the inequities emanating from the pandemic highlighted more patently than in education systems. As [Armove \(2020, p. 43\)](#) notes, “the individuals most marginalized and discriminated against have suffered the greatest from the closure of schools and the efforts to reach students with online instruction.” When we consider what an education for all in apocalyptic times means, we need to understand that education necessitated a difference in terms of delivery. For some students, this process was one premised on inclusion, while for others, it exacerbated exclusion. For example, 64% of some of the poorest, low-income countries used radio for primary education, as compared to 42% for upper-middle-income countries ([Global Education Monitoring Report, 2020](#)). Further, 74% of lower-middle-income countries relied on television to support the delivery of primary education, compared to 36% of low-income countries. However, when we consider how online platforms facilitated the delivery of learning experiences, they were used in approximately 55% of low-income, 73% of lower-middle-income and 93% of upper-middle-income countries ([Global Education Monitoring Report, 2020](#)).

The interruption caused by a quick shift to online learning was untested and unprecedented. It created disruption to many families around the world. While it inevitably impacted caregivers’ productivity, it likewise impacted learners’ social lives and learning ([Burgess and Sievertsen, 2020](#)).

Such a rapid transition was complex and comprised an intricate mix of urgency, readiness to engage with digital platforms, online teaching tools, digital and technological fluency, while compounded by a need to respond to emotions of fear and the distancing created through social isolation ([Agnoletto and Queiroz, 2020](#)).

Such a sudden and somewhat unexpected closure of schools and shift to online learning served to further marginalize and discriminate against some of the most vulnerable learners ([Armove, 2020](#)). In consideration of an education for all, such a radical shift created barriers for some students accessing education. That is, education suddenly became technologically-mediated and those who did not have access to a computer, the internet, or lived in remote areas with unreliable or unavailable electricity sources were excluded from accessing basic education ([Armove, 2020](#)). For those students who did have a computer and internet at home, many were competing with parents and caregivers for access, due to the swift deployment of work-from-home requirements. So, while some students required technology in order to access education, parents and caregivers required the same technology to undertake paid employment duties. This likewise extended to teachers, many of whom were juggling the home schooling of their own children while simultaneously teaching their own classes remotely. While educators can facilitate online learning from afar, it is often caregivers that are left to field questions and clarify content for learners in their care. For many learners, this meant relying on caregivers who had little or no education. This issue, albeit complex, seems to have been relatively unacknowledged by educational systems in their commitment to an education for all in apocalyptic times.

Enacting effective reform requires moving beyond just reimagining a new vision for education. As [Bloom and Cohen \(2002\)](#) claim, effective reform requires the appreciation of the different goals of education in different cultures, as well as developing the human and technological capacity requisite to meeting those goals. In many ways, the pandemic has signaled the opportunities that digital technologies can provide in enabling access and to and engagement with education ([Best and MacGregor, 2017](#); [Schleicher, 2020](#)). That is, it provides alternative ways of approaching what is learned, how learning occurs, and where and when. Employing digital technologies in an attempt to increase innovation and access enables a shift for the role of educators as knowledge leaders to working alongside students as co-creators, coaches, mentors, and evaluators ([Schleicher, 2020](#)).

Despite a diversity of circumstances that have placed students at risk of educational underachievement and attrition, the social and digital divides created by the pandemic have served to marginalize many of these students further. Global efforts to maintain continuity with learning further exacerbated exclusion. Although education systems pivoted to the online delivery of learning, most of these were considered inferior substitutes to face-to-face classroom instruction. Learners who required more specialized support or assistance were particularly disadvantaged through the delivery of online learning experiences. However, despite increasing reliance and accessibility on technology to mediate learning, there remains a distinct digital divide that illuminates the limitations of such an approach. That is, there are assumptions inherent with online learning: students and educators require access to adequate internet connection, technological equipment, and the skills and conditions to access, engage and utilize such platforms.

The shift to online learning was sudden, with educators, school administrators and educational systems needing to shift—almost overnight—to new tools to design, deliver and distribute learning and associated content and to communicate with students and their caregivers. Traditional approaches to face-to-face learning have required synchronous learning to typically occur in classroom settings. However, in shifting to remote forms of learning, schools and educators have been challenged to adapt to asynchronous approaches to teaching and learning. Asynchronous learning provides educators with increased flexibility in preparing learning materials, while enabling students time to navigate the demands of home and study ([Daniel, 2020](#)). This affords educators increased flexibility in relation to the timing of delivering materials (for example, through asynchronous methods such as wikis, blogs and email) and in the monitoring of students and their respective progress.

However, despite this, perhaps most concerning about considering an education for all in “apocalyptic” times are the implications for learners with disability and those in the early years of school. Research consistently evidences that learners with disability are at an increased risk of school suspension and exclusion ([Graham et al., 2020](#)). While many educators were able to adapt to online teaching and learning with minimal notice, for those who worked with students who had physical impairment, this was a different case. That is, while the technology and resources exist for vision and hearing-impaired learners, these were not always accessible or available for home learning situations. Moreover, learners with learning difficulties often struggle to engage with

independent learning. For many students however, the sheer absence of a daily school routine added a layer of challenge for those who were sensitive to change or unpredictability.

Likewise, it may be our youngest learners who were most negatively impacted during the pandemic. Given that early childhood is very much centered around “providing real-life sensory experiences, hands-on activities and meaningful face-to-face interactions” (Spiteri, 2021, p. 145), such experiences are extremely challenging to achieve in virtual teaching and learning contexts. In moving an “education for all” forward, consideration must be given to how this includes learners in the early years of school, for which technologically-mediated learning appears to have significant limitations.

While schools pivoted to online teaching and learning arrangements with minimal notice, the shift back to face-to-face delivery requires careful consideration. That is, “schools (or parts of schools) at the development extreme may be so over-confident of their innovative capacities that they take on too much too quickly, thus damaging the quality of what already exists” (Ainscow, 1995, p. 12). So how schools embrace new approaches in “educating for all” in unprecedented times, while balancing existing educational pedagogies and practice, requires a careful transition. As Audrey Azoulay, Director-General of UNESCO, has stated, “rethinking the future of education is all the more important following the COVID-19 pandemic, which further widened and put a spotlight on inequalities. Failure to act will hinder the progress of societies” (Global Education Monitoring Report, 2020, p. online).

The global pandemic has clearly evidenced that an education for all in apocalyptic times cannot be achieved through technological solutions alone. While online learning has gained much traction, there remains a population of learners for whom the basic infrastructure to enable engagement with online learning remains elusive. While online learning presents considerable opportunity for pedagogical innovation, this remains contingent on access to technology, internet and electricity. There is a desperate need to focus attention on those “left behind” as schools begin to reopen, in order to address issues of educational and social inclusion and to aim for an education for all.

Conclusion

As reasoned throughout this chapter, the pandemic has served to highlight the many inadequacies and inequities within and across our education systems, from basic access to more complex resourcing (Schleicher, 2020). The global pandemic has evidenced that there remains great provision to reconsider how we understand education in increasingly unpredictable and unstable times. Governments and educational systems need to scrutinize how inclusion and exclusion have been enacted in order to rebuild education systems that are fairer and more accessible for all learners to which they account. While the pandemic has created new layers and understandings of exclusion, primarily related to accessibility, it has also served to marginalize a population of learners through the necessitation of online learning opportunities.

There are two fundamentals if approaches to Education for All are to be inclusive and realized. That is, there must be a common sense of purpose in relation to inclusive education and a consistent use of language (Ainscow and Miles, 2008). Never has this been more opportune than in the midst of a pandemic. We do not need new techniques, but alternative ways of thinking, knowing and doing. There must be “collaboration within and between schools, closer links between schools and communities, networking across contexts, and the collection and use of contextually relevant evidence” (Ainscow and Miles, 2008, p. 15).

While preceding the pandemic, Ainscow’s (1995, p. 12) earlier thoughts captured the quandary that many educators, schools and educational systems now face: that is, “they cannot remain as they now are if they are to respond to new challenges, but at the same time they also need to maintain some continuity between their present and their previous practices.” The pandemic has therefore signaled a call to renew the commitment to the Sustainable Development Goals. How we reimagine education and indeed, an education for all in apocalyptic times, requires us to be malleable to new ideas and responsive to the unexpected in times of the unpredicted. This underwrites a moral and professional commitment to ensure “that all young people have the opportunity to succeed at school and develop the knowledge, skills, attitudes and values that will allow them to contribute to society” (Schleicher, 2020, p. 26). Such a view sits at the core of global education agendas and is the underpinning of education’s promise to learners and to future society more broadly. While the pandemic has challenged how education is understood and conceptualized amidst unprecedented disruption, it is how we move forward as a more informed and resilient society that is key to determining the future of education and schooling.

While this period of turbulence was intensified during the pandemic, it enabled schools to enact change and respond to shifting educational and social demands. Such times and turbulence provide an opportunity to actively and responsively rethink curricula, enabling a shift from the one-size-fits-all approach, toward more individualized approaches that are better tailored toward meeting the educational and social outcomes of all students and to become more authentically inclusive.

Therefore, if we are to strive for more inclusive forms of education, teachers are at the core. From this perspective, teachers’ beliefs, attitudes and actions shape the contexts in which learners engage (or not) with education (Best, 2017). It is particularly important then, to develop education systems that both support educators and their varied practices as they aim to respond to the diverse needs of learners within their care. This is no timelier than as we begin to emerge from a global pandemic.

“In thinking about what inclusive practice involves we also have to be sensitive to the complex nature of teaching” (Ainscow and Miles, 2008, p. 22). Therefore, in order to become more inclusive, we must reconsider how we think and talk, review and refine practice and attempt to create a more inclusive culture and this means that we must acknowledge that inclusion is intertwined with the cultural and social relations in which it develops. As Ainscow and Miles (2008, p. 26) have stated, “it is in the complex

interplay between individuals, and between groups and individuals, that shared beliefs and values exist and change, and it is impossible to separate those beliefs from the relationships in which they are embodied.”

Preceding the pandemic, there was little argument that new thinking on how we design and implement a high-quality education for all was needed (Bloom and Cohen, 2002). Now, intra-pandemic, that new thinking is even more necessary. There is no debate that while primary education is essential, in and of itself, it is insufficient. There remains a considerable population for whom secondary and higher education is not accessible and low standards are endemic in areas of poverty (Bloom and Cohen, 2002). Policy makers and practitioners are increasingly acknowledging systemic failures within education systems. Consequently, an “education for all” has not and cannot be achieved until we design, develop and implement new strategies, systems and determinations that reflect the ideals of the World Conference on Education for All. The pandemic presents opportunity to make a call to (re)examine, (re)consider and (re)design current local, national and global policies to be more inclusive by building unity to intersect disadvantage.

As the pandemic has served to illustrate, real change occurs through the realization of the deep crisis we were confronted with. While it is implausible that we will return to the previous iteration of “normal,” our new “normal,” however that may unfold, will ultimately be shaped through our “collective and systemic responses” (Schleicher, 2020, p. 26) to the pandemic. How we adjust and respond to the disruptions that have arisen in recent times should serve as a timely reminder of our need to continue to (re)examine the Education for All agenda, both in “apocalyptic” times and in moving forward.

Introduction

Agreed upon by over 180 countries in December 2015, the Sustainable Development Goal for Education (SDG 4) marked an important moment in global education discourse and policy. Highlighted by some as a “quality turn” in education (Sayed and Moriarty, 2020), SDG 4 addressed gaps that emerged from both the Education for All and Millennium Development Goals, the two previous global goals (beginning in 1990 and 2000 respectively) that focused on participation in education. Two of these gaps included the over-emphasis on access to education (at times, at the cost of quality) and the failure for policies focused on “all” to produce meaningful access and outcomes data for historically marginalized populations worldwide.

When suggesting SDG 4 is a “quality turn,” it is important to ask whose definition of quality is being validated? And for whom is quality for? Discussions and definitions of quality are political and embedded in different ideological perspectives. These initial orientations lead to definitions of quality that see quality as universally applied or context specific, highlighting specific aspects of education or the system as a whole, and limiting quality to formal schooling or recognizing the contributions of non-formal and informal learning (Smith and Benavot, 2021).

Utilitarian and humanistic or transformative approaches are considered the two dominant perspectives in education today (Brissett and Mitter, 2017) and each have a different understanding of quality. The aim of education from a utilitarian approach is to prepare “children to work within an established socio-economic order with the ultimate goal of achieving economic growth” (Brissett and Mitter, 2017, p. 195). Associated with this aim is an understanding of quality limited to foundational skills, generally captured through narrow school-based learning outcomes (Benavot and Smith, 2020). In contrast, the humanistic approach sees education as an avenue to address “the inequalities and injustices that are embedded in the larger society” (Maclure et al., 2009, p. 367). This human rights based approach emphasizes equity and a broader conception of quality that includes inputs, processes, and outcomes (Benavot and Smith, 2020).

Inclusive education, and its recognition that all have the right to education, clearly fits into the humanistic camp. Proponents claim that “inclusive education ... is the foundation of an education system of good quality” (Antoninis et al., 2020, p. 5). They point to evidence that inclusive practices do not just benefit students with special needs, but benefits all learners (Rambla and Langthaler, 2016; UNESCO, 2009). This is clear in two recent reviews. Kefallinou et al. (2020), in reviewing literature between 2015 and 2020 found that “including learners with disabilities in mainstream settings had no negative impact on the outcome of their peers without disabilities” (p. 4). Results from Hehir et al. (2016), following a systematic review of 280 studies, was even more positive, finding “clear and consistent evidence that inclusive educational settings can confer substantial short- and long-term benefits for students with and without disabilities” (p. 1). The presence of inclusion as a necessary component of quality in the overall goal of SDG 4—to “ensure *inclusive* and equitable *quality* education and promote lifelong learning opportunities for all” (emphasis added)—was a significant improvement over the earlier global goals in education (Brissett and Mitter, 2017).

This chapter further examines the promise of inclusive quality education in SDG 4. Specifically, it looks at the construction, communication, and early implementation of the sustainable development goal for education and asks if inclusion is indeed seen as essential for quality or if these concepts are treated independently. The chapter starts by briefly examining the history of the inclusive education movement. This is followed by an exploration of key moments in the creation of SDG 4. As we inspect the operationalization of the sustainable development goal for education—from goals to targets to indicators—we continue to ask which approach to quality is valued and whether the principles of inclusive education are seen in the practices of applying SDG 4. The implications for our results—suggesting that quality has been captured by a narrow, utilitarian perspective—are then laid out before suggesting next steps needed to ensure a more holistic, rights-based view of educational quality.

Evolution of inclusive education

Prior to the 1970s, children with special needs were generally excluded from education (Smith, 2018). The first efforts to provide children with special needs access to regular schools were seen in Italy in 1971 and the United States in 1975 (Slee, 2018). The 1975 Education of All Handicapped Children Act in the United States (replaced in 1990 by the Individuals with Disabilities Education Act) focused on providing appropriate education for handicapped children.

Globally, the 1994 Salamanca Statement represents a key moment where 92 countries acknowledged that students with special needs are able to learn in general education settings (Florian, 2019) and increased attention was placed on integrating such students into national education systems (Johnstone et al., 2020). Just over a decade later the UN Convention on the Rights of Persons with Disabilities (CRPD) was ratified, with article 24 highlighting the removal of barriers that exclude persons with disabilities as a key aspect of inclusive education (Kefallinou et al., 2020).

Since Salamanca, inclusive education has transformed from a narrow focus on the integration of students with special needs into regular school to a broader understanding (Florian, 2019; Smith, 2018) of inclusive education as part of a “social movement against educational exclusion” (Slee and Allan, 2001, p. 177). The shift in focus has been identified by Ainscow (2007) as the “inclusive turn” where mere integration is no longer sufficient and transforming schools and systems to meet the needs of all learners is now considered necessary. This is perhaps best captured in general comment 4 of the CRPD. Released in 2016 it states that “... inclusion involves a process of systematic reform embodying changes and modifications in content, teaching methods, approaches, structures and strategies in education to overcome barriers within a vision serving to provide all students of the relevant age range with an equitable and participatory learning experience and environment that best corresponds to their requirements and preferences” (p. 4). The transition to the broad view of inclusive education was, in part, accomplished by the increased merging of language of inclusive education and special education (Slee, 2018) and is the result of the human rights movement and corresponding treaties that made it clear that inclusive education is morally and legally just (Kefallinou et al., 2020).

At present, the broad understanding is the dominant approach seen in global discourse. Within this understanding some overarching principles are clear: (1) all children have the right to a good quality education, (2) education needs to be flexibly shaped to meet the needs of all learners, (3) education should meet the learner where they are currently at and move them forward, (4) all teachers should be trained in inclusive pedagogy, and (5) inclusive practices are a central part of quality education and benefit all learners. Yet, while these principles represent an ideal, how inclusive education is specifically defined and implemented remains in question (Florian, 2019). As Forlin et al. (2013) note, the abstract nature of inclusive education “may contribute to some misconceptions and confused practice” (p. 6).

In an effort to better conceptualize inclusion, Johnstone et al. (2020) attempted to map the discourse of inclusion by drawing upon legal and political continua. For example, inclusion can either be framed as universal (narratives of “all”) or plural (as advocacy for particular groups’ rights to education). Similarly, inclusion can be characterized as social (an act of welcoming into existing systems) as well as relational (that which requires resource redistribution to diminish historical exclusion and marginalization). Based on these continua, quality inclusive education could be theoretically framed as:

- Universal-social: Inclusion for all by welcoming every child, adolescent, and adult into existing education systems (i.e., access).
- Universal-relational: Inclusion for all by welcoming every child, adolescent, and adult into existing education systems and distributing necessary additional resources for those in need (i.e., accommodations, scholarship support).
- Plural-social: Adjusting systems to be more responsive to diversity within existing systems without prioritizing needs of one group over another (i.e., multiculturalism, cultural responsiveness).
- Plural-relational: Adjusting systems to be more responsive to diversity within existing systems and diverting resources toward historically marginalized or excluded groups.

While at first glance these continua appear to replicate some of the narrow and broad views outlined above (with plural representing a narrow view and universal representing a broad view), this is not the case. Plural-social and plural-relational conceptualizations are not suggesting that all children, adolescents, and adults do not have the right to access education, but instead that when they access education their individual talents and needs are recognized. In short, a universal conception fails to recognize differences within the classroom while a plural approach embraces diversity. The other key difference between universal and plural is whether the existing system is maintained or adjusted. While the former aligns more with earlier attempts at integration the latter better represents the transformative desire of the humanistic perspective. Finally, distinctions between social and relational conceptions depend on whether needs of particular groups are recognized and addressed. Some may question whether the needs of historically marginalized groups can be met in systems that perpetuate their exclusion. Others may argue that the desire to have all learners in education may be at odds with tailored approaches to equity. This, however, need not be the case. As Schuelka et al. (2019) suggest, representational acknowledgment is one part of a broader vision of inclusive education that has “both a systems focus and a focus on specific marginalized and/or disadvantaged groups. They do not need to be mutually exclusive” (p. xxxvi).

The creation of SDG 4

The 1990 World Conference on Education for All in Jomtien, Thailand laid out the first of a series of global goals for education. The corresponding Education for All (EFA) movement highlighted the right to education for all, regardless of background and

contributed to broadening the view of inclusive education (Florian, 2019). The sustainable development goal for education, agreed upon in late 2015, is the latest iteration of the global goals. Unlike prior efforts, the creation of the SDGs was hailed as an open, collaborative process that included representatives from civil society, government, and the scientific community (Johnstone et al., 2020). Merging efforts from prior global development architectures (Millennium Development Goals and Rio Summit on the Environment and Development), the 4-year consultative process of the SDGs included meetings in over 60 countries and a My World survey, capturing public priorities (Smith, 2019). As Jordan Naidoo, the UNESCO Director of the Division for SDG Education Support and Coordination wrote in 2016, the lead up to the SDGs was "... arguably the most inclusive process of consultation in the history of the United Nations."

Over this 4-year consultation, there were at least eight key outputs that shaped the creation of SDG 4. Appointed by the UN Secretary General in 2012, a High Level Panel of Eminent Persons, chaired by leaders from Indonesia, Liberia, and the UK produced a report in May 2013 that largely reflected the goals of the UK's development agency (DFID). In April 2014, UNESCO's EFA Steering Committee released a position paper following their regional consultations with governments and NGOs. In part to challenge the EFA Steering Committee paper, the Sustainable Development Solutions Network (SDSN) produced a lobbying document in May 2014. Written by the leadership council of the network, high level political figures, leading academics, and representatives from business were included, but no leading figures from the EFA movement. In contrast, the Muscat Agreement largely reflected the position of the EFA Steering Committee. Led by the Director General of UNESCO, the agreement was the result of the May 2014 global Education for All Meeting which included national ministry officials, multi- and bi-lateral organizations, NGOs, and private sector leaders (Unterhalter, 2019).

In July 2014, the Open Working Group (OWG) published their progress report, suggesting what is now the 17 SDGs. Created to provide an alternate vision to the high level panel, the OWG consisted of 30 seats, each representing 3 countries, and heard input from multiple stakeholders, including teacher unions, NGOs, and indigenous peoples groups. The UN Synthesis Report, published in December 2014, attempted to bring the various tracks together and ultimately endorsed the view promoted by civil society and the EFA Steering Committee. The last two documents included the Incheon Declaration, which largely laid out SDG 4 as we know it today, and the Education 2030 Framework for Action, which provided an initial framework for how to implement the aims laid out in the Incheon Declaration. The declaration was the outcome document of the May 2015 World Education Forum that included representatives from government, civil society, and seven UN organizations. The framework was agreed upon by 184 countries at UNESCO headquarters in November 2015 (Unterhalter, 2019).

With many stakeholders present, clear, rival visions can be seen in the desired aims of education. Unterhalter (2019), in her review of these eight outputs, highlighted that those without a strong civil society or EFA presence tended to adopt a utilitarian view of quality education, emphasizing education's role in economic development. On the contrary, meetings with a diverse delegation that better represented humanity tended to adopt a holistic, humanistic view of quality education. Table 1 expands on the work of Unterhalter (see her work in the Definition of Quality row in Table 1) by examining how inclusive education is represented in these key documents.

The first observation from Table 1 is that inclusive education is rarely mentioned specifically. The only attempt to define inclusive education beyond general statements on inclusion or "all" is found in the Education 2030 Framework for Action. At the surface level it appears that inclusive education is considered part of quality in six of the eight documents. This is often done by repeating what is now (in slightly modified form) the overarching goal of SDG 4, which was first proposed in the EFA Steering Committee report, "ensure equitable and inclusive quality education and lifelong learning for all by 2030."

The two reports with a utilitarian perspective are clear by their general focus and noticeable absence of inclusion as part of quality education. The High Level Panel focuses on the learning crisis and rates of return on education and believes quality entails meeting "minimum standards" through measurable learning outcomes. In a similar vein, the SDSN report focuses on skill attainment and education as a means to an end, with quality associated with a (albeit wider) range of learning outcomes.

Mentions of "all" are present throughout the reports. What has been presented is only an example of what is included, with multiple more "all" statement found in the documents, notably the Incheon Declaration and Education 2030 Framework for Action. In reviewing "all" statements they tend to support access to or outcomes of education, rarely mentioning the process of education applied within the system. Once again, the Incheon Declaration and the Education 2030 Framework for Action are noticeable exceptions. Both recognize that changes are necessary to meet the needs of learners. The Incheon Declaration states that "inclusion and equity in and through education is the cornerstone of a transformative education agenda" and the framework points to changes in public policy and teacher training as necessary steps to reshape the system.

Operationalization of SDG 4

Drawing directly from the Incheon Declaration and as outlined in the Education 2030 Framework for Action, at first glance it appears that SDG 4 has embraced a humanistic view of education quality. Rightfully celebrated as an important addition to the overarching goal of SDG 4, the voice of inclusive education, and other advocates of the humanistic approach, diminished as SDG 4 was operationalized.

Under each overall goal in the SDGs, there are corresponding targets and indicators. The initial plan was to have four types of indicators that would complement each other and allow for national flexibility to recognize the different local realities (Brissett and Mitter, 2017). Global indicators would include a small number of emphasized indicators that capture the essence of the target and are comparable across countries. Thematic indicators are additional, cross-national comparable indicators that fit under each target.

Table 1 Inclusion and quality as understood in the key outputs preceding SDG 4.

	<i>High level panel (2013)</i>	<i>EFA steering committee (2014)</i>	<i>SDSN report (2014)</i>	<i>Muscat agreement (2014)</i>	<i>OWG SDG proposal (2014)</i>	<i>UN SDG synthesis report (2014)</i>	<i>Incheon declaration (2015)</i>	<i>Education 2030 framework for action (2015)</i>
General focus	Focus on learning crisis, minimal mentions of barriers, highlights rate of return on education	Human-rights based, focused on gender, some mention past learning outcomes to include global citizenship and sustainable development	Focus on skill attainment and livelihoods—includes social and cognitive skills, problem solving and critical thinking	Holistic and right-based approach. Education is fundamental right and essential for peace, economic growth, equality, & global citizenship	Focus on poverty eradication and sustainable, inclusive economic growth. More on SDG 4.7—gender equality, peace/non-violence, citizenship	End poverty while meeting human needs & respecting human rights. Promote sustainable & inclusive economic growth, development, & environmental protection	Renewed education agenda that is holistic, ambitious and aspirational, leaving no one behind. Ed as public good & fundamental right	Comprehensive, holistic, ambitious, aspirational & universal. “Rights-based & inspired by humanistic vision”
Definition of quality (Unterhalter, 2019)	Meeting “minimum standards” of reading, writing and counting at primary level; meeting measureable learning outcomes at junior secondary	Developing capacity to learn, meeting global benchmarks of learning outcomes, fully participation in society, access decent work; express values (global citizenship & sustainable development)	Wide range learning outcomes, reduce dropout in higher education, develop knowledge economics	No definition for early years, primary and secondary. For youth and adults’ increasing participation in society, enhancing peace, sustainable development and global citizenship	No definition of quality but associated with free & equitable schooling, affordable vocational education and relevant skills	No definition of quality but discussion links education with dignity, sustainability, gender equality, and enhancing know how	Very full definition of quality looking at practice, includes rights and gender equality	Links quality with the humanistic inclusive vision of SDGs and with learning processes as well as outcomes
Inclusive education mentioned	Yes, once in appendix	No	No	No	No	No	No	Yes, multiple. “Inclusive education for all should be ensured by designing and implementing transformative public policies to respond to learners’ diversity and needs, and to address the multiple forms of discrimination and of situations.” Teacher training, meet most marginalized, necessary to transform education system

Inclusive education as part of quality	No	“Ensure equitable and inclusive quality education and lifelong learning for all by 2030”	No	“Ensure equitable and inclusive quality education and lifelong learning for all by 2030”	“Ensure equitable and inclusive quality education and lifelong learning for all by 2030” & in target 4a on inclusive environments	“Ensure equitable and inclusive quality education and lifelong learning for all by 2030” & in target 4a on inclusive environments	“Ensure equitable and inclusive quality education and lifelong learning for all by 2030” “inclusion and equality in and through education is the cornerstone of a transformative education agenda”	“Ensure quality and inclusion and equality in and through education and address all forms of exclusion and marginalization, disparity, vulnerability and inequality in education access, participation, retention and completion and in learning outcomes.”
Mentions of “all”	“We need to ensure all children, regardless of circumstance, are able to enroll and complete a full course of primary and lower secondary education and, in most cases, meet minimum learning standards.”	“Equitable access to education for children, youth and adults should be provided for all and at all levels of education”; “All children complete free and compulsory quality basic education of at least 10 years and achieve relevant learning outcomes”; All learners acquire knowledge, skills, values and attitudes for global citizenship and sustainable development.”	“All girls and boys complete affordable and high-quality early childhood development programs, and primary and secondary education to prepare them for the challenges of modern life and decent livelihoods. All youth and adults have access to continuous lifelong learning to acquire functional literacy, numeracy, and skills to earn a living through decent employment or self-employment.”	All girls and boys complete free and compulsory quality basic education of at least 9 years and achieve relevant learning outcomes [target 2]”; “All learners acquire knowledge, skills, values and attitudes to establish sustainable and peaceful societies [target 5]	“All girls and boys complete free equitable and quality primary and secondary education leading to relevant and effective learning outcomes” [T 1]; “All girls and boys have access to quality early childhood development, care and pre-primary education” [T 2]; “All learners acquire the knowledge and skills needed to promote sustainable development” [T 7]	“All children and adolescents have a right to education and must have a safe environment in which learn.”	“No education target should be considered met unless met by all.” “All children have access quality early childhood development, care and education.” “We commit to promoting quality lifelong learning opportunities for all, in all settings and at all levels of education.”	Throughout document and mirroring current SDG4 targets
Identified target subgroups	None	Gender, most marginalized	Girls, children in hard to reach areas, income groups, disability	Girls, most marginalized	Gender, disability, indigenous people, children in vulnerable situations	Gender, age, race, ethnicity, migration status, geographic location, disability, unemployed	Most disadvantaged, those with disabilities	Gender, most vulnerable, person w/disability, indigenous peoples. Large list of demographics

Regional indicators recognize that commonalities in educational aim and system are more likely at the regional level and as thus countries within similar regions were encouraged to establish indicators related to SDG 4 targets. Finally, national indicators provide an additional level of autonomy, with countries encouraged to adapt the SDGs to their local needs or suggest additional complimentary indicators that represent their national interest. In reality only global and thematic indicators are used with any regularity. For example, in [Smith's \(2021\)](#) analysis of 32 voluntary national reviews—submitted by countries to report their progress on the SDGs—he found that all global indicators were reported at some point across the 32 countries, but 45% of thematic indicators were not reported by a single country, while regional and national indicators were absent or nearly absent. The prominence of global indicators may be due to their obligatory reporting status and their appearance as often the only indicators included in global reports and on websites, both of which encourage states to target resources to global indicators ([Smith, 2019](#)).

It is disturbing, then, that the process of moving from SDG 4 targets to the associated global indicators have resulted in a narrowed down and simplified notion of education that fails to capture the essence of the overarching SDG 4 goal or the related target. While this is most apparent in SDG 4.1, where the global indicator fails to capture completion, equitable, relevant, effective, or free descriptors of education and quality is limited to test scores ([King, 2017](#)), the movement from relatively more humanistic targets to utilitarian global indicators is found across SDG 4 ([Unterhalter, 2019](#)).

The utilitarian capture of quality

A utilitarian perspective has captured the understanding of quality in the global indicators, the primary way progress on SDG 4 is communicated. Various factors help explain this capture. First, might civil society be fatigued? Civil society and EFA partners lobbied substantially in the build up to SDG 4. This is noticeable in the more humanistic approach taken in six out of the eight documents examined in [Table 1](#) and the structural changes demanded in the Muscat Agreement and the Incheon Declaration, such as the need for “transformative public policies to respond to learners’ diversity and needs, and to address the multiple forms of discrimination and of situations, including emergencies, which impede the fulfillment of the right to education” in the latter. In directing significant resources and energy to meet the moment in Incheon, is there substantial capacity left to continue the fight.

Second, the operationalization process itself tends to rely on a specific, technical skill set. Led by the UNESCO Institute of Statistics (UIS) and working with 27 national statistical offices, the indicator creation process included a starkly different group of stakeholders, relative to pre-SDG consultations. Additionally, the need for quantifiable, comparable indicators limit the potential metrics for global indicators.

Third, there is substantial, disproportionate investment in metrics that represent a simplified, utilitarian view of quality as learning outcomes. For donors, they are seen as easily communicated ways to measure impact ([Winthrop and Anderson Simmons, 2013](#)) and are part of a larger shift of donor support toward learning assessments and outcomes ([Benavot and Smith, 2020](#)), including earmarking contributions to UIS ([Wulff, 2020](#)). The Global Alliance to Monitor Learning (GAML) is a self-funded group under UIS, tasked with creating indicators for SDG 4.1, 4.2, 4.4, 4.6, and 4.7. The largest supporters of GAML are the UK’s DFID, Australia’s Department of Foreign Affairs and Trade (DFAT) and the Hewlett Foundation. Although charged with the creation of indicators for five SDG 4 targets, SDG 4.1 is prioritized. This is clear in GAML’s Results Framework, where two out of every three targets focus on 4.1, and in the advancement in the global indicator for SDG 4.1. Over the first 5 years of the SDGs, the global indicator from 4.1 developed from having no established methodology (tier 3) to being conceptually clear with an established methodology (tier 1). Progress of the global indicator for the more humanistic SDG 4.7 has stalled at tier 3.

Finally, no robust inclusive alternate definition of quality was present in the outputs leading to SDG 4. In reviewing [Table 1](#) there is no definition and little recognition of “inclusive education” as a valued approach to education that benefits all learners ([Anderson and Boyle, 2015](#)). Notions of inclusion, when incorporated, focus on integration into the system; learners accessing and adapting to the system instead of a system adapting to learners. This is illustrated in overreliance on top-level “all” statements that focus on access. [Johnstone et al. \(2020\)](#) identified a similar trend when they recognized that across the SDGs the term “inclusion” is included 40 times, but it is undefined and limited to notions of “all.”

Competing agendas and the re-fragmentation of inclusive education

The reductionist process that takes place in operationalizing SDG 4 echoes the work of some who have researched what happens to competing principles when they are attempted to be put into practice. While at the abstract principle level, a humanistic ideal of inclusion as quality is easy to envision, as multiple principles, or views on quality education, can be held “without compromise and without constructing an a priori hierarchy of principals” ([Clark et al., 1999](#), p. 173). In practice, however, principles are thrust into competition and thus will “always be partial and compromised” ([Clark et al., 1999](#), p. 173). The result is inclusion now having to compete with a version of quality, narrowly defined as learning outcomes.

As [Slee \(2013\)](#) pointed out, more humanistic values of education, such as inclusion and equity, are often “inaudible when located amid more strident educational discourses” (p. 6), such as testing regimes. As the views of quality are derived from different underlying ideological perspectives, it is challenging, if not impossible “for any educational policy initiative to equally serve such conflicting value-laden discourses” ([Brissett and Mitter, 2017](#), p. 182). In the end there is a real fear the inclusive education agenda will be overshadowed and drowned out.

Ultimately, however, it is not just that utilitarian definitions of quality take attention away from the inclusive education position, it is that the definition of quality held up by this perspective actively undermines efforts toward inclusive education (Allan, 2012). The capture of quality as testing is detrimental to the ideal of inclusion. The reliance on learning assessments creates structural barriers that limit participation in groups less likely to sit for cross-national assessments (Johnstone et al., 2020). The ranking, blaming, and shaming of individuals associated with test scores can increase the pressure felt by individual learners (Boeren, 2019), lead to labeling learners, and reinforcing a deficit view (Ainscow, 2020).

Positioning inclusion as separate from quality also promotes a reversal to an earlier narrow version of inclusive education. Instead of transforming education to meet the needs of all learners, in achievement-focused educational environments, access to the opportunity to demonstrate achievement is considered a form of inclusion. For example, Almond et al. (2002) argued nearly two decades ago that students with disabilities should participate in learning assessments for accountability purposes—but that participation must include appropriate accommodations. The authors' logic was that participation would highlight systemic gaps in instruction for this population. Likewise, LeRoy et al. (2019) and Smith and Douglas (2014) advocated for greater inclusion of children with disabilities in PISA testing, but acknowledged the sampling and accommodations limitations of such inclusion. In each of these cases, however, the participation of children with disabilities in learning assessments was argued to be a mechanism for revealing systemic failures.

The reduction of inclusive education to the disaggregation of data of a few identified groups is not without its benefits, although the fragmentation of the inclusive education coalition can lead to in-fighting for available resources. Johnstone et al. (2020) argued that the SDGs provided *some* indication or acknowledgment of historic exclusion and discrimination. By naming excluded populations, the SDGs took what Mégrét (2008) would call a plural rights approach. Further, in the call for addressing the specific needs of girls, low-income individuals, rural individuals, and persons with disabilities, the SDGs hinted at a “relational” approach to inclusion that acknowledged resource inequalities as a source of exclusion (see Gupta and Vegelin, 2016). According to Abualgehaib et al. (2019), the collection of good quality data is necessary for identifying cases of exclusion and “crucial to achieving inclusion” (p. 3091). Additionally, the disaggregation of data in SDG 4 highlights the intent of the global community to move past the “politics of silence” present in past global goals and recognize the needs of students with disabilities (Anastasiou and Keller, 2014). Useful data for such a task might include educational assessment data (LeRoy et al., 2019) or disability identification data (Abualgehaib et al., 2019). The Washington Group Question Sets are an example of the latter, to date at least one of their sets have been used by over 70 countries in their censuses or other national data collection instruments, such as those used in Education Management Information Systems (EMIS).

Conclusion

If continuing on its present trajectory, SDG 4 will fail to reach its aspirational goal of inclusive quality education. A humanistic view of quality as a transformed education system, meeting the needs of all learners is far off. Quality as testing reproduces a status quo that disadvantages some students and labels others as “less than.” While the overall goal of SDG 4 hints at a transformative agenda, the SDGs still fall short of the drastic redistribution recommendations either within governments or between high- and low-income countries. Further, if “quality” is defined as outcomes, the SDGs provide expectations for equality in outcomes among some groups (e.g., girls and boys in Target 4.1), but outcome targets are overlooked for children and youth experiencing intersectional exclusion, as persons with disabilities, indigenous peoples, and children in vulnerable situations are named, but Target 4.5 only requires states parties to “ensure equal access” of these groups and does not address quality.

The SDGs stand at a crossroads between universalist narratives and population-focused constructions of inclusion. Universal narratives of “all” fail to acknowledge that exclusion is a choice in policy and practice that must be addressed through affirmative action approaches. At the same time, plural definitions of inclusion are often still assumed to be a form of education focused on children with disabilities or special needs that are designed to address a perceived deficit or dysfunction (Slee, 2011). This latter approach was used to both provide a pathway to children's rights to education and as therapeutic and “normalizing” for children with presumed pathologies. In SDG 4, such inclusion is limited to the mere presence of particular children without any significant expectation of system change or outcomes for such children. This is insufficient and fails to account for the basic principles of the broad view of inclusive education.

Increased efforts are needed to challenge the definition of quality, positioning inclusion at the center. As Brissett and Mitter (2017) acknowledge, the “aims of education must be expanded such that ‘quality’ education is no longer strictly associated with standardization, efficiency, and employment, but instead viewed as a fundamental human right and a catalyst for social change” (p. 201). The SDGs do not do enough to shift the normative center of education systems that see difference and define it as “additional support needed.” Continuing with the status quo means that, even when broad goals of inclusive education are held by governments in principle, in practice exclusion rituals continue (Florian, 2019).

Part of transforming toward inclusive quality education is recognizing that every learner is unique. When difference is considered ordinary, education values diversity and inclusive approaches are commonplace and seen as the norm. As we all have multiple, intersecting identities (Antoninis et al., 2020), we must see individual differences “not as problems to be fixed but as opportunities to enrich learning” (Ainscow, 2020, p. 6).

Mechanical solutions that work around the periphery of education systems are not enough. Real systems change starts with a broad view of inclusive education and a recognition that systems need to change for learners, not learners changing to fit in

systems. The recommendations of the 2020 Global Education Monitoring (GEM) Report are a good first step. Their first recommendation urges countries to adopt a wide understanding of inclusive education, including everyone regardless of identity, background or ability. The adjustments necessary in such a system must be part of a coherent education plan at all levels. The 2020 GEM Report can be a valuable tool for inclusive education advocates as they work to reposition inclusion at the heart of quality. A renewed, collective effort from the inclusive education community is needed. Working together we need to push beyond access for all and discuss what inclusive education looks like in practice. Emphasis and additional evidence demonstrating the relationship between inclusive education and pedagogy and quality education for all is required to clearly communicate that quality is not possible without authentic inclusion.

Introduction

Any seemingly logical reform in education policy and practice will always run up against the illogic of people. Actors in a social system will make decisions based not upon hard evidence, but more upon their own lived-experiences and the logic of the social system itself; the historical, cultural, and contextual norms that shape the production of institutional formal education. There is a wide range of support in academic literature that has firmly established the policy-to-practice gap. In truth, I would argue that highlighting this gap has become too clichéd to remain interesting, in that the work to establish this pattern is already definitive. Over 25 years ago, [Tyack and Cuban's \(1995\)](#) *Tinkering Toward Utopia* provided a landmark and comprehensive analysis on education policy and practice in the United States. In their analysis, Tyack and Cuban analyzed education policy cycles and broke them down into three phases: policy talk, policy action, and implementation. In each phase of a policy cycle, there is a constant negotiation between competing interests, values, and realities among actors and, in the end, education reform becomes a chimera of disparate interpretations. This is a similar phenomenon also found at the international level, in what [Steiner-Khamsi and Stolpe \(2006\)](#) label the “global speak” of education reform ideas that travel globally, but become something quite different in terms of policy action and implementation. As [Malen \(2006, 89\)](#) succinctly states, “policies unfold in nested contexts.”

In this chapter, I argue that reform in the inclusivity and diversity of education—so-called “inclusive and special education”—has too often made assumptions in the policy cycle of talk, action, and implementation. Arguing for greater reform and inclusion in education globally has never quite transcended the human rights discourse of “because it’s the right thing to do.” Inherent and fundamental human rights matter, of course, but are not necessarily effective in comprehensive education system reform. This is because education systems are complex systems. Aligning positive social values such as “inclusion” across an entire complex social system takes extraordinary coordination that is almost never achieved. Similarly, the advocacy for greater inclusivity and diversity in education also runs up against the problem that the complex system of education has been historically and culturally rooted in exclusion and elitism. These are, obviously, competing values to inclusion and diversity.

In this chapter, I will first explain what I mean when I assert that education is a complex system, particularly in the context of inclusion and diversity in education. Next, I will provide two recently developed theoretical models for further understanding and analyzing complex education systems. I will then provide a short case study and summary of my work in the Himalayan country of Bhutan that will illustrate the difficulty of aligning inclusive education values across a complex system. At the conclusion of the article, I will provide paths forward to better understand and recognize complexity in education systems.

Education as a complex system

By arguing that education is a complex social system, I borrow many ideas from complexity theory and chaos theory from the physical sciences as to how elements in a complex and chaotic system interact, the consideration of closed and open systems, and in the alignment or misalignment of systemic attributes. While there is not always a direct correlation between the oft-predictability of physical phenomenon and the oft-unpredictability of social phenomenon, there is an increasing awareness between the two poles of science that the inorganic world is much more dynamic and complex; and the organic world does not fit neatly into formulas and provable hypotheses. For an accessible definition of a complex system, I much prefer to cite [Amaral and Ottino \(2004, 148\)](#):

A complex system is a system with a large number of elements, building blocks or agents, capable of interacting with each other and with their environment. The interaction between elements may occur only with immediate neighbors or with distant ones; the agents can be all identical or different; they may move in space or occupy fixed positions, and can be in one of two states or of multiple states.

While Amaral and Ottino are describing complex systems in nature, I believe that this is an approachable means in which to understand the dynamics of an education system. First, any education system will contain a large number of elements—here, a plethora of education agents and actors such as children, teachers, paraprofessionals and other education support staff, parents, school leadership, school administration, district/local education authority staff, policy makers from local to international, and the numerous community persons and groups that enter a school every day, just to name a few. These actors all interact with the education system bringing their own understandings, world views, contexts, histories, and so on. To quote a previously-written article on the subject: “Complex systems are open and nested, meaning that there is little to no boundary between elements and surroundings, between inputs and outputs, and elements within the system are complex systems within complex systems ever unfolding like a fractal” (Schuelka and Engsig, 2020, 5).

The assertion that education is a complex system is not necessarily revolutionary, but is new in how it understands the dynamics of element-actors within an open, boundary-less, and self-reflexive space of constant and dynamic interaction between elements and surroundings. There certainly is an element of Practice Theory (Ortner, 2006) to this way of thinking, as well as other sociocultural means of policy analysis (Shore and Wright, 1997; Sutton and Levinson, 2001). Complexity—sometimes under a different term or phrase—provides the underlying assumption in many education studies and theoretical arguments (e.g., Davis and Sumara, 2006; Opfer and Pedder, 2011; Walton et al., 2020). In the section below, I will further elaborate upon education as a complex system, while also providing two theoretical models for understanding and analyzing the complexity within an education system.

Theoretical models for understanding complexity in education systems

Within a complex system, there is not necessarily an absolute beginning and ending to analysis. What we observe when we attempt to understand and analyze a particular dynamic or phenomenon within a complex system is only a brief snapshot in time. However, in order to understand even this brief snap-shot we must also recognize that it contains multi-dimensionality and endless subjective interpretation. That being said, in recognizing education policy and practice, it falls roughly upon the same phases as asserted by Tyack and Cuban (1995): policy talk, policy action, and policy implementation.

In terms of policy talk, for the purposes of this argument I mean the discourses across all elements of society, often influenced by a diversity of world-views, histories, contexts, cultures, and values. Policy talk is self-reflexive and complex in that it both shapes, and is shaped by, societal trends and discourses. To use the Tyack and Cuban (1995) definition, I also mean that policy talk is how we identify and frame societal problems and policy solutions. There is just as much importance to the problems that are “silent” as to the solutions that are ideological hammers “in search of a nail.”

For policy action, in my interpretation this involves the decision-making process of those that enact policy at all levels of implementation. This can mean at an international-national level, such as policy transfer and borrowing between countries (Phillips and Ochs, 2003; Rappleye, 2006). Policy action can also mean the decision-making and negotiation that occurs as an enactment of policy, in which “policy goals, practices, and outcomes become negotiable, context-informed, and dependent on the meanings that policy actors make in their own situated context” (Massouti, 2018, 185).

Implementation is distinct from policy action in that implementation involves the practice and production of education policy down to the micro-classroom level. In terms of understanding implementation, Honig (2006, 14) argues, “Whereas past implementation research generally revealed *that* policy, people, and places affected implementation, contemporary implementation research specifically aims to uncover their various dimensions and *how and why interaction among these dimensions* shape implementation in various ways.” The actual implementation of policy into practice is perhaps the most complex part of the complex system, if you will, in that it involves all elements in a boundless system. Put another way: “... we understand policy as a complex, ongoing social practice of normative cultural production constituted by diverse actors across diverse contexts” (Levinson et al., 2009, 770).

In a previous article, I and my co-author Schuelka and Engsig (2022) provide a theoretical model for the purpose of understanding and analyzing the multi-dimensionality of a complex education system. We term this as Complex Educational Systems Analysis (CESA) and it is visually represented by the Complex Educational Systems Analysis Cube (CESA³). The CESA³ can be seen in Fig. 1 below, and I will explain each dimension on the cube in turn. As in the original article, I will note here that the CESA³ is not a tool for quantitative measurement, as there is no actual volume within the cube itself. In other words, there is not a place where a datum point could be located between dimensional axes, as by definition a complex system is open, dynamic, and boundless.

On the multi-level dimension axis, there is a spectrum of focus from the micro-level to the macro-level. This means that any policy talk, action, or implementation occurs at any or all levels—from international discourses and initiatives such as from the United Nations agencies, down to the everyday interactions between the teacher and student in the classroom. The focus and understanding of multiple levels is influenced both from Bronfenbrenner’s (1979) ecological system theory, as well as comparative case study methodology (Bartlett and Vavrus, 2017; Schuelka, 2018a).

While policy can occur at and between different analytical levels, it can also be enacted across a wide variety of communities. There are essentially an infinite number of ways that we can organize community groupings and pairings for the purpose of analyzing an education phenomenon. Here in the CESA³, we propose six key communities that have analytical power. Policy communities are both formal and informal, explicit and implicit, and can be found along the levels of the previous axis. Formal and professionally-led teaching and learning communities are those structured, institutional arrangements between adult teachers and child learners that we often associate with education. Adult-child communities are less formal and occur outside of the formal

Fig. 1 The complex educational systems analysis cube (Schuelka and Engsig, 2022).

learning in the classroom, but still within the “place” of school such as the playground or the hallway. Informal and adult organized communities are still directed by adults, but occur both in and out of the “place” of school. For example, this could be a sports practice or an after-school club. Self-organized communities are child-led and do not involve adults. For example, this could be self-organized play during recess or interactions on social media that project specific identities and norms. Children may organize themselves around a shared appreciation for a particular online game, or music group, or entertainment universe. Child-child communities are interpersonal dynamics between two or a small group of students.

The third dimensional axis has to do with the attributes of education: access, quality, and utility. These attributes are what we argue to be the three main values of education in relation to the attributes and goals of society. The first attribute, access, is the question of “who goes to school and to whom does the school serve?” The second attribute, quality, is the question of “what do they do there?” and the third attribute, utility, is the question of “what is the purpose of going to school and what are the outcomes of going to school?” In responses to these three questions, complex education systems provide both explicit and implicit values. For example, there has always been a tension in public education between the notion of it serving the individual interests of the child (social mobility and achievement) and the collective interests of society (democratic equality and social efficiency) (Labaree, 1997). How we, as a complex system, believe in the purpose and utility of education ultimately affects who is embraced and served by the school, and the quality of the education provision.

In order to further analyze education values in applicable practice across all the dimensions of the CESA³, I and Kezang Sherab (2022) have provided a second theoretical framework that can be used to specifically evaluate various elements within a complex educational system. The Educational Values Evaluation and Design (EVED) Framework fits inside of the CESA³ in that any societal and educational value contains the multi-dimensionality of levels, communities, and attributes. The visual representation of the EVED framework can be seen in Fig. 2.

The EVED framework is an Ishikawa diagram that delineates various elements that form a particular, or inter-related, set of educational values. The use of this framework can specifically highlight various elements that either align or misalign and project certain educational values. The EVED framework can be used both to design a reform or value-change in an education system, or to evaluate the effectiveness of a reform or value-change after the fact. The nine elements identified—children, teachers, materials, curriculum, pedagogy, policy and governance, economy, socio-cultural factors, family and community—are a comprehensive, but not exhaustive, take on the elements that inform how a societal or educational value is produced and enacted through schooling. These are also broad categories which can be further dissected. For example, materials could include the school building, campus, books, experimental equipment, classroom furniture, technology, or even the resources available to the family and community outside of the classroom. None of the elements are mutually exclusive and, like the CESA³ and complexity in education in general, there is interdependence and dynamism between all elements. In terms of educational values in Fig. 2, these are just a few examples but certainly not an exhaustive list.

In the next section of this chapter, I will look specifically at inclusion and diversity in education as a value in a complex system, applying the CESA³ and EVED framework on the case of Bhutan. The case of Bhutan in the context of this chapter is a summation of my longitudinal work there since 2012 with the support of a wide variety of projects funded by the University of Minnesota, British Academy, UK Economic and Social Research Council, UKAid, the Toyota Foundation, and the European Union.

Fig. 2 The educational values evaluation and design framework (Schuelka and Kezang Sherab, 2022).

Inclusion and diversity as an educational value in a complex system

Having laid out the theoretical and analytical frameworks for education in a complex system, I now turn my focus to the particular case of inclusion and diversity as an educational value. As I argued in the introduction to this article, inclusion and diversity in education is too often framed as a human rights issue within the argument of “because it’s the right thing to do” along a narrow set of criteria and target population, without working toward reform of the entire complex education system. Since the Salamanca Statement in 1994 supporting inclusive education as a human right, there has been much effort in assuming this to be the case and then all of the academic and international development energy has been put into identifying the barriers to realizing this right. In my view, this has been myopic and a failure to recognize that an education system is complex. For example, in many ways the Education for All push in the early 21st century had a counter-productive effect in that the number of children given access to school was greatly increased—which is positive and notable—but there was very little in terms of increasing the quality of education provision, the quality of teachers, the quality of materials, the availability of resources, and the alignment of increased educational opportunity with increased (or not) economic opportunity. By providing more education access for those students that were traditionally marginalized by education systems—for example, students with disabilities—the classrooms and teachers did not subsequently adjust themselves to a more diverse and heterogeneous student population, nor was there adequate and compensatory resource allocation, training, and adjustment to the curriculum and the structure of schooling. A classic example of this is England, which embraced inclusive education early, but has seen a significant increase in specialized and segregated education provision for students with disabilities because government schools were overwhelmed and under-resourced (Black, 2019).

If we are to assume that inclusive education is a human right—as the United Nations Convention on the Rights of Persons with Disabilities would suggest—then we can view inclusion and diversity in education as a societal value and view it through the theoretical lens of Complex Educational Systems Analysis using the Educational Values Evaluation and Design Framework. In a generic sense, any study could conduct this kind of analysis by examining an educational value across elements, times, levels, and communities. In this article, I will use Bhutan as an illustrative case study to demonstrate the application of the theoretical frameworks. When discussing inclusive education in Bhutan, I am specifically referring to education for children with disabilities as other attributes such as language and ethnicity are not given policy consideration in Bhutan.

Bhutan is a small country about the size of Switzerland nestled between India and Tibetan China and is located entirely in the Eastern Himalaya. The Bhutanese population is approximately 780,000—compared with approximately 8.4 million in Switzerland for some comparison—and most Bhutanese are still primarily involved in small-scale agricultural production. The agrarian cultural heritage of Bhutan is rapidly changing, however, with increased youth urbanization in the capital, Thimphu, and the border town with India, Phuentsholing. While I will not take the space to provide a full historical and cultural context of Bhutan (see Schuelka and Maxwell, 2016 for a more comprehensive overview), I will very briefly state that formal secular education in Bhutan is relatively recent, having been initiated slowly in the 1960s with the explicit purpose of human capital development. The education system of Bhutan was greatly influenced by India during its early days. Today, nearly a quarter of the entire population of Bhutan attend some form of formal secular schooling.

In terms of inclusive education in Bhutan, this was an initiative that began in the 2000s with the creation and identification of Special Educational Needs (SEN) school sites in various locations across Bhutan (Rinchen Dorji and Schuelka, 2016). With the support of UNICEF and international consultants, some students with disabilities were “mainstreamed” and were “pushed in” and “pulled out” according to their needs. In 2019, the National Policy for Persons with Disabilities was enacted in Bhutan and included requirements for all schools to make reasonable accommodations, although also indicating support for separate and special provisions. This was a codification of a previous draft policy that has been in place since 2012, called the National Policy for Special Educational Needs.

In my original ethnographic fieldwork in Bhutan from 2012 to 2013, my research was primarily focused on understanding the discourses of disability and inclusive education as it flowed between micro, meso, and macro-levels. I also wanted to understand where inclusive education “came from” and entered into Bhutan as previously the idea of Education for All was not a primary concern for the Bhutanese education system. I found that there was a confusing and often-conflicting array of exogenous ideas brought into Bhutan, representing both a human rights-inclusion perspective and a medical-special perspective, that mixed together with endogenous Buddhism and the Bhutanese development philosophy of Gross National Happiness (Schuelka, 2015). The understanding of disability and inclusion morphed and changed as it passed through various actors and institutions, and was shaped by certain individual policy actor-“influencers.”

However, while Bhutan was providing greater access to education provision for a greater number of students, there was not a similar increase in the provision of teachers or the quality of education. During my original fieldwork, I found that various forms in the education system—physicality, curriculum, pedagogy, language—produced and constructed “students with disabilities” simply through the institution itself (Schuelka, 2018b). Re-looking at this project through the lens of the CESA, it is easy to see that disability and student difference was being enacted across a wide variety of community groupings and relationships. In terms of the attributes of education, Bhutan was working toward increasing access, but not enough on the quality of the education experience and adjusting the system to accommodate diversity in the classroom.

More recent work on educational values in Bhutan—Toyota Foundation, 2018–2022—uncovered significant misalignments of educational values across various elements within the complex system. This is where the EVED framework originated. To isolate just inclusivity as an educational value, we observed that curriculum was narrow, fixed, and oversubscribed. Teachers were forced to maintain certain modes of pedagogy—didactic and teacher-centered—in order to simply get through the required curriculum. The education system in Bhutan is examination-focused, with summative exams at the end of every grade and major exams at grade 10 and grade 12. At each examination point, student failure means that they do not progress. While teachers indicated to us in focus groups that they wanted to introduce variety into their teaching, it simply was not possible given the rigid curriculum and examination structure. This was counterproductive to the value of inclusion in the classroom, as there was no space for accommodation, flexibility, and adaptation. Educational material availability is a significant challenge in Bhutan as well, with a heavy reliance on textbooks distributed centrally.

Surrounding the education practices in schools is also the larger socio-cultural and economic context of a rapidly changing Bhutan. In what seems counterintuitive, the largest group of unemployed and underemployed persons with Bhutan are actually school graduates (NSB, 2018). This is an indicator that the education system is misaligned with the supply needs and availability demands within the economy. While access to school was a given as a human right, there is a diminishing sense that education provides enough utility to greater society. Within the CESA, this highlights the interconnectedness of the educational attributes dimension, as well as how they can be connected and yet misaligned. This misalignment can also further erode the value of inclusion in the education system as it lessens the incentives for education to gain social mobility. In other words, by performing a personal cost-benefit analysis an individual may decide that going to school does not actually give them much.

The case of Bhutan makes an important point for inclusive education in that the value of inclusion and diversity in education needs to be aligned with enough elements in a complex system in order to make a difference. Simply providing the legal and policy means of “access” are not enough to reform a system. A singular focus only on teachers and their pedagogical practices will not reform a system that has not made other systemic changes to curriculum, or the structure of the school day, or the physical space of classrooms, or the availability of resources, and so on. In Bhutan, as in all other countries, increasing the value of inclusion and diversity in education means working with all elements of the complex system simultaneously. This, of course, is not the easy path forward, but I would argue that it is the most effective.

The (complex) path forward

In summary of the above sections, I argued that reform in complex educational systems involves an alignment of elements across the system. Those that have advocated for greater inclusivity and diversity as an educational value have often pulled one lever in a system without accounting for the other levers that either affect, or are affected by, the first lever. The first suggestion I make through this article is that an important first step in education reform is to recognize the complexity of the education system itself.

The second suggestion I make through this article is that once you recognize the complexity of the system, you can begin to understand and analyze it. In this article, I have provided two tools in which to facilitate this: Complex Educational Systems Analysis (CESA) and its application, the Educational Values Evaluation and Design (EVED) Framework. However, I do not

propose these as yet another tool to identify “barriers to inclusive education,” or whatever other phenomenon you are studying. The whole reason that “Evaluation and Design” are in the EVED Framework is that I argue that through evaluation we can provide better design to achieve educational value goals. Like the Ishikawa diagram on which it is based, the intention of the EVED Framework is to intentionally work toward solutions by recognizing that interconnected elements inform the entire process.

For example, in the case of Bhutan, our most significant finding was that poor curriculum was pulling on both teachers and their pedagogical practices in that it was not incentivizing teachers to be more inclusive in their classrooms and encouraged complacency in terms of engaging with students. It can also be argued that old-fashioned pedagogical modes of delivery—namely the kinds of teacher-centered practices imported from India—have entrenched themselves in Bhutanese education and shaped the curriculum around that preferred mode of delivery. For the teachers, their identities mostly revolved around content delivery and student academic achievement. I strongly aver that it is not teacher attitudes that are a barrier to inclusive education, but it is in how other elements in a complex system incentivize or disincentivize teachers from reconceptualizing their role and their identity in a different way. If I was an education policy maker in Bhutan—which I am not—and I wanted to make the education system more inclusive, I would focus on how curriculum affected the other elements, and in how the other elements affected curriculum. Of course, the policy makers need to want to make the education system more inclusive, but that is a whole different issue.

The third suggestion I make through this article is that education reform is slow, often nonlinear, and uneven. This is the chaos of a complex system at work. However, just as in nature, sometimes there are moments of synchrony (Strogatz, 2003) when elements move together in a complex system. If elements move together, sustainable reforms can occur, but it involves deep and longitudinal work in a system that is fairly unglamorous. This is the problem with education reform—particularly as perpetuated by NGOs and private foundations—in that often it is more lucrative to an organization to strive for one, big, seductive reform that claims to be the panacea for all of the education systems’ ills. As complexity theory tells us, it is never just about one thing, and a new element in the system will have an untold number of effects across all other elements.

Finally, I suggest that reform in complex educational systems needs to pay greater attention to the underlying purpose of education and the values the education system wishes to inculcate. As I said above, these can be purposefully designed if a greater recognition of the complexity of the system is made. It is important to ask teleological questions of education, and not to assume that education has always had the purpose of being in human history—which it most certainly has not. Fortunately, education is a human-constructed system and it is certainly within our power to shape it any way we want to. Unfortunately, we have made the education system extraordinarily complex.

Glossary

Capacity-building The process of building the capacity of mainstream schools to meet the needs of all learners, rather than distributing additional resources for learners with additional support needs. This process involves increasing the knowledge and skills of all education professionals (i.e., leaders, teachers and specialist staff), as well as enhancing the collaborative practices within schools and across the local communities, with the ultimate aim of transforming learning and teaching and improving learner outcomes ([European Agency, 2014](#))

Cross-sectoral co-operation Cross-sectoral cooperation means that multiple stakeholders from outside the education sector are engaged to create an alliance or network of different individuals, organizations and sectors with diverse perspectives and resources to address complex challenges more effectively ([Cross-sectoral co-operation](#)).

Financing Education financing: ... refers to governmental and organizational processes by which revenues are generated (through taxation, tuition, fees, and philanthropy), distributed, and expended for the operational and capital support of formal schooling ([Oxford Bibliographies, no date](#))

Financing system A financial system consists of institutional units and markets that interact, typically in a complex manner, for the purpose of mobilizing funds for investment, and providing facilities, including payment systems, for the financing of commercial activity ([OECD, 2005](#); Glossary of Statistical terms)

Funding Funding refers to “money provided, especially by an organization or government, for a particular purpose” ([Oxford Dictionaries, no date](#)). Within an educational context, financing is most often the responsibility of different ministries and/or sectors and funding is therefore provided in different ways

Governance “The exercise of political, economic and administrative authority” (p. 275). Governance refers to “the way that organizations or countries are managed at the highest level, and the systems for doing this” ([Cambridge Dictionary, no date](#)). It also refers to measures ensuring effective planning intending to develop appropriate and sustainable provision. The governance of system-level budgeting deals with: the role and responsibilities of the different actors involved in the budget process; the distribution of authority, particularly between the ministry of finance, line ministries and agencies; and the

institutional arrangements and relationships between these actors. Governance also touches upon the question of distribution of power between regional and central government, as well between the executive and legislature (Fakharzadeh)

Inclusive education system UNESCO stresses the need for a systemic, capacity-building approach to developing inclusive education systems: Implementing changes effectively and monitoring them for impact, recognizing that building inclusion and equity in education is an on-going process, rather than a one-time effort (UNESCO, 2017, p. 13). All European countries are committed to working toward ensuring more inclusive education systems. They do so in different ways, depending on their past and current contexts and histories. Inclusive education systems are seen as a vital component within the wider aspiration of more socially inclusive societies that all countries align themselves with, both ethically and politically. The ultimate vision for inclusive education systems is to ensure that all learners of any age are provided with meaningful, high-quality educational opportunities in their local community, alongside their friends and peers (European Agency, 2015, p. 1)

Input funding Input funding (also sometimes referred to as “needs based funding”; see Meijer, 1999; European Agency, 2016a) is when the funding is based, for example, on the identified need of each of the destination levels, such as the number of learners with special needs in a school, municipality or region. Inputs may also be defined in terms of referral rates, low achievement scores, the number of disadvantaged learners and so on. The key point is that funding is based on the (expressed or measured) needs (European Agency, 2018a)

Policy framework A policy framework brings together policies/policy elements that set out the requirements and processes for reaching policy goals in line with national/organizational values and principles. A policy framework outlines roles and responsibilities for policy development, stakeholder engagement, implementation, dissemination, monitoring/evaluation, governance and operational processes (European Agency working definition)

Throughput or discretionary funding Throughput, or discretionary, funding is based on the functions or tasks that have to be undertaken or developed. It is not based on needs, but rather on the services provided by a school, municipality or region. Finances are allocated on the condition that particular services will be developed or maintained. Schools, municipalities or regions are equally treated: funds are based on total enrollment or on other population indicators. Of course, certain output conditions can be included in this model, but funding itself is not based on outputs (or inputs) (Meijer, 1999; European Agency, 2018a)

Introduction

The UNESCO Policy Guidelines (2009) describe inclusive education as a process that strengthens the capacity of the education system to reach out to all learners. The policy guidelines, as well as the 2017 UNESCO Guide for ensuring inclusion and equity in education, argue that an inclusive education system can only be created if all schools are supported to be more effective at educating all children in their communities. This line of thinking underpins the work of the European Agency for Special Needs and Inclusive Education (European Agency) with 31 European countries, covering 35 jurisdictions. European Agency work is guided by the overarching principle that inclusion and equity should provide the foundation of *all* educational policies and practices.

The position of the European Agency is that inclusive education is a human-rights issue, and also a part of a wider societal process working toward more inclusive and equitable societies as argued by international organizations (such as UNESCO, 2017 and 2020b), as well as European Union organizations (Council of the European Union, 2018a,b; Council of Europe Commissioner for Human Rights, 2017; European Union Agency for Fundamental Rights, 2020; European Commission, 2020).

The position statement of the European Agency argues that: “The ultimate vision for inclusive education systems is to ensure that all learners of any age are provided with meaningful, high-quality educational opportunities in their local community, alongside their friends and peers” (European Agency, 2015, p. 1). This position has to be recognized as a vision for all countries across Europe and globally.

Ydo (2020) links issues raised in work conducted by UNESCO (2020a) with challenges for achieving the vision of inclusive education highlighted in the Global Education monitoring Report Inclusion and Education: All Means All (2020b). These challenges include: differing understandings of the word inclusion; a lack of teacher support; absence of data on those excluded from education; inappropriate infrastructure; persistence of parallel systems and special schools; lack of political will and community support; untargeted finance; uncoordinated governance; multiple but inconsistent laws; and policies that are not being followed through (Ydo, 2020, p. 100).

Such challenges mean that, rather than “achieving” a fully inclusive system, countries have a range of policies that can be considered inclusive or exclusionary to differing degrees (European Agency, 2020; UNESCO, 2020b) and Ainscow (2020) stresses the importance of ensuring contextually sensitive change policy development work.

Financing impacts upon all of these challenges. European Agency work with its member countries over more than two decades (1999, 2016a,b, 2018a,c) has clearly shown that the strategies and mechanisms used to finance education systems are possibly the single most critical lever in making those systems more inclusive. The crucial role of financing systems in developments toward inclusive education have been identified by researchers (Slee, 2018; Meijer and Watkins, 2019; Ebersold et al., 2020), as well as international organizations (UNICEF, 2015; UNESCO, 2017, 2020b).

Financing refers to the process of providing different types of funds and resources to ensure the provision of educational opportunities for all children, learners and adults (OECD, 2017a; European Agency, 2018a). Importantly, financing also relates to the different possibilities and degrees of freedom within different parts of the education systems to use available funds and resources in flexible and innovative ways to meet all learners' needs (Meijer and Watkins, 2019; European Agency, 2016a).

However, financing inclusive education involves far more than "spending" issues within the general education system (European Agency, 2018a). Allocating sufficient money is essential, but effective financing systems also require resourcing mechanisms and strategies that incorporate:

- Quality assurance processes designed to achieve, maintain and enhance quality in inclusive education. Such procedures should examine how educational organizations account for their activities, accept responsibility for them and share information on their results openly and transparently;
- Governance mechanisms that ensure accountability, transparency and responsiveness of the system for inclusive education;
- System capacity building strategies for developing and strengthening professionals' attitudes, skills and abilities. Such strategies should consider the support and resources that educational organizations and communities require to develop the necessary working procedures for inclusive education (European Agency, 2018b).

Slee (2011) argues that developments toward inclusive education must include a *practical understanding* of what attitudes, processes and structures are involved in exclusionary policies and practices. A further critical factor is whether *inclusion* or *exclusion* is the essential focus of financing within education systems (Ebersold et al., 2020).

The starting point for this paper is that efficient financing mechanisms aim to enable schools to provide flexible learning opportunities for all learners and support teachers to meet diverse educational needs through innovative teaching practices (Ebersold and Meijer, 2016; European Agency, 2016b,c, 2018c). Efficient and effective financing mechanisms are in effect geared toward *paying for inclusion*.

By contrast, inefficient financing mechanisms may act as a driver for maintaining or even promoting education approaches that reinforce the labeling of some learners and their placement in different types of provision, including separate settings such as special classes or special schools. Financial incentives maybe be "hidden in legislation" (Meijer, 1999) and departments from different ministries may use financing policies with conflicting incentives. It is important to reveal and analyze the ways in which financial incentives or disincentives act as a support for, or a barrier to, inclusive education. It is also important to see financing from a broader perspective than ministries of education (European Agency, 2018a,c).

These possible inefficient and ineffective financing mechanisms, geared toward *paying for exclusion*, are also examined within this paper.

The following sections aim to explore what paying for inclusion and exclusion means in relation to the development, implementation and outcomes of inclusive education policy frameworks. Two main issues are considered:

- How financing inclusive education needs to go beyond financing general education; and
- The challenges of moving from financing special needs education to financing inclusive education for all learners.

Shifting the focus of financing within education systems

How general education systems are financed has been covered extensively—for example, in research at the international level by OECD (2017a), UNICEF (2015), UNESCO (2020b). Across European countries, the work of the European Commission (EACEA/Eurydice, 2014) demonstrates " ... an overall picture of great variety across Europe with respect to funding systems. These systems have developed over many decades to meet the needs of individuals, wider society and the economy. The changing priorities of education systems have also shaped the way in which funding systems have developed" (p. 8).

Funding specifically dedicated to general education in many European countries encompasses frameworks—services, structures and organizations—for supporting the individual needs of learners, or the collective needs of an entire school community, municipality or region (EACEA/Eurydice, 2014; European Agency 2016a, 2018a,c). These resourcing frameworks often focus upon providing technical support or offering materials for the planning and implementation of local, regional or national support services. They may also offer advice and consultancy both at the system and at the individual learner level, as well as providing in-service training opportunities.

The European Commission (2014) argues that two specific factors within countries' systems result in challenges to identifying and understanding the funding methods and criteria that education authorities use when allocating resources within the general education system:

- The level of autonomy given to regional and/or local authorities and schools when making funding decisions; and
- The complexity of funding formulas and variables or indicators used for allocating funds and resources.

While this demonstrates the complex nature of general educational financing, the financing of inclusive education systems, involving additional elements becomes even more complex (European Agency, 2016a,b). These elements are discussed in the following sections.

Financing inclusive education goes beyond financing general education

In most European countries, the financing of inclusive education involves additional elements of multi-level and multi-stakeholder funding and resourcing that covers mainstream education and different forms of specialist provision (Ebersold, 2008, 2016; European Agency, 2016a,b).

Financing provided by a range of stakeholders

Within most countries' systems, education involves financing from a range of sources, including but not limited to ministries of education and finance (Eurydice, 2014). The wider demands of inclusive education mean that increasingly, financing from other ministries—such as those responsible for health, social, labor and ICT issues is required as well as resources from non-governmental organizations and the private sector (UNESCO, 2020b; European Agency, 2016a,b, 2018c).

Funding from non-educational sources may therefore cover health and welfare issues, or consist of financial support for learners and/or their families to cover costs linked to school materials, meals, transport or additional services and technology.

Financing “non-educational” aspects of provision

Systems for inclusive education need to specifically resource non-educational aspects that ensure all learners access to high-quality inclusive education. An example of a non-educational aspect is accessibility as defined by Article 9 of the UNCRPD (United Nations, 2006). This may involve physical access to school premises, accessibility of transport opportunities, as well as access to extra-curricular activities for all learners.

Financing different sectors within the education system

Within all European countries, resourcing of inclusive education may include special settings—either separate classes, units or schools—as a feature of provision within education systems (European Agency, 2019). All countries embed funding for these settings in their resource allocation frameworks and special schools and classes are part of a continuum of service provision offering educational opportunities for learners who experience the greatest challenges in their learning. In some countries, special settings act as resource centers that provide additional support for individual learners and/or enable mainstream schools and teachers to provide inclusive education. In others, they provide education to learners whose special needs and/or disabilities require educational approaches addressing pedagogical, psychological and rehabilitation issues (European Agency, 2019).

From financing special needs education to financing inclusive education for all learners

Across the globe, policy understandings and conceptualizations of inclusive education have grown out of discussions surrounding specialist segregated provision, integration and mainstreaming (Watkins, 2017; Ramberg and Watkins, 2020). Thinking around inclusive education based on a human rights perspective (Donnelly, 2010; Operti et al., 2014) has developed from a focus on the rights of some learners to access different sectors and opportunities within a country's education system toward a focus upon systemic approaches geared toward raising the achievements of all learners (Florian et al., 2017), as well as the overall system (European Agency, 2015; Watkins, 2017; Ramberg and Watkins, 2020).

Within many policy contexts, the understanding of the concepts behind policies for inclusive education have shifted from being mainly associated with learners with special educational needs and/or disabilities and in particular their educational placement, to meeting the needs of a far wider range of learners who may be vulnerable to exclusion. This shift in thinking is also increasingly evident—and necessary—in the shift in emphasis in financing models, mechanisms and strategies (Ebersold et al., 2020).

Changes and developments in policy for inclusive education need to be mirrored by a change in financing policies and mechanisms in order to involve a broad range of stakeholders, within and outside of education. A move from financing special needs education toward financing inclusive education does not necessarily mean spending more, or less, but it does mean using financial resources in different ways for different purposes (European Agency, 2018a,c). The financing of inclusive education can be contrasted with financing special needs education in a number of important ways. These are explored in the next sections.

Financing special needs education

The essential aim of special needs education is to provide additional, specialist support for learners who have diverse (and possible multiple) social, intellectual or physical needs. Special needs education is usually framed by a medical approach to disability and/or special educational needs focusing on learners' inabilities and/or deficiencies rather than on weaknesses within the educational system (Ebersold, 2008; Meijer and Watkins, 2019). Legislation may include defined categories of special educational needs—that is “within learner factors—that are often guided by policies that are administered by different ministries (e.g., health or welfare) or from within special services of the ministry of education (European Agency, 2016a). Special needs education emphasizes the idea of different possible placements in education: enrollment may be in special, separate settings, such as special classes, special schools and special residential schools or institutions, as well as in mainstream settings. It also raises the

possibility of educational provision outside of school settings: in learners' homes, in hospitals, or in other forms of alternative provision.

Financing of special needs education has often been built around locating "problems" within the learner and then allocating resources to provide additional provision to compensate for those problems in order to fit the learner into existing educational arrangements. This process is often associated with a formal assessment of learners' abilities, linked with predefined resourcing strategies, such as funding coefficients (European Agency, 2016a, 2018a). This approach can be characterized as an *input* model of funding—sometimes called needs-based funding. Learners' needs are identified and assessed and a form of official decision or statement is issued before an allocation of additional funding is made (Meijer, 1999, 2003; Meijer and Watkins, 2019). In effect, the higher the level of needs identified, the more funds are made available.

Input-based resource allocation mechanisms can be seen to have a number of potentially negative consequences, for individual learners, as well as the overall education system:

1. Input funding models provide incentives for identifying learners as having some form of special educational need as they then attract additional funds (Meijer, 1999). Such models may increase strategic behavior that leads to a rise in the identification and labeling of learners as having special educational needs.
2. Enrollment in special settings is also encouraged when funding mechanisms lead stakeholders from mainstream settings to regard the enrollment of learners with different learning profiles as a financial burden for them. They may also believe that experts from specialist provision are more able to cope with these learners (Meijer, 1999; Parrish, 2001, 2014).
3. Input funding mechanisms can also be seen to actively encourage mainstream school stakeholders to "outsource" the responsibility for meeting some learners' needs to other professionals, or other forms of dedicated, specialist provision. Outsourcing may result in learners being enrolled in special classes or schools, where such provision is specifically dedicated to meeting a type of need or supporting a particular disability (Ebersold and Meijer, 2016).
4. Crucially, such outsourcing can limit the perceived need, or actual opportunities for any form of development of the mainstream school's ability to more effectively meet diverse learning needs in practice (Ebersold et al., 2020).

Financing inclusive education systems

In contrast to special needs education, inclusive education aims to provide resources that support the adaptation of the education system and environment to the needs of all learners. It involves the identification and removal of barriers to high quality education for all learners by funding and resourcing the development of innovative teaching approaches and practice (Ainscow et al., 2012; OECD, 1999, 2004, 2012; European Agency, 2016b; Parrish, 2014).

The goal of an inclusive education system is to support all learners and provide effectively for each of them. An education system cannot be considered to be of high quality if some learners are out of school or not fully participating in learning opportunities available to their peers (UNESCO, 2009, 2017, 2020a,b).

Financing of inclusive education systems must therefore be guided by Slee's (2018) goal of dismantling "... barriers to education for all children so that they have access to, are present and participate in and achieve optimal academic and social outcomes from school" (p. 2). Funding and resourcing strategies must address the multidimensional aspects of presence, placement, participation and achievement for all learners (Ainscow, 2016; Norwich, 2013), not just those with some form of label or official decision of need.

Financing of inclusive education necessarily involves the provision of funding and resources to support changes in educational culture, as well as in teaching and support practices. Financing inclusive education requires moving away from a "one-size-fits-all" education and funding model, toward a tailored approach that aims to increase the ability of both the system and of individual schools to respond to learners' diverse needs without the need to allocate funds by categorizing and labeling learners.

Such additional funding may enable schools to provide different forms of intensified support for some learners who are at risk of exclusion from learning opportunities. These approaches have been termed as *throughput funding models* (Meijer, 1999; Ebersold and Meijer, 2016; European Agency, 2016b). The European Commission (2014) suggests such approaches can be characterized by the discretionary determination of resources, where the responsible funding authority has discretion in determining the resources to be allocated, based on an understanding of case by case, local resource needs.

Throughput funding mechanisms can have a number of benefits for both learners and the education system:

1. Crucially, throughput, or discretionary resource allocation approaches go some way to addressing equity issues that arise as a result of funding strategies that reinforce disparities between regions or geographical areas.
2. Throughput, or discretionary resource allocation focuses on services that enable schools to provide intensified support to learners who are facing difficulties. Such approaches to funding do not connect eligibility for additional provision or support with an official decision or labeling process, but with a needs identification process that is implemented at the school level. These funding approaches aim at reducing attainment gaps between individual or groups of learners who are at risk of exclusion. For example, funding and eligibility for support without having an official decision of SEN may be dedicated to specific programs meant for learners from disadvantaged backgrounds and/or for learners from a migrant background (European Agency, 2016a).

3. While some forms of specific (input-based) additional funding may be required to support a small number of learners in need of the most intensive support, more flexible (throughput) resource allocation methods can help schools to develop inclusive learning environments that work toward the *prevention* of learning problems by being universally accessible and adaptable to each learner's diverse needs (UNICEF, 2015; European Agency, 2016a, 2018a).

Despite the points raised about different funding approaches, both approaches are needed. However, decisions regarding funding should be made as late as possible within the financing process and be taken at the level closest to the learner involved; also involving teachers and families. Input-based funding decisions to support school needs should be taken at the level of local or regional authorities (Meijer, 1999, 2003) to ensure awareness of the local context.

The following section focuses on how financing mechanisms can support education policies that aim to take a prevention approach.

Moving toward financing that takes a preventative policy approach

Financing inclusive education involves critical actions that are closely related to a shift in funding from special needs education—in particular segregated settings schools or separate classes—to inclusive education in mainstream schools. The implementation of these actions may require a fundamental shift in thinking and understanding in terms of the *intentions underpinning* policy initiatives and strategies.

European Union work (European Commission, 2020) emphasizes the importance of a balance of policy approaches to reflect broader thinking about quality education that meets diverse learner needs.

The 2020 Eurydice report on equity in school education considers system level factors including influences and inter-relationships in 42 European countries' education systems. Key factors impacting upon equity include:

- Stratification (grouping learners based on ability and/or interests);
- Standardization (application of the same quality standards);
- Support measures (to promote equity and mitigate disadvantage); and
- Diversity in types of schools (resulting in an increase in academic segregation and decrease equity).

The report highlights differences in inclusive, equitable learning opportunities occur due to governance and funding mechanisms, as well as curriculum and structural features (e.g., types of school).

The European Education Area (EEA) targets (European Commission, 2020) to reduce low achievement and increase secondary education attainment build on four pillars:

- Monitoring (allowing tracking/targeted action);
- Prevention (in particular for groups at risk);
- Early intervention (for learners showing difficulties); and
- Compensation (for those who have already had poor results/need a second chance).

The concepts of Prevention-Intervention-Compensation policy approaches (set out in Council recommendation June 28, 2011 on policies to reduce Early School Leaving—OJ C 191 July 1, 2011) have been used by the European Agency (2018d) to assess the current policy situation in European countries and make recommendations about policy actions that enable progress by increasing preventative approaches.

Within its work with member countries, the following operational definitions have been agreed:

- *Prevention*: policies that aim at *avoiding* educational exclusion and longer-term social exclusion (for example, anti-discrimination legislation promoting a rights approach, avoidance of disabling policies that lead to gaps in provision, lack of qualifications, etc.).
- *Intervention*: policies *supporting* the effective implementation of inclusive education for example, the existence of clear policies leading to high-quality flexible support systems for mainstream education).
- *Compensation*: policies *addressing* existing difficulties that will lead to educational exclusion if they are not implemented (for example, separate segregated educational programs or provision, support for failing schools, second-chance educational programs) (European Agency, 2018d).

The goals of inclusive education (e.g., to remove barriers to learning, support all learners and provide effectively for each of them) are most effectively met when policy and practice *prevents* different forms of educational exclusion before they happen; *intervenes* to ensure that good quality inclusive education is available for all learners at all times; *compensates* with specific actions and provision when prevention and intervention are not enough to ensure learners' needs are adequately met in inclusive settings (European Agency, 2018d; European Agency, in press).

In the following section, the use of this approach in considering financing policies, strategies and mechanisms and determining the overall level of inclusiveness of countries education systems is discussed.

Inclusive financing of whole education systems

Inclusive education is a multi-faceted process requiring inputs from different groups, organizations and sectors with different professional identities and experiences. The effective implementation of inclusive education systems requires synergies among stakeholders that are promoted by clear financing mechanisms that support a move toward a prevention policy approach. Such policy mechanisms aim to fund inclusion and avoid funding exclusion (European Agency, 2018c).

Financing of inclusive education systems may or may not be framed as a single “stand-alone” policy. In many country contexts, the goals, objectives and strategies for the implementation of financing are embedded within other educational policies and actions (European Agency, 2016a, 2018c).

It is therefore important that a preventative financing approach is seen as operating at the interface between several different educational policy areas, as shown in Fig. 1 below.

All of these policy areas need to be considered in order to address the challenges of compensatory financing approaches that essentially pay for exclusion and move toward preventative financing approaches that aim to pay for inclusion.

Within a comprehensive policy framework for financing inclusive education systems, financing is not an end in itself. Rather, it is a tool for promoting and ensuring inclusive education systems that provide quality educational opportunities for all learners (European Agency, 2018a). Three principles relating to learners’ rights to inclusive education underpin the development and implementation of any preventative financing policies, frameworks and strategies that aim to pay for inclusion and not exclusion:

1. **Efficiency**, in terms of improving the cost-benefit relationships within systems;
2. **Effectiveness**, in terms of considering educational outcomes for learners, as well as other stakeholders in the system; and
3. **Equity**, in terms of ensuring equitable educational opportunities through respecting diversity and eliminating discrimination.

European Agency thematic project work with its member countries during 2014–2018 has highlighted that efficient cost-effective inclusive education systems can be directly connected with four underpinning resourcing issues and related critical resourcing factors that determine equitable, efficient cost-effective inclusive education. The factors are, in turn, linked to key funding drivers that are considered essential for implementing effective financing policies (European Agency, 2018a,c). Together, the issues, factors and drivers can be seen as a framework for inclusive financing of whole education systems.

Fig. 1 Financing at the interface with other policy areas for inclusive education systems.

The four sections below describe the main cross-sectoral issues to be considered within preventative financing that aims to pay for inclusion.

Each section begins by presenting the *current challenges* to be addressed in relation to funding exclusion and then the *main goal* for financing that aims to take a prevention approach. The tables then describe the *critical resourcing factors* and *key drivers* associated with a more preventative approach, targeted toward funding inclusion. A consideration of these factors and key drivers aims to address the current challenges and support the development of a more preventative financing policy approach.

Ensuring learners are effectively included in appropriate educational opportunities

Current challenge: to prevent exclusionary strategies that deny learners their rights to and within education. These strategies may involve excluding learners from education, from participation in inclusive education, or from engagement in meaningful learning opportunities. Such strategies are often linked to the over-identification of learners who require an official decision of special educational needs and, potentially, to increasing expenditure related to segregation and/or individual learner support and provision.

Main goal: ensure all financing strategies are targeted toward educational inclusion, not exclusion.

<i>Critical resourcing factors</i>	<i>Key drivers</i>
There is cross-sectoral policy commitment to the right to inclusive education for all learners	The financial commitment toward inclusive education is identified and specified. The financial commitment toward high quality outcomes for all system stakeholders is clearly stated. The commitment toward the development of adequately resourced, diverse support measures for learners and stakeholders is clearly stated.
All resourcing mechanisms support the implementation of inclusive education within local contexts using a community-based approach	The resources required to implement inclusive education as a key task and area of responsibility at all decision-making levels are described. The resources required for schools to implement their social responsibility toward inclusive education are described. The specific and targeted resources required for schools to meet the full range of learners' diverse needs are described.
All resourcing mechanisms support school development and capacity-building for inclusive education	The implementation of a sustainable balance between whole-school (throughput) funding approaches and needs-based (input) funding approaches is outlined. The resources required for developing inclusive learning communities are identified and described.

Promoting a school-development approach for inclusive education

Current challenge: to avoid financing mechanisms that act as a disincentive for inclusive education. Flexible financing systems must ensure a school-development approach that builds learning communities through the development of innovative and flexible forms of teaching that combine high performance and equity.

Main goal: support school teams to take responsibility for meeting all learners' needs.

<i>Critical resourcing factors</i>	<i>Key drivers</i>
There are incentives for the provision of supportive learning environments in all schools	The targeted financial support for schools and learners at risk of under-achievement is specified. The provision of resources for effective working within learning networks is described.
School autonomy in taking responsibility for meeting all learners' needs is promoted and supported	The degrees of flexibility in the use of public funding are outlined. The degrees of schools' organizational flexibility over curricula, assessment and resource allocation are clearly stated.
The implementation of inclusive education is embedded within quality assurance mechanisms at school level	The resources to support schools to implement distributed leadership are outlined. The resourcing mechanisms necessary for supportive and innovative learning environments are described.

Providing innovative and flexible learning environments

Current challenge: to avoid funding mechanisms that act as an incentive for segregation and exclusion when teaching and support in mainstream settings are seen as inadequate for meeting learners' needs. This may lead stakeholders to perceive that special settings (i.e., separate schools and classes) provide better educational support for some learners.

Main message: effective funding mechanisms are an incentive to inclusive education when they promote capacity-building that empowers stakeholders to develop innovative and flexible mainstream learning environments for all learners.

<i>Critical resourcing factors</i>	<i>Key drivers</i>
All resourcing and support systems promote capacity-building strategies at different system levels	The resources required for local-level community-based capacity-building strategies are outlined. The resources required for school-level capacity-building strategies are outlined. The specific and targeted resources required for capacity-building strategies around the provision of external support for learners' needs are outlined.
Special settings are effectively supported to act as a resource for mainstream settings	The incentives for special settings to act as resource centers supporting the mainstream sector are specified. The resources required to ensure inclusive education issues are embedded within all pre- and in-service training of specialists working in separate, specialist settings are specified.
Inclusive education is embedded within all professional development opportunities	The resources required to embed inclusive education in all teacher training/education opportunities are identified and described. The resources required to promote leadership capabilities for developing inclusive schools are identified and described. The resources required to include parents in training/development opportunities are identified and described.

Ensuring transparent and accountable systems of inclusive education

Current challenge: to avoid resource allocation mechanisms that promote the labeling of learners as these are not cost-efficient or equitable in the long term. Rather, areas for development within educational support and provision should be identified. Ineffective cross-sectoral collaboration (i.e., with health and social protection services) can result in duplication of services and inconsistent approaches.

Main message: funding and resourcing systems that balance efficiency, effectiveness and equity issues are clearly linked to regulatory frameworks focusing on overall system governance, accountability and improvement.

<i>Critical resourcing factors</i>	<i>Key drivers</i>
There are multi-level and multi-stakeholder governance strategies that promote effectively co-ordinated systems for inclusive education	The governance and resourcing mechanisms necessary to promote and guide the work of networks of schools are outlined. The governance and resourcing mechanisms necessary to promote and guide local-level, horizontal collaboration, resource allocation and decision-making within and across local communities are outlined. The governance and resourcing mechanisms required to ensure an effective professional inter-disciplinary support framework are described. The resources required to ensure there is an effective and efficient inter-ministerial governance framework are identified and described.
A move from procedural control mechanisms to systems where key stakeholders are clearly held accountable for inclusive education is supported and implemented	The connection between the funding of inclusive education and evidence-based resource-planning is described. The resources required to implement monitoring mechanisms that link schools' use of resources to evidence of progress toward efficiency and equity goals are identified and outlined. The funding of inclusive education is clearly connected to and mapped against a framework of system goals and indicators for inclusive education. The resources required to embed inclusive education issues within all reporting and dissemination mechanisms are outlined.
The goals and objectives for inclusive education underpin the quality assurance framework	The resourcing mechanisms required to ensure inclusive education issues are embedded within all quality assurance systems are identified and outlined. The resources required to develop and implement inclusive education quality assurance tools and mechanisms are identified and outlined.

Reinforcing the need for prevention-based policy approaches

The COVID-19 pandemic has focused attention on the inadequacy of many of the traditional structures and processes in education systems—including how these structures and processes are financed. Many of these are the very same structures and processes that need to be transformed in order to make education systems more inclusive and ensure that all learners, in particular those from disadvantaged groups are included. The [United Nations \(2020\)](#) estimated that 23.8 million additional children and youth are at risk of dropping out of school due to the pandemic's economic impact.

This economic impact is likely to affect the funding allocated to education (World Bank, 2020) and will increase the need to consider more efficient and effective ways to increase quality of education for all learners within the system. For many countries an examination of the effectiveness and efficiency of system processes is considered overdue. According to OECD (2019) there has been no real overall improvement in learning outcomes for students in OECD countries even though expenditure on education has risen by more than 15% in the past decade.

Pursuing the economic argument, Di Pietro et al. (2020) note that the learning loss suffered by students during the COVID-19 crisis "... will translate into a reduction of available human capital, with negative effects on productivity growth, innovation and employment, including future lower earnings for the student cohorts directly affected by the lockdown" (p. 5). They stress that these numbers should be considered by policymakers when making decisions about investment to mitigate the negative effects of COVID-19 on education.

Overall, an important lesson from the pandemic is that countries need to "... [build] resilient education systems for equitable and sustainable development" in order to "reimagine education and accelerate change in teaching and learning" (United Nations, 2020, p. 3). This could be helped by funding prevention policy approaches, in particular attending to the needs of learners experiencing disadvantage to ensure early intervention. Sahlberg (2020) notes that such approaches can help children "catch up" during teaching and learning and effectively reduce performance gaps. Some compensatory policies will also be needed at least in the shorter term with funding for marginalized learners who have been left behind.

This section will set out some factors to consider in planning and funding responses to COVID-19 to ensure that the needs of all learners are taken into account and exclusionary mechanisms avoided. World Bank (2020) highlights that in all countries, the pandemic places a spotlight on the need to use resources as efficiently and as equitably as possible, addressing factors such as uneven distribution of teachers, fiscal transfer formulas that fail to take account of differences in student populations and weaknesses in public procurement systems.

The underpinning resourcing issues set out above are used here to consider the benefits of a move toward a more inclusive system as countries recover from the pandemic and avoid the risk that in the absence of appropriate policy measures, the short-term inequality caused by COVID-19 may persist or even grow over time, leading to more economic disparity in the future (Di Pietro et al., 2020).

Including all learners in appropriate educational opportunities

Poverty inevitably impacts on children's education. Van Lacker and Parolin (2020) note that food insecurity and housing instability impact on physical health and mental well-being—both associated with low educational attainment.

Dorn et al. (2020) point out that in many communities, schools are also the hub for supports such as school meals, mental-health counseling, and childcare. In many homes, especially for low-income families, students lack access to the internet, devices, and a dedicated, quiet place to study (p. 2). Lack of heating and of outdoor spaces and inability to speak the majority national language all compound the difficulties of home schooling. Further, for some children, schools provide protection for those who do not feel safe at home. Sectors need to work together, coordinated across all system levels to fund the development of resilient community services that support children in a more holistic way.

Such an approach to education can also better address learners' social and emotional as well as learning needs (Cerna, 2020). Cerna notes that: "Considerable joint efforts by school leaders, teachers, parents, students, educational and health care professionals, and communities will be needed to (re-) create schools as safe, supportive and inclusive places for all students". Funding such developments will support prevention policy approaches, reducing more costly exclusion from schools and the need for compensation in the longer term.

OECD (2020) state that, if it is true that schools account for approximately one-third of variability in student test results, then the best opportunities for improving the quality of educational outcomes lie in developing system level conditions that impact on lives of children. Key here will be a reduction in child poverty. The World Bank (2020) notes that COVID 19 will slow progress on poverty reduction and in some cases reverse previous gains. This could be compounded by a reduction in support from NGOs and charities who may also be affected by reduced funds and adds further weight to the need for cross sector collaborative working to use resources in the most efficient way to support learners and families in local communities (UNESCO, 2020b).

The role of parents also becomes more critical, in particular for younger learners and others with additional support needs who may find online learning a challenge. Di Pietro et al. (2020) suggest that parents should be involved in the design and implementation of learning strategies as they need to fully understand what is taught and why as well as the emotional challenges of online learning. Effective communication between parents, teachers, and the school will be essential to the success of online learning strategy with a range of benefits for every community.

Underpinning inclusive education by a school-development approach

OECD (2020) highlight the need for education systems that are built on trust-based professionalism. This, together with greater flexibility to allow schools the autonomy to adapt the curriculum to local needs and strengths and teachers to adjust teaching and learning to changing circumstances, builds greater resilience to cope in times of crisis. Skilled teachers who really know their learners can make the most of the available flexibility in schools/classroom organization and in curriculum to provide appropriate learning opportunities for everyone (European Agency, 2018e).

Dorn et al. (2020) recognize that a key factor fueling the disparity in achievement is disparity in teaching. To support learners and close the achievement gap, teachers should use evidence-based strategies, targeted to the students who need them most, leveraging the best formative assessments and early-warning systems to identify students at risk.

Sahlberg (2020) raised the need for more personalized and blended learning for all learners and notes that students who are more self-directed in their own teaching and learning often do better in both normal and crisis situations as such a strategy: “... *strengthens student engagement, brings about authentic learning and helps schools respond better to emerging inequalities*” (p. 7).

This approach requires resources to develop schools as inclusive learning communities with teachers able to use a range of strategies to support more diverse learning needs with the involvement of parents and others as discussed above. Greater stakeholder involvement, for example with curriculum can benefit staff and learners as well as the wider community (European Agency, 2018e).

A school development approach also depends on developing a system of support for leaders and teachers as well as learners (European Agency, 2018e). Such support may come from specialists working with the school, from peers in schools as well as more structured professional development opportunities.

Funding school development using the strategies outline above will create more innovative and flexible environments as set out in the next section. This enables the focus on preventative approaches to be increased which, together with appropriate interventions for learners who require additional support is likely to reduce the escalation of issues leading to drop out and/or exclusion and the reliance on compensatory approaches in the longer term.

Developing innovative and flexible learning environments

In the aftermath of COVID-19, the Council of Europe (2020) notes the need for innovation in learning and teaching, for example by blending face to face and online provision in new ways that may require innovative pedagogical approaches. COVID could therefore potentially serve as a “catalyst to create a new, more effective hybrid model of educating students in the future” (Kaden, 2020). However, as Schleicher suggests this crisis brings to the fore the need for effective leadership in education, at every level (2020).

Bassot (2020) notes some possible responses to issues raised by COVID, including the need for:

- Teacher professional development, including the sharing of expertise/resources;
- Improving the use of technology with the employment of extra technical staff;
- Flexible curricula that bridge formal non formal and informal learning;
- Considering the role of continuous formative assessment;
- Improving home school communication, cooperation with and support for parents; and
- Autonomy for those who thrive at home.

These all require resources to build school capacity to support learning, in particular for those experiencing disadvantage. While there is unlikely to be any single catch-up approach, evidence from the USA and UK suggests that small group tuition may be one effective response (Education Endowment Foundation, online).

Di Pietro et al. (2020) suggest the possibility of rotating attendance at schools as part of blended learning with an analysis of the curriculum to identify which parts are best suited to which approaches. They stress in particular the importance of identifying learners in need of emotional support and a focus on learners in transition to secondary school.

Given that online learning is a way to reduce potential learning losses and increase the resilience of education systems, it is essential to improve teachers’ digital competences, for example with workshops and training courses (Redecker, 2017). Supporting collaborative professional development between teachers (e.g., teacher networks) is also important, to support peer learning (Di Pietro et al., 2020).

Finally, regarding learners who need additional support, in particular those with disabilities, it is essential to provide assistive technologies that can improve communication and mobility and increase participation. Teachers and families may need support here from specialist provision or advisory services but making best use of such technology as part of mainstream provision is likely to reduce the impact of disability/disadvantage on learning. Here, involving students and their families in the assessment process and undertaking on going monitoring of progress is likely to ensure the most effective use of such resources.

The approaches above are likely to increase school capacity to meet the requirements of diverse learners in more innovative and flexible ways, providing appropriate levels of support and intervention—using resources to increase equity and inclusion.

Introducing transparent systems of accountability for inclusive education

Education is equitable when differences in outcomes are unrelated to learners’ background, economic or social circumstances over which they have no control (OECD, 2020). Council of Europe (2020) stress the need to ensure that no students are cut off from the benefits of education and from the possibility to develop their talents and potential to the full regardless of where they live, their gender, their ethnic origin, their beliefs and convictions, the socio-economic difficulties they face and the discouragement they face in their immediate environment.

The measures taken to control the COVID-19 pandemic have had the most impact on those already experiencing disadvantage. This reinforces the need to attend to equity. In particular, the shift to digital/remote learning has exposed and even increased inequities. While some learners, who receive additional support in school may lack the resources needed and struggle to learn remotely,

others will miss the support of their peers as well as access to resources such as libraries, gyms, laboratories etc that often extend opportunities. Such opportunity gaps may exacerbate achievement gaps in the longer term.

For some learners, remote learning has enabled them to thrive without stress caused by for example peer pressure, bullying etc and this raises the need to consider individual approaches and potentially different patterns of school attendance in more flexible learning communities. Above all schools need to adapt to learners not vice versa and teachers need to accept responsibility and respond to learners who need different approaches.

Globally, there is growing interest in “measuring” school performance, for example through standardized tests for the purpose of evaluation, and comparison of national and subnational education systems. This approach stresses outputs (e.g., performance scores, comparative rankings) over inputs (e.g., teacher preparation) in an attempt to quantify and measure education and pursue the idea that teachers can be “materially dis/incentivized to perform better and to increase student- and school-level performance results” (Holloway et al., 2017, p. 6).

The cancellation of such high-stakes examinations and tests due to COVID has raised the issue of reliance on such externally measured standards. Cairns (2020) questions whether exams, as a centuries old model of assessment are the right approach.

Kellaghan and Greaney (2020) acknowledge some advantages of high-stakes examinations including an association with equity and meritocracy; a way to open up education to those who might have been excluded by discriminatory traditions and a degree of impartiality with anonymity of learners excluding the possible influence of student-teacher relationships, political and family influence, or socio-economic background.

Regarding disadvantages, potentially damaging effects on curriculum, pedagogy and learner and teacher well-being are well-documented (e.g., Kelly, 2019; Lingard et al., 2016; OECD, 2017b; Volante, 2017). Muskin (2015) notes that teachers preparing learners for high stakes assessment may narrow the curriculum and the instructional process, allocating more time to subjects that are tested with less emphasis on formative feedback and the development of learners’ personal competencies.

A further challenge is noted by Kefallinou and Donnelly (2016) concerning in particular learners with disabilities who, not being able to fully participate, may be exempted from tests and examinations. While access can be improved by attention to, for example language issues in test papers and reasonable adjustments at the time of the test, for many learners the stress will mean that the exam may not be a true reflection of their performance.

While tests and examinations are widely perceived to be reliable, Rimfield et al. (2019) found that test scores correlate highly with the teacher assessments in the UK In response to the pandemic, they argue that: “... substituting high-stakes exams for teacher assessments might be a good thing, not just during the current COVID-19 crisis, but on a permanent basis” (Rimfield et al., 2020, para. 18).

Overall, the costs of development and marking of tests and examinations contribute primarily to evaluation rather than to serve children’s learning (Donaldson, 2015) while the development of teacher assessment, including moderation (e.g., through the use of exemplar materials, meetings and professional dialog) can have a positive impact on teachers’ assessment practice, as well as teaching and learning more widely. The Council of Europe (2020) notes that the way in which countries design, assess and recognize qualifications may contribute to early school leaving and the number of learners not in education or training.

OECD (2020) suggest that reducing reliance on high-stakes tests will support a more resilient system, taking account of the issues raised above and the need to fund more inclusive ways to recognize and accredit learning and avoid *paying for exclusion*.

Concluding comments

By considering recent work in countries, as well as their responses to the current COVID-19 crisis, it can be argued that inclusive education systems are most effectively supported by a complementary, balanced combination of prevention, intervention and compensation policy actions. Long-term, sustainable developments toward inclusive education systems can be seen as a combination of these three approaches in order to provide high-quality education for all learners, including those requiring additional support (European Agency, in press).

Prevention approaches can be seen as being cost effective and efficient in the long term while compensation approaches may provide short term “fixes”, but are over time cost inefficient and ineffective in terms of supporting system developments (Ebersold et al., 2020).

A country’s journey to an effective and equitable inclusive education system can be identified by movements away from mainly compensatory policy actions, toward more intervention-and prevention-focused policy actions.

On-going European Agency work with its member countries (European Agency, in press) indicates that most countries are moving toward a predominantly preventative approach in relation to their overall policy priorities for their education systems, as well as their specific goals for inclusive education.

In relation to financing policy approaches, five evaluative questions can be identified for reviewing developments:

1. Do financing policy initiatives take all learners into account?
2. Do financing policy initiatives safeguard the rights of all learners to high-quality inclusive education?
3. Do financing policy initiatives promote the active participation of learners and their families in decision-making that affects them?
4. Do financing policy initiatives monitor, evaluate and secure the effective implementation of an inclusive education system?

5. Do financing policy initiatives address barriers to the inclusive education system? (Adapted from [European Agency, 2018d](#)).

Negative responses to these questions will provide an indication of the degree to which financing mechanisms in countries may be paying for exclusion, rather than supporting the achievement of wider policy goals for inclusive education by *paying for inclusion*.

UNESCO/UIS Education Finance

<http://uis.unesco.org/en/topic/education-finance>, The UNESCO Institute for Statistics works directly with countries to compile education expenditure data through an annual survey and helps to improve national statistical systems and adopt new methodologies, such as National Education Accounts (NEAs). Through this country-level support, the UIS is also seeking to reduce data gaps and provide a more complete picture of education spending. With good quality data, governments and donors can see trends in the overall funding of education. They can also see the extent to which different levels of government and families are contributing to education. In short, they see the full picture in striving to provide quality education for all.

The Governance of School Education Systems

<https://www.schooleducationgateway.eu/en/pub/resources/governance-of-school-edu.htm>, European Union education ministers have highlighted the need for modern approaches to teaching and learning and to the governance of school education systems in order to help schools respond to the changing educational demands of learners and society. In 2016, the Education and Training 2020 Working Group on Schools, made up of representatives from European education ministries and stakeholder organizations, was asked to critically reflect on the governance of school education and how systems can address the serious challenges of quality and equity in order to strive for better learning outcomes for all young people. As part of the European online School Education Gateway, a range of European-level resources for improving school governance is presented.

OECD School Resources Review

<http://www.oecd.org/education/school-resources-review/>, The School Resources Review aims to help countries make resource decisions that support quality, equity and efficiency in school education. The Review provides country-specific and comparative analysis on the use of financial, physical and human resources in school systems. It offers policy advice on how to govern, distribute and manage resources so that they contribute to achieving countries' educational objectives.

Financing of Inclusive Education—Mapping Country Systems for Inclusive Education

<https://www.european-agency.org/projects/financing-inclusive-education-mapping-country-systems-inclusive-education>, The Financing of Inclusive Education—Mapping Country Systems for Inclusive Education project activities focus on information collection via desk research and country data gathering in order to provide an update on the previous Agency work as well as build on the findings of other Agency and international work. The key question for the project was: what are the critical factors within financing that support learners' rights to inclusive education.

Financing Policies for Inclusive Education Systems

<https://www.european-agency.org/projects/financing-policies-inclusive-education-systems>, Policy-makers across Europe recognise that funding mechanisms are a critical lever in reducing disparity in education. They require more detailed information on the impact of funding mechanisms on inclusive education that can be used to guide their policy developments. The Financing Policies for Inclusive Education Systems (FPIES) project is a response to this identified policy need.

Country Policy Review and Analysis

<https://www.european-agency.org/projects/country-policy-review-and-analysis>, The Country Policy Review and Analysis (CPRA) work supports reflection regarding the development of country policies for inclusive education. CPRA aims to act as a tool for stimulating discussion in the country concerned. Its central focus is to analyse the available information about current country policy for inclusive education; the CPRA work does not in any way address the actual implementation of the policy being considered.

Inclusive Education in Action

<https://www.inclusive-education-in-action.org/>, IEA is a joint initiative by UNESCO and the Agency. It aims to be a unique online global resource base to facilitate information-sharing and enhance knowledge and understanding of inclusive education. It provides a comprehensive resource and knowledge base of documentary resources and in-depth case studies on inclusive approaches to legislation, policies, programs and practices from around the globe.

Pacific Indicators for Disability Inclusive Education (Pacific INDIE) Project

<https://www.monash.edu/education/research/projects/pacific-indie>, This international project aims to develop a set of contextually specific indicators for disability-inclusive education in the Pacific and guidelines for implementation. The project's goal was to support the implementation of disability-inclusive education in the Pacific Islands and, specifically, to work collaboratively with local and international partners. The indicators were developed to assist countries to evaluate their efforts and develop further plans and targets for providing quality education for children and young people with disabilities. Indicators and guidelines were developed to ensure three strategic objectives of access, quality, and effectiveness and efficiency.

Disability and rate of returns on the investment in education

Although there are debates on what kind of education is needed for contemporary society, there is a common consensus on the need for greater investment to enjoy multifaceted benefits of education. Numerous studies have examined the cost of educating our children; simply put, the economics of education. In short, economic issues in education such as the demand for education, the financing of education, and the comparative efficiency of various educational programs and policies are studied in economics of education. Links between schooling and labor market outcomes for individuals is one of the central components for economics of education (Weil, 2009).

This consensus about the need for greater investment in education is not universally apparent when considering the education of individuals with disabilities. The prevailing assumption is, still, that even if persons with disabilities are educated, they are less likely to make use of the education, or that they will not be useful in the workforce. Though still rare, some studies have started empirically challenging this assumption in lower and middle income countries (Lamichhane and Watanabe, 2015; Mori and Yamagata, 2009; Lamichhane and Sawada, 2013). Adopting an economic analysis, using primary data collected by myself and utilizing secondary data in Nepal, I published a paper with Yasuyuki Sawada (Lamichhane and Sawada, 2013) to build a compelling justification for why Governments and other relevant authorities must increase their investment in the education of disabled children. Our study was the first to estimate the returns to the investment, commonly referred to as *yield*, in education for people with disabilities in developing countries. It gained wide attention from different agencies including the World Bank. A novel feature of this article is its use of micro-data collected on the timing of being impaired during school-age years as a means for identifying instrumental variables for years of schooling.

The data and evidence in this area reveal that after controlling for endogeneity bias arising from schooling decisions as well as sample selection bias due to endogenous labor participation, the estimated rate of returns to investment in education was found to be very high among persons with disabilities, ranging from 19.3% to 25.6% (see Table 1: Disability and returns to the investment in education (Nepal); also, Lamichhane and Sawada, 2013 for details). This yield is two or three times higher compared with roughly 10% for those without disabilities in different regions of the world (see Fig. 1: Global comparison of returns to education). One important point to mention is that although the rate of higher returns to the investment in education for PwDs is observed, it should not be interpreted in a way that PwDs out earn people without disabilities. As educational attainment correlates with the skill level of the occupations that people are able to enter, the higher returns for PwDs could be interpreted as the possibility of increasing wage earning more from what they would have been without education.

Regardless of disability status, poverty is one of the severe issues affecting the lives of individuals especially in low- and middle-income countries. Disabled people have a far higher likelihood of suffering both extreme and relative poverty compared to those without disabilities largely because they are less invested in education by families, communities and the Governments. Keeping discrimination, negative employer and community attitudes and erstwhile obstructions to access aside, it is significant that unemployment is so high even where the requisite education and skills for undertaking the work are low. Consequently, not only disabled people but also their families live in severe financial hardship. However, as stated here, multiple studies for multiple countries have confirmed that investing in education substantially reduces their risk of falling into the poverty trap. Research from Nepal (Lamichhane et al., 2014) demonstrated that the higher the education levels, the lower the likelihood of disabled people falling into poverty. This was even so for minority ethnic groups. Studies also suggest that for disabled individuals, like general population groups, the longer the years of schooling, the higher the probability of getting full-time white-collar jobs compared to those with less or no education (Mizunoya et al., 2018; Lamichhane, 2012, 2015; Lamichhane and Okubo, 2014; Mitra and Sambamoorthi, 2009). It is also important to mention that if proper support is made available, issue of productivity differential cannot be considered as an excuse for not hiring qualified disabled individuals.

Disability biases and change in economic household decision in education

Despite clearly measurable multifaceted benefits of education, and impactful yet unmeasurable positive effects, people with disabilities are deprived of first access to education itself and more clearly to receiving quality education due to several interconnected yet

**Fig. 1** Global comparison of returns to education source: Psacharopoulos and Patrinos (2004).

poorly understood factors. Recent studies indicate factors such as a fundamental misunderstanding of disability, and that poverty of the households is linked to household investment disparity between disabled and nondisabled children. Such investment biases obstruct access to and continuation of quality education for disabled children. When the resources of the family are limited, especially if people with disabilities are the head of the household, their impact on educating their disabled children seems small. Some of the earlier studies have supported this claim. Hoogeveen (2004) noted a significant education deficit in children in households in Uganda headed by disabled persons, linking it with limited or reduced ability of the household to afford school fees due to the direct costs of disability. On the one hand, poor families with a disabled family-member struggle with social stigma in the community and on the other hand, poverty may prevent them from investing in their children's education.

While there are intense debates surrounding the lower school enrollment and educational attainment of disabled people, except for Rosales-Rueda's (2014) research on children with mental health conditions in the USA and Lamichhane and Takeda's (2022) research on Bangladesh, studies are silent on household economic behavior particularly the intrahousehold resource allocation for education for children with disabilities. That said, it is important to note that some of the earlier studies have discussed discriminatory attitudes, parent's financial constraints and institutional barriers as some of the plausible reasons for the lower level of schooling of children with disabilities (Lamichhane, 2013, 2015; Lamichhane and Kawakatsu, 2015; Mizunoya et al., 2018; Takeda and Lamichhane, 2018). Questions arise:

- are these the only barriers to their education?
- Are there additional barriers and biases for intrahousehold resource allocation?
- Why are studies on household economic behavior in education rare or unavailable?
- Is this because research on this topic is considered less important for policy making?
- Is it simply because this sector is overlooked given the dearth of relevant and valid datasets?

On the one hand, the lack of rigorous studies directly causes gaps in education between people with and without disabilities and on the other hand, evidence-based policy making would be negatively affected and implications for the education of children with disabilities continue to be obscured and overlooked.

As their preliminary attempt, Lamichhane and Takeda (2022) conducted a study in Bangladesh to see whether there exists any disability bias in intrahousehold investment in education. In case of the existence of biases, their additional research question sought to locate such bias, either in the stage of enrollment or thereafter and identifying key factors influencing parental investment decisions in the education of children with disabilities. Despite growing attention regarding the quality of education for children with disabilities, Lamichhane and Takeda (2022) found bias in household investment in education mainly in the stage of enrollment decision-making. Moreover, disability bias is found in both primary and secondary levels, indicating that such bias exists in the stage of providing basic education (see Table 2: Difference of Educational Expenditure by Disability Status (Bangladesh); Lamichhane and Takeda, 2022).

According to Table 2: Difference of Educational Expenditure by Disability Status (Bangladesh), the sample that includes out-of-school children suggests that there is a significant difference in educational expenditure at the primary level and secondary level statistically at 5%. On the other hand, there is little difference in educational investment by disability status for enrolled children. The significant difference is detected at 10% level for Secondary age children. They have attributed this to school enrollment of children with disabilities costing more than for children without disabilities given inaccessibility of infrastructure for many children with disabilities, the absence of appropriate support systems. However, once enrolled, the results revealed only small differences

Table 2 Difference of educational expenditure by disability status (Bangladesh).

		Mean difference		
	Non-children with disabilities	Children with disabilities	(Non-children with disabilities–children with disabilities)	t-value
Educational expenditure for both enrolled and not enrolled children				
Primary level	1988.33	1015.08	973.24**	2.56
Secondary level	4190.56	2894.42	1296.14***	2.46
Higher level	5347.69	5154.21	193.48	0.13
Educational expenditure only for enrolled children				
Primary level	2574.50	1682.53	891.97*	1.66
Secondary level	4961.95	4475.4	486.55	0.71
Higher level	12,074.42	13,588.36	–1513.95	–0.46

Note. Each value is calculated by author using dataset from Bangladesh Household Income Expenditure Survey 2010 (HIES). Expenditure is measured in Taka. Gap by disability status is statistically significant.

*10% Significance level.

**5% Significance level.

***1% Significance level. The definition of Children with disabilities is children with disabilities aged below the age of 20 who acquire impairments such as visual, hearing. Physical, cognitive and communication.

in educational expenditure. Parents' expectation on returns from education of children with disabilities is much lower than that of children without disabilities (i.e., expected contribution to household income is lower).

Again, it is important to mention that the education of children with disabilities may be partly driven by shifts in parental opportunistic investment strategies that likely prioritize non-disabled children. By investing heavily in children without disabilities, parents seem to attempt to provide them with a competitive advantage in the acquisition of both resources and friends. However, wealthier and economically stable parents opt for a more opportunistic strategy of educational investment in the required level of education that does not discriminate between offspring regardless of disability status.

Poverty and additional determinants of schooling

Using nationally representative data from various Asian and African countries, we have gained results that household poverty is one of the serious issues negatively affecting the education of disabled people. From the 2005 India Human Development Survey (IHDS), [Takeda and Lamichhane \(2018\)](#) examined the determinants of children's school progression and academic achievements. One of the important contributions of the IHDS is that it attempted to identify respondents' disability status with the adaptation of questions from the Washington Group on Disability Statistics. The questions mostly focused on activities of daily living, interrogating difficulties that respondents faced in seeing, hearing, walking, self-care, and speaking. However, they lacked a question on remembering and concentration. In our study, a person is considered to have a disability if he or she has difficulty in any of the domains. Results revealed important dynamics of disability and income, both negative in educational attainment, completion, dropout and academic achievements. The effect of father's education was small when it interacted with children's disability, whereas mother's education had a positive association in secondary school completion as well as with reading and writing skills. Similarly, using the nationally representative dataset of Bangladesh and utilizing the fixed effects and logit model techniques, we gained similar findings to India ([Lamichhane and Kawakatsu, 2015](#)). We examined the determinants of school participation between children with and without disabilities. In the analysis of total samples, it was observed that while disability is negatively correlated with school participation, once the sample was restricted to just disability, results showed that together with the household head's higher educational level, monthly expenditure and working age members are positively correlated with the probability of school participation.

Furthermore, despite initiatives such as Universal Primary Education (UPE) policy, a study carried out in Uganda ([Lamichhane and Tsujimoto, 2017](#)) found that disabled children's education is especially compromised in households experiencing poverty. More specifically, our findings indicate that those not completing primary school are from poor families. Our findings that disabled individuals who have not benefited from UPE can be attributed to several factors. As UPE is supposed to simply waive the tuition fees and not the additional cost required to accommodate the needs arising from disability; for example, making school infrastructure and roads from home to school accessible together with providing alternative learning resources including textbooks in Braille or assistive devices for different impairment groups, we are in fact unsurprized not to see the desired impact of UPE especially in poor households. Though not specifically researching disability and education, while reviewing UPE situation in Sub-Saharan Africa (SSA), [Bennell's, 2021](#) argument that only those sections of the poor who do not need additional support for primary education could have benefited from UPE also supports our finding that disabled children who might require additional support beyond tuition fee waiver are not positively affected by UPE in Uganda. Though not explicitly concerned with disability, [Kakuba et al. \(2021\)](#) found that only 22% of children aged 13–18 were enrolled in secondary school, and that demand and supply related predictors are moderated by the socio-economic status of households to influence schooling outcomes. Government was to provide free tuition to secondary school students starting with 300,000 primary school graduates in 2007. Parents, on the other hand, were to provide exercise books, accommodation, medical care, meals and other resources. In such circumstances, those in poverty would experience difficulties sending their children to school and obviously its consequences would be larger for disabled children with parents' opportunistic investment strategies in education coming to the foreground.

Intervention strategies to overcome barriers

In order to overcome barriers to education arising from household poverty level, interventions such as *conditional cash transfers* (CCT) and lunch in school are implemented as an effective strategy toward increasing access to education for the general population in various parts of the world. In some countries, programs such as providing lunch to the children in school are also offered to increase girls' access to education. As will be discussed in the subsequent section, the cost for education in general and for disabled children has fundamental differences. Therefore, other than conventional approaches and schemes such as CCT, additional strategies geared for programs with targeted subsidies to increase access to education by disabled children is required. Inaccessibility of infrastructure, including the proximity from home to school, requires additional investment to make them accessible to all. While quality basic education lies at the heart of inclusive development, and access to quality basic education is an ambitious goal to be achieved by 2030, it cannot succeed without identifying the difficulties children with disabilities and their parents face. Policies addressing disability-based discrimination, accessibility of the school environment and social protection schemes are necessary to improve the education of children with disabilities. Pursuant to providing quality education, 2015 Sustainable Development

Goal (SDG) 4 has clearly expressed commitment for quality lifelong education and SDG 4.5 emphasizes the accommodation of the needs of educating disabled people.

Disability related extra costs in education

The goal of a global education program is to equalize the ability of all to participate in society regardless of any differences and functional limitations which could act as a disability when efforts fail to accommodate needs related to impairment. Though all people incur costs for education, such costs may be significantly greater for those with disabilities. [Mont and Cote \(2020\)](#) claim that if all people have the full costs of living with a disability covered, they are on a more equal footing and more likely to be full members of the community. One of the issues that is sometimes difficult to grasp for policy makers and advocates alike is the cost required and the range of difference of costs based on type and severity of disability. The casual observation is that for most people with significant disabilities, extra cost would be required to cover pedagogy, extra assistant teachers, devices and educational materials. Sadly, allocated budget provided in low- and middle-income countries rarely covers basic consumption, let alone disability related costs that many consider to be higher than the measurable benefits resulting from education, especially for those with high support requirements.

In addition, in most low- and middle-income countries, there is less or no distinction between disability related extra cost and the comprehensive impact of education which should be beyond the benefit of rate of returns on education. For many, the measurement of benefit is restricted to wages. The traditional notion of understanding cost benefit analysis focusing only on wage earning disregarding other externalities attached to education is simply insufficient especially for marginalized people. For them, their inclusion in community carries greater significance. In the absence of complementary measures, resulting in part from not having a proper understanding of disability and education citing the scarcity of resources, budget allocated to disability and education generally only supports basic access but does not seriously emphasize the quality and continuation of an education. Nevertheless, considering the wide-ranging benefits of education, countries should not avoid confronting the need for greater investment in education for persons with disabilities.

Intra-household dynamics that could lead to a person with disability being deprived of education has several factors to consider especially in a poor household. Considering the diversity of disability related costs, [Mont and Cote \(2020\)](#) acknowledge that a complicating factor is that not all households with disabilities face the same extra costs. The size of extra costs depends on a variety of factors including not only the type and degree of disability, but also the local environment. Another complicating factor is that the extra costs of education can vary based on whether a school is well equipped and furnished or not and the extent to which their facilities are designed to meet the diverse needs of learners regardless of disability status. If the school has failed to do so, then they must be prepared for necessary investment to make their school and education program accessible.

Nepal initially implemented inclusive education as a form of integrated education. They are yet to identify the cost difference between special and inclusive education. Countries such as Nepal, India, Bangladesh and Uganda, have different levels of support for different levels of disability. This assumes that people with severe disabilities require adjustments in pedagogy and teachers with special training; both requiring higher levels of investment.

Instead of acknowledging the essence of inclusive education:

- achieving excellent education; and
- achieving community inclusion and economic independence,

many low- and middle-income countries have the incorrect understanding that inclusive education is simply cutting resources to provide opportunity for education. Consequently, policy makers and relevant authorities often overlook the investment required to be fully prepared for making schools inclusive with teaching and learning activities addressing the individualized educational needs of all learners.

Methodological challenges in evaluating the cost benefits of inclusive education

In education, one of the issues that often draws mixed attention is its cost. Many economists focus on cost-benefit analyses of education. Though cost is important, it is equally important to mention that all components should be considered. First and foremost, education is the fundamental right of all, regardless of disability. In relation to under-served population groups in particular, positive discussion of cost is often overlooked. Though cost plays an important role, it is equally noteworthy that all states have an obligation to provide basic education at least up to high school level education. This being the case, it is also understandable that the Governments and other relevant authorities in education regularly must make difficult decisions about how best to invest resources to serve their citizens. Yet systematic analysis of the relationship between costs and outcomes of education for people with disabilities is not common in disability studies in education research. This type of evaluation is a fundamental tool for policy makers to decide on the fair allocation of resources.

While discussing cost-benefit, it should consider factors such as economic rate of return (ERR) of education and the benefit-cost ratio. Sadly, discussion around these issues is at best weak or for the most part missing in disability studies in education. While emphasizing returns to the investment, one should be cautious that as education has multifaceted benefits which economists regard

as other externalities, simply measuring education from the viewpoint of rate of economic returns makes it more challenging to estimate cost benefit. Here the positive externalities refer to the benefits other than direct income gained because of the level of education. Enabling people with disabilities to acquire higher levels of education increases their presence in community, raises not only his or her output but also the output of those around him or her. Educated workers can bring new technologies, methods and information to the attention of others. They can teach things to others. The positive externalities of education include the effects of personal networks and the roles educated workers play in them (Münich and Psacharopoulos, 2018)

Other than the direct economic benefits of education, Lamichhane (2012) argued that disabled individuals employed in the workforce can socialize with their colleagues inside and beyond the workplace. The analysis of cost benefit could not capture this return on investment fairly using conventional approaches. Making friends and socializing is a basic human need. Widening one's social horizons leads to a deeper sense of inclusion. When employed persons with disabilities socialize with their colleagues, their increased visibility in the community contributes to reducing prejudice, misunderstanding and discrimination. Such impacts must not be overlooked while calculating the cost for years of schooling and cognitive skills only. If educated disabled individuals acquire skills required for the jobs and are employed, their families can mutually enjoy a sense of positive interdependence, rather than a dynamic of dependency and provision (Lamichhane, 2012).

Therefore, investment in the provision of infrastructure associated with inclusive education is indeed important. According to Levin and McEwan (2001) several factors including:

- **Personnel**—teachers, support staff, aides, administrators, cafeteria workers, maintenance staff, counselors, mentors, coaches, consultants, special education service providers, curriculum supervisors, union representatives, and those providing various services from the district.
- **Facilities**—classrooms, computer labs, shared spaces, buildings, grounds, heating/cooling, lighting, repairs, maintenance, and cleaning.
- **Equipment and Materials**—desks, chairs, white boards, curricular materials, information technology, books, and recreational equipment.
- **Other program inputs**—data protection, data analysts, program evaluators, consultants, project managers.

All required direct cost and that can be somehow estimated by gathering information on market prices (e.g., the hourly cost of personnel to implement a program or construct a database). However, there are many other less obvious resources such as “donated” or additional teacher time (i.e., the extra time teachers spend working outside their contract hours), parental involvement, and opportunity costs which should be equally considered as their value is typically outside of the economists’ calculations. These issues cannot be properly estimated in monetary gains or losses and are therefore complicated to analyze. Also, as their impact is often relatively invisible compared to the other benefits, they are often ignored in narrow cost-benefit analysis. Understanding how to include different intervention strategies such as making school buildings accessible is necessary. Accessible buildings are not just for individuals with disabilities and should not be considered as *additional* costs. It is likely that countries count the budget needed to make schools and infrastructure accessible as a budget for disabled people and thus they conclude that the cost for educating disabled children is significantly higher compared than for the general population.

Although it is difficult to calculate the exact cost benefit of educating disabled individuals, it is possible to measure progress on “inclusive quality education” and its impact on the lives of disabled individuals—their families and communities. First to measure the effect of education between those with and without disability and compare it internationally, we can use the Washington Group on Disability Statistics (WG) WG/UNICEF Child Functioning Module together with WG/UNICEF Inclusive Education Module. Measuring the impact of education or let's say inclusive education on the lives of disabled people, their family and the society itself is important. Building reliable datasets on disability is still a challenge, however some countries have started incorporating questions on disability into their planning cycles which will help us to undertake further studies in this area. We also need to continue lobbying with bilateral and multilateral agencies together with Governments to explicitly include disability related components in all the surveys so that research on various issues of disability can be undertaken and results can be valid.

Although providing quality education with a cost minimization approach is necessary especially in the resource poor countries, citing disability as additional costs to be avoided diminishes the returns from human capital benefits. The accumulation of human capital requires investments in disability. Studies on disability and the nexus of education and employment have indicated that undertaking education is investment in the acquisition of skills and knowledge that will increase earnings providing long-term benefits such as job stability, securing white collar jobs, economic independence and lifting people out of poverty. Despite the long-term benefits of quality education and principally, there being a consensus that education should be a top priority, the education of children with disabilities in low- and middle-income countries was compromised: it is funded by NGOs/INGOs even though in most countries school education is predominantly financed and provided by governments. Departing from NGOs/INGOs funded education of disabled people, in recent years, Governments have started taking responsibility for educating their citizens with disabilities and have increased funding for inclusive or special education.

Because of the collective efforts of Governments guided by several international initiatives such as Education for All (EFA), and respectively goal 2 and 4 of both Millennium Development Goals (MDGs) for 2000–15 and Sustainable Development Goals (SDGs) for 2015–30 for education, we have witnessed improvement for access to education of disabled people in recent years. However, research reveals that simply providing financial support for teachers’ salary and textbooks alone is inadequate. Governments, bilateral and multilateral donor agencies therefore need to increase their support, covering expenses required for the proper implementation of inclusive education considering the reasonable accommodations that disabled children require together with

resolving accessibility issues. Research reveals that simply providing financial support for teachers' salary and textbooks alone is inadequate. Governments, bilateral and multilateral donor agencies need to increase their support, covering expenses required for the proper implementation of inclusive education.

Introduction

Inclusive education policies and practices have been received with praise and enthusiasm by national governments within and outside Europe (Artiles and Kozleski, 2016). However, inclusive education has also been resisted and criticized by educational professionals, researchers and politicians (Slee, 2011). The debates around the benefits and possibilities of inclusive education, which developed in the 1970s and throughout the 1990s in Europe and globally have now become less vigorous. Currently, the idea of inclusive education seems to permeate policies, legislation and teacher training in most European and non-European countries. Despite the universality of the concept of inclusive education, there remains a significant gap in the literature, generated by the lack of critical discussion on the origins of inclusive education and of the paradoxes of its contemporary implementation. This is particularly evident as inclusive education intersects with other equity education reforms (Ferguson et al., 2003). This contribution considers the notion of inclusive education, as framed by the “Education for All” movement and it focuses on contemporary inclusive legislation and policies in three countries, which have adopted the Salamanca Statement and Framework of Action on Special Needs Education (UNESCO, 1994), namely Italy, England and Flanders (Belgium).

The origins of inclusive education policies are grounded in a social justice agenda. Its objectives were to transform education systems to eradicate educational inequalities that had been historically embedded in the socioeconomic and cultural conditions of nations (Sailor et al., 1993). Inclusion intends to disrupt assumptions, practices, tools and policies that privilege certain groups of students and disadvantage others, on the basis of their race, ability level, language and gender (Skrtic, 1995). The objective of inclusive education has always been to design and implement education systems that would be responsive to the needs and interests of students representing a wide spectrum of human variability (Artiles and Kozleski, 2016). Considering these premises, most scholars in Europe and beyond would agree that inclusive education intends to transform school culture to:

- increase access of all students, and not just multiply marginalized groups;
- enhance school personnel and students’ acceptance of all students;
- maximize students’ participation in various domains of activity; and
- increase the achievement of all students (Artiles et al., 2006b).

The original justice agenda of inclusive education has been framed as a matter of individual rights, and connected to access, participation and outcomes. Multiple discourses have circulated in policy and practice in the history of inclusion. These discourses favor certain paradigms that have implications for reform agendas and their implementation. Discourses of inclusive education have been concerned with its justification and implementation (Dyson, 1999). The justification of inclusion is rooted in rights and ethics perspectives. Inclusive education has been justified when special education did not show a positive impact on students’ development. The paramount justification for inclusive education was that access to educational opportunities for all students is paramount (Artiles et al., 2006a). The discourse on inclusion implementation revolves around arguments for engaging in political struggles as a way for change, and pragmatic considerations. In the first case, inclusion cannot be a reality unless political struggle takes place to dismantle exclusionary education systems. In the second case, there are more practical aspects at stake: curriculum, pedagogy, assessment and professional training.

Influenced by an intersectional and interdisciplinary lens such as Critical Disability Studies and Critical Race Studies in Education (DisCrit) (Annamma et al., 2013), this contribution analyses inclusive education policies and legislations in Italy, England and Flanders (Belgium) from a historical perspective. The analysis attempts to answer these questions:

- (1) What is the problem(s) that the policies are trying to address?
- (2) Whose interest are these policies responding to?
- (3) Who's excluded from these policies?
- (4) What does it take to shift these legislations toward equity?

The article starts with an analysis of policies and legislation that paved the way for inclusive education, and its practical tools in Italy. The analysis shows that policies and practices of inclusion are still deeply rooted in the medical model of disability. The medical model of disability is driven by the imperative to “healthy normalcy” (Watermeyer, 2013, p. 29), whose defining characteristic is the location of disability within the individual with biological impairments, ignoring macro-sociopolitical contexts of racism, ableism, and other intersecting systems of oppression (Artiles, 2013). The article then continues with an exploration of the Special Educational Needs Code of Practice for Disability in the UK, which substantially fails its intent of being an inclusive legislation. Lastly, the contribution focuses on the M-Decree policy in the Flanders (Belgium), as a first attempt to implement the UN Convention on the Rights of Persons with Disabilities (UNCRPD, 2006). In conclusion, the article emphasizes how the three countries consider that inclusive education policies and practices are still highly influenced by the medical or “deficit” model of disability. In addition, there seems to be a reformist desire to involve parents and families in the decision-making process related to assessment of and educational provision for disabled children.

Legislation and policy in Italy

This section presents a critical analysis of the Italian laws and policies that paved the way for inclusive education and the creation of supposedly inclusive teaching tools, such as the Individualized Educational Plan (IEP) and the Personalized Teaching Plan (*Piano Didattico Personalizzato*, or PDP). Influenced by the intersectional framework of DisCrit, which exposes the fault lines in ableist and deficit-oriented perspectives of disability to illustrate how disability interconnects with other socially constructed identities (e.g., class, gender and sexual diversity), we analyze the focus of such policies and tools, and their implementation in Italian schools. Finally, we explore the latest amendment to policies regulating inclusive education and its tools, and how these have changed in light of distance and blended learning due to the global COVID-19 pandemic.

Legal framework: a critical analysis

Despite Constitutional obligations, Italy officially introduced the right to school inclusion for disabled and marginalized children in 1971 with *Law 118*. The same right was recognized for adults in 1977 under *Law 517*. Reformist in their objectives, these laws continued to remain anchored to the medical model of disability, the centrality of the “deficit” perspective and of the categorization of disabled and marginalized children and adults (D'Alessio, 2014). The resilience of the medical perspective of disability is particularly evident in the language used by *Law 517/1977*. Here, the importance of categorizing students and distributing them to “special” teachers is reinforced, in spite of the pressure put by the 1975 law proposal wanting to overcome the delegation of disabled students to specialist figures such as “specialized” teachers or social workers and health workers.

Fifteen years after *Law 517*, the publication of the Framework Law on disability—*Law 104*, 1992—maintains the “deficit” perspective on disability and on the bodies of disabled students. From 1977 to 1992, and indeed in the following years, the notion of inclusive education remains embedded within ideas of a “norm”, with ableism as the criterion for functioning, a disability diagnosis by medical doctors, and the specialization of support teachers. In these years, as a consequence of the dominance of the medical model of disability, school practices based on rehabilitation and compensation for disabled students have been strengthened and stabilized (D'Alessio, 2011). A testimony of the centrality of the medical model of disability can also be found in the Presidential Decree published on February 24th, 1994, which specifies the tools for the diagnosis and evaluation of disabled students in inclusive classrooms. The 1994 Decree introduces the Functional Diagnosis, which describes the clinical-functional situation of disabled students. The second tool, the Dynamic Functional Profile, indicates students' development through the analysis of strengths and difficulties at multiple levels: cognitive, socio-emotional, linguistic and communication, sensory, neuropsychological, and learning autonomy. The purposes and implementation mechanisms of the IEP, focusing on learning interventions, social relations and autonomy, are carefully delineated by Article 4 of the Decree.

The publication of the International Classification of Functioning Disability and Health (ICF) by the World Health Organization (2001) has boosted the medical perspective of disability in the protocols for the writing and implementation of the IEP and reinforced the claims of scientific validity of the notion of “functioning”, as a way to establish what students can or cannot do in the classroom. The Italian Ministry of Education (MIUR) has adopted the ICF to frame the guidelines for the inclusion of disabled students in school, containing instructions for IEP writing and implementation (Italian Ministry of Education, 2009). It has also supported research intending to test the application of ICF at every grade level in public schools (Italian Ministry of Education, 2010). The first research sponsored by the Ministry of Education involved 500 schools across Italy, and among these only 95 were selected for testing ICF implementation and financed 1.6 million Euros. This research did not produce the expected results that would have pushed the Ministry of Education to apply the ICF model in all Italian schools, despite the government's numerous requests and published policies. A more recent investigation has been conducted in the province of Verona, in the North East of Italy, to explore teachers' knowledge and application of the ICF in the design of the IEP for disabled students (Pasqualotto and

Ghirotto, 2019). Results show teachers' superficial knowledge of the ICF and lack of its systemic application at school level. Only 20% of the teachers interviewed report that the IEP is actually influenced by the ICF, and only 12% affirmed that the diagnosis made by medical doctors is based on the functioning classification (Pasqualotto and Ghirotto, 2019).

In the guidelines for school integration of students with disabilities (Italian Ministry of Education, 2006) and in the more recent Law 96 of 2019, the writing and implementation process of the IEP is still influenced by the ICF model. However, a significantly low percentage of Italian public schools have adopted the IEP framed through the ICF. The majority of them maintain the design established by the 1994 Presidential Decree. This results in major discrepancies at national school level in relation to the design and implementation of the IEP. Both the 2006 guidelines and the 2019 decree law remain influenced by the medical model of disability emphasizing individual "deficit". Accordingly, the 2019 Decree Law presents significant contradictions. For example, Article 1 on "inclusive principles and purposes" is contradicted by Article 2, which affirms that support interventions are exclusively for those who are certified as disabled. The Decree Law has currently removed disabling premises and language, such as "certified disability". However, maintaining the utterance "with a documented disability to guarantee inclusion" of students creates two main issues. First, the Decree confirms both the categorization and the certification of disability and reinforces a problematic and ableist definition of inclusion for school professionals and education stakeholders. Second, while promoting "inclusion," the Decree remains silent on the presence of special schools and advanced classes for "overachieving" students. The reasonable accommodations supported by the Decree are not extended to all students, but they are considered as compensatory measures targeting students with disabilities.

With the creation of the macro-category of Special Educational Needs (SEN), through the Ministerial Decree of December 2012, and the following Circular of March 2013, the Italian Ministry of Education introduces the PDP for those students classified as SEN, but without a certified disability, which otherwise will not have access to the IEP. Interestingly, even in this case, the Ministry's articulation of the PDP within policies follows the ICF model discourse. As expressed in the 2012 Ministerial Directive and 2013 Circular, the PDP focuses on:

- Certified diagnosis for students with learning difficulties;
- Analysis of students' needs and social contexts through observations;
- Planning of educational interventions based on personalization and individualization;
- Compensatory tools in case of severe difficulties;
- Assessment tailored on students' needs and pathways; and
- Families and students' commitment in order to establish a collaboration (p. 3).

As all of the above-mentioned legal frameworks and policy documents show, the IEP and PDP differ by virtue of diagnostic categories (i.e., disability and learning difficulties), but they are structured similarly in terms of theoretical underpinnings and systemic implementation.

The IEP and PDP both reiterate the dominance of the medical model of disability, based on individual deficits, and the necessity of categorizing children according to what they can or cannot do. In addition, they reinforce teachers' pathologizing attitudes toward students whose identities are at the intersections of multiple differences. Consequently, the notion of inclusion presented by the Ministry of Education is misleading, and the intention of actually introducing a more radical inclusive pedagogy within the IEP and the PDP is extremely limited.

Our analysis reveals five critical points in the current design of IEP and PDP:

1. Risk of exclusion;
2. Standardization;
3. Centrality of teachers and support teachers from dominant backgrounds;
4. Atemporality;
5. Classroom atmosphere.

The following five paragraphs provide a consideration of each of these points:

1. *Risk of Exclusion*: By applying a critical intersectional lens, it is possible to understand that the IEP and PDP can become tools of exclusion for multiply-marginalized students. Leaving unchallenged the medical paradigm, which constitutes the existing tools' foundation. The IEP and PDP intend to include, but they actually control, manage and confirm a perception of diversity according to an individual deficit way of understanding students' differences. Practical examples of this can be found in the emphasis given to differential teaching and curriculum, specialized support teachers, and a different and separated space outside of the classroom for students classified as SEN or with disabilities.
2. *Standardization*: This critical aspect derives from a generic approach focused to the application of a list of tools: mediators, compensatory, and dispensary tools not linked to functions (e.g., reduction of cognitive load, attention and processing support) and the different situations in which these can be used (e.g., explanations, questions, class assignments, personal study). Standardization is therefore limited to the citation of the above tools, supposedly making them neutral and static, without a proper critical pedagogical framework to justify the use of these tools.
3. *Centrality of Teachers and Support Teachers*: This is closely related to standardization as it highlights that, often, the choice of teaching tools and mediators is made without reference to the specificity of the student. The choice of mediators and tools cannot, therefore, be present in classroom practice or in the teacher's didactic thinking, but it must take into account the

implications it may have on the specificities of learning and on the pupil's requests. Of course, there are teachers who take a positive direction, but in various situations the compensatory and dispensary tools are not activated despite being included, above all, in the PDP: for example, when writing notes with maps, summaries, or slides are not replaced. So, the question is not only in relation to the tools (i.e., "What do we use?"), but above all, in relation to its function in the teaching-learning processes of a particular school phase. This implies paying attention to how inclusive tools, such as the PDP or the IEP, can be adapted to follow the evolutionary learning trajectories of specific students.

4. *Atemporality*: This term refers to the risk that tools such as the IEP and PDP are not modified through the years, following students' learning progression and development, and curricular changes. This resistance to change these tools on a yearly basis, highlights how SEN students and students with disabilities are perceived as unable to progress.
5. *Classroom, Atmosphere*: The classroom cannot be represented in a static way, but must be seen in constant change. Classrooms constitute an amalgam of complicated and ever-changing relationships. Classroom atmosphere constitutes an indicator of the group's quality of life and is determined by the conditions that teachers and pupils create through their interactions. The positive classroom atmosphere, however, is achieved through the positive relational and communicative methods of teachers, as well as their attention and intervention aimed at enhancement of personal and group identities and their assumption of responsibility. A collaborative-oriented class atmosphere, developed by a teacher is predisposed to help all students, and not to regimes of sanction and control. In fact, such classrooms favor the use of support and mediation strategies in the management of the difficulties that arise during the teaching-learning process. On the contrary, in non-collaborative classrooms, competition, the accentuated evaluations of the students, the absence of a collaborative climate and mutual support, the lack of attention of teachers to socio-relational dynamics, lead students to use defensive mechanisms.

Current amendments to IEP and PDP

Following the new *Decree Law n. 66* of April 13, 2017, a series of legislative measures were passed in 2020 which established that IEPs would be designed based on the International Classification of Functioning, Disability and Health (WHO, 2001). The IEP based on the ICF model has become a unique tool at the national level to manage disability in schools, and the centrality of families' and disabled students' participation in the structuring and drafting of the IEP (and consequently in PDPs) has been recognized. In the new ICF model, support teachers are not the only professionals with a decision-making power during the functional diagnosis and planning of interventions. Power and decision-making are also bestowed to parents via the School Working Group on Inclusion (*Gruppo di Lavoro Operativo per l'Inclusione* [GLO]), the school body in charge of elaborating the IEP (Tramontano, 2020). Nevertheless, medical experts, such as neuropsychiatrists and psychologists, are identified as key decision makers in the planning and designing of IEPs.

Despite medical expertise being crucial to understanding students' functioning, school contexts cannot be compared to therapeutic settings, with inevitable consequences in terms of teaching and learning strategies. Teachers and school practitioners cannot play a secondary role. Thus, with the latest reforms, the IEP and PDP models remain anchored in the "functional" and "deficit" medical model of disability. Lastly, these reforms have said very little about the practical ways in which schools and teachers are going to engage families, community members and students, and how to monitor students' progress at the end of each year, especially during transitions onto different grades of schooling.

A critical analysis of new inclusive policies and IEP models demonstrates that, although the active participation of parents, community members, and disabled students is highly encouraged for the structuring of the IEP, its philosophy remains anchored in the "functional", "deficit" medical model of disability. Importantly, very little has been said about the practical ways in which schools and teachers are going to engage families, community members and students, and how to monitor students' progress at the end of each year, especially during transitions onto different grades of schooling.

The next section explores legislations and policies on inclusive education in contemporary England.

Legislation and policies in England

This section focuses on one current policy in England, namely the Special Educational Needs Code of Practice for and Disability: 0–25 years, 2014 (Department for Education/Department of Health, 2015). This came into force in September 2014, in response to what the House of Commons Education and Skills Committee (2006) identified as "serious flaws in the SEN system" and their declaration that "the SEN system is failing". The Education and Skills Committee hailed the Warnock report of 1978 a success in "radically changing the conceptualization of special educational needs" and bringing in, first integration and then inclusion into subsequent (1981) legislation and recognized the value of the 1997 Labor Government's Green Paper *Excellence For All Children Meeting Special Educational Needs*, which aligned with the 1994 UN position statement on special education, urging governments to commit to inclusive education.

In spite of this, the Education and Skills Committee declared that the Warnock framework was "struggling to remain fit for purpose" and noted the frustrations this brought to all concerned. Here, the Committee specified parents, children, teachers, local authorities, but not school leaders. The Audit Commission (2002) and Office for Standards in Education (2004) had been similarly critical, specifying that too many children were waiting too long to have their needs met; parents were lacking confidence in the

system, leading to pressure for statements (the formal assessment of special educational needs); and some children who could be taught in a mainstream school were being turned away.

The Code of Practice was presented, in the foreword from the Parliamentary Under-Secretary of State for Health and the Parliamentary Under-Secretary of State for Children and Families as following “extensive consultation” (Department for Education/Department of Health, 2015, p. 11) and as a response to the problems identified by the House of Commons Education and Skills Committee and the Audit Commission. By promising a system that was “less confrontational” (Department for Education/Department of Health, 2015, p. 11), the Code of Practice acknowledged that this had been a problem in the past. The two senior officials promised early identification and assessment of special educational needs, full involvement of children and young people and their parents or carers, and raised aspirations through an increased focus on life outcomes, including employment and greater independence. They did not promise inclusion. They did, however, declare that their vision for children with special educational needs and disabilities was the same as that for all children—that they should achieve well at all stages of education and “lead happy and fulfilled lives” (Department for Education/Department of Health, 2015, p. 11).

The absence of a promise of inclusion should not be surprising when we recall that some four years earlier, the then Conservative Prime Minister declared the party’s intention to “prevent the unnecessary closure of special schools and remove the bias toward inclusion” (HM Government, 2010, p. 29). This followed on from a substantial challenge to inclusive education from Mary Warnock (2005), the so-called architect of inclusion (CSIE, 2005), who has pronounced it “the most disastrous legacy of the 1978 report” (Warnock, 2005, p. 22). Warnock claimed that inclusion—her preferred term rather than inclusive education—was problematic and argued that inclusion could damage children. Using unreflexive language, she argued that the “Down’s Syndrome girl” (Warnock, 2005, p. 35); the child who suffers from such disabilities as [asthma or epilepsy]; and autistic children who “suffer all the pains of the permanent outsider” and makes a strong argument for special schools. At the time, David Cameron described Warnock’s pamphlet as a “stunning recantation” (Hansard, 2005, Col 825). Clearly, by 2010, Cameron had come to see inclusion as less than attractive.

The Code of Practice has status as legislation, creating statutory requirements; as policy, in specifying good practice; and as guidance, in suggesting how practice might be achieved. However, the shady mixture of “musts” and “shoulds” throughout the document make it difficult to distinguish these constituent parts. The document attempts to be helpful in this regard specifying that where the word “must” be used, there is a statutory requirement under primary legislation, regulations or case law on those named to undertake the specified actions:

The bodies listed in paragraph iv. *must* have regard to the Code of Practice. This means that whenever they are taking decisions, they *must* give consideration to what the Code says. They cannot ignore it. They *must* fulfill their statutory duties towards children and young people with SEN or disabilities in the light of the guidance set out in it. They *must* be able to demonstrate in their arrangements for children and young people with SEN or disabilities that they are fulfilling their statutory duty to have regard to the Code.

Department for Education/Department of Health (2015, p. 12; original emphasis, with “musts” in bold in text).

As if anticipating confusion of their own making from indicating “shoulds” alongside the “musts,” clarification is offered:

So, where the text uses the word “should” it means that the guidance contained in this Code **must** be considered and that those who **must** have regard to it will be expected to explain any departure from it.

Department for Education/Department of Health (2015, p. 12; original emphasis, with “musts” in bold in text).

The term inclusive education never appears in any of the 261 pages of the Code of Practice. There is mention of inclusive practice and indeed a nod to the social model of disability in a reference to the UK government’s commitment to the removal of barriers to learning and participation in education. The securing of the assumption of mainstreaming in law through the Code of Practice is underlined, with signposting more than once of guidance, in Chapter 1, relating to inclusive practice. Chapter 1, however, contains no more than a restatement of the presumption of mainstreaming and of “a focus on inclusive practice and removal of barriers to learning” (Department for Education/Department of Health, 2015, p. 25). Elsewhere in the document, where the word inclusion is mentioned, it is expressed vaguely and as something that “should”, rather than “must” be done: “When securing funded early education for 2-, 3- and 4-year-olds local authorities should promote equality and inclusion for children with disabilities or SEN” (Department for Education/Department of Health, 2015, p. 80). It does, however, invoke the Equality Act 2010 to insist that schools “must make reasonable adjustments ... for disabled children to prevent them being put at a substantial disadvantage” (Department for Education/Department of Health, 2015, p. 93).

Referring to the National Curriculum Inclusion Statement, the Code of Practice states that all children should have access to a broad and balanced curriculum and calls for teachers to set high expectations for all pupils and to undertake lesson planning. However, with the specter of exclusion for some never far away, the Code states: “In many cases, such planning will mean that pupils with SEN and disabilities will be able to study the full national curriculum” (Department for Education/Department of Health, 2015, p. 94).

The excessive use of the word “support” throughout the document—appearing 775 times—creates a sense of disabled people as docile and unproductive (Hodkinson and Burch, 2019). There is also frequent mention of “employment” (431 times) and

“independence” (122 times), leading Hodkinson and Burch to contend that the ideology of inclusion has been replaced by an ideology of employment and independence. However, they also observe the note of responsibility and concomitant “steering and regulating” (Rose et al., 2003, p. 324) that this new ideology brings.

The Code of Practice creates little prospect of inclusion and instead adds to what Tomlinson (2012, p. 267) has described as “an expanded and expensive SEN industry.” It also creates some new types of losers. The first of these are key individuals who are “ghosted” or erased from the Code of Practice (Allan and Youdell, 2017) and who might be considered to be the central characters—children with special educational needs. The Code of Practice does this by not naming them in anything other than in general terms. A second set of “losers” are those who have previously been marginal to assessment and provision and who are targeted for enforced inclusion—parents. In their new role as customers, holders of “personal budgets” and purchasers of provision, parents are expected to exercise judgment and responsibility and to accept the consequences of their own decision-making. Such enforced inclusion is achieved through a process of responsabilization (Peeters, 2013; Olmedo and Wilkins, 2017), whereby parents are marked out as both the cause of and the potential solution for the problem. This may ultimately be exclusionary because of the accountability that surrounds this way of engaging parents.

The third set of “losers” are the local authorities. They are at the heart of the “musts” directives throughout the document and are required to take responsibility for what the Code of Practice refers to as the “Local Offer,” and to coordinate agencies across health, education and social care. They are also expected (though not required) to socialize parents into their new roles as customer-purchasers of provision and at the same time manage the consequences of placing requests that may be financially punitive. Schools appear to be the final group of “losers.” They are directed clearly enough on their statutory obligations, but are given minimal guidance on how to ensure their provision is inclusive. They are also given no indication that there will be any accountability in relation to inclusion. The consequences here are inevitable and unsurprising. There appear to be no “winners” in the Code of Practice. Everyone, including the state, is caught in the obligation of ensuring a “better life for those deserving of rescue from the dreadful fate of not progressing” (Thomson, 2013, p. 173).

The Code of Practice fails spectacularly as a policy on inclusion, but it may not have been intended as such. Hodkinson and Burch (2019) note that the efforts to control the population through the promotion of the concepts of independence have depleted activist movements such as the Independent Living Movement. They contend that disabled people should resist the docility and dependency visited upon them by the Code of Practice. There would certainly appear to be opportunities arising from the ineptitudes of the Code of Practice for reforming educational policy and for “wriggling out from the pincer-like grips of modernity” (Goodley, 2009, p. 260). Perhaps the first step toward this would be to replace “extensive consultation” (Department for Education/Department of Health, 2015, p. 11) with stakeholders with a policy construction process which involves them in a meaningful way, and which also gives them control of the discourse production. The article continues with an analysis of inclusive policies in Flanders, one of Belgium’s federal states.

Legislation and policies in the Flanders (Belgium)

As a result of the development of a robust special education system in Flanders during the past 50 years (European Agency for Special Needs and Inclusive Education, 2018), pupils with disabilities attending education were mainly taken care of in a non-inclusive education system of segregated special schools. Table 1 provides a statistical overview of children in special schools.

In Flanders, the Flemish speaking part of Belgium (with 6.63 million inhabitants on January 01, 2020), the M-Decree (approved in the Flemish Parliament 12-03-2014) came into effect at the beginning of the 2015–16 school year (Struyf et al., 2015). This Decree can be considered as the first attempt to organize a legal/policy translation of the UN Convention on the Rights of Persons with a Disability (UNCPRD, 2006) and more specifically of Article 24, this article states that inclusive education is a fundamental human right for every child (with a disability) at all educational levels. The M-Decree can be regarded as a large-scale educational reform (Victoor, 2017). It is a reform developed by the government, but responsibility for practical implementation lies with the schools. Such a great responsibility necessitates support “from above”. Various actions were proposed to support pupils, teachers and schools. For example, in-service training courses were offered with the aim to broaden and deepen the basic competencies of teachers to work more through an inclusive lens. In addition, “competency counselors” were called in at the request of schools, to

Table 1 Statistics students in nursery, primary and secondary special schools in Flanders (Flemish Education in Figures 2018–2019; onderwijs.vlaanderen.be/onderwijsstatistieken).

	2013–14	2014–15	2015–16	2016–17	2017–18	2018–19
Nursery	2042	2000	1984	1967	1986	2140 (T:264575) (type5:+134)
Primary	28,307	27,483	25,578	24,645	24,380	24,784 (T:467059) (type5:+209)
Secondary	20,495	20,661	20,333	20,130	20,331	20,544 (T:448000) (type5:+447)

start giving support to mainstream school teams in their inclusive work. Staff from special schools were also released to support their colleagues in mainstream schools.

Flanders chose from the start of the M-Decree to preserve Special Education (and even create one extra type of special education for children with autism) "... for pupils who need it ...". The Government assumed that consolidating the dichotomy between mainstream and special education could be used for the time being as an in-between phase on the way to an inclusive education system. When the M-Decree was introduced, clear principles were given priority. These principles had to be regarded as impulses to realize inclusive education. We will critically discuss those principles consecutively, adding the critical view in italics:

Principle 1: the M-Decree strengthens the right to enroll (UNIA Interfederaal Gelijkekansencentrum, 2016)

The Decree ensures that every child can enroll in mainstream education. However, from its commencement, the Decree made a distinction between children based on the curriculum they followed. The right to enrollment is being eroded for children with an individual adapted curriculum (IAC) by the option to cancel the enrollment. This feeds the perception that following a common curriculum is a precondition for inclusion. The condition requiring a child to be able to follow the general curriculum seems to indicate that making exceptions to the general curriculum is not viewed as reasonable adjustment, and therefore is the reason for the referral of disabled children to special education (De Schauwer et al., 2019).

Allowing enrollment based on a "cancellation clause" raises the question a priori for some children whether regular education is a viable option for them. Within 60 days the school can decide whether it is possible to give a permanent enrollment or whether the reasonable accommodations are disproportional. Termination of a registration does not always take place based on a thorough assessment of needs and feasible reasonable adjustments. Often a correct assessment of proportionality is still lacking, and schools come no further than a capacity assessment of what they are willing to do. An assessment based on established and transparent criteria is not a common practice. Now it seems too much like a boundary is drawn for those children who have an individual adapted curriculum. In this way, children do not get equal rights. A lot of legal uncertainty arises for families.

Principle 2: the M-Decree embeds the right to reasonable adjustments in educational legislation (UNIA Interfederaal Gelijkekansencentrum, 2016)

Pupils with disabilities are entitled to "reasonable accommodations". That right is laid down in the [UNCPRD \(2006\)](#) and in a Flemish Decree of July 10, 2008 containing a policy framework for Equal Opportunities and Equal Treatment. The M-decree anchored that right in the primary education decree and in the codex secondary education. The protocol of July 19, 2007 on the concept of "reasonable accommodations" in Belgium clarifies how the concept of "reasonable accommodation" should be interpreted. An accommodation is defined as a concrete measure—material or immaterial—that can neutralize the restrictive effects of an inaccessible environment on the participation of a person with a disability. Whether an accommodation is reasonable must be assessed based on well-defined indicators, for example:

- The financial impact of the adjustment, taking into account any financial compensations/subsidies and the financial strength of the person/organization subject to the obligation of "reasonable accommodation";
- The organizational impact of the requested "reasonable accommodation";
- The likely frequency and duration of use of the reasonable accommodation by persons with disabilities;
- The impact on the quality of life of (an) actual or potential user(s) with a disability;
- The impact on the environment and other parties involved;
- The lack of equivalent alternatives;
- The failure to comply with obvious or legally required standards.

In contrast to the right to inclusive education, which can be progressively achieved in Flanders, the right to reasonable accommodation must be immediately guaranteed. In the educational context, the right to reasonable accommodations creates certain obligations for schools. When a child wants to enroll in a school, the school may not refuse the enrollment because the child needs certain adjustments. Registration must be completed immediately. This registration must be followed by an analysis of the accommodations the child needs. Consultation and negotiation with the parents about the concrete needs of their child is an essential step.

The decision about the reasonableness of accommodations in educational contexts in Flanders rests ultimately within the authority of the school. When a school judges that an adjustment is not reasonable, it must be able to demonstrate that it has gone through the process correctly and assessed its reasonableness against the imposed indicators. The school must also actively look for solutions and alternative proposals that are reasonable. It was the job of the competency and/or pedagogical counselors to assist schools in applying reasonable accommodations. However, these counselors themselves felt they were missing expertise in what inclusive education is about, experience with developing reasonable accommodations and using the indicators to judge the reasonableness of an adjustment.

Some obstacles to the build-up of expertise were soon noticeable. To build expertise there was a need for a powerful and stable support model, which was lacking. Regular schools continue to consider that support for children with special educational needs is

the responsibility of internal or external experts. They expect guidance to come from outside of the classroom and to be provided on an individual basis. Teachers downplay their own roles in achieving inclusive education and “are more likely to pass questions [to specialists] because they believe that specialists have” better answers (Van de Putte and De Schauwer, 2013). Indeed, there is more and more outsourcing in regular schools, and research indicates that such outsourcing increases social inequalities (Verschuere, 2016).

Some reasonable accommodations required the intervention of specific disciplines (e.g., speech therapy, occupational therapy ...) these interdisciplinary teams were not available in mainstream schools (some disciplines may also be required when performing medical acts; mainstream schools lack the legal framework for these acts). Schools quickly appear to use the term “disproportionality”. This goes hand in hand with the lack of “a basic care framework” in mainstream schools, as a result of which staff quickly started using “not feasible” or “unreasonable” as an evaluation.

The medical model of disability is still strongly present and dominates practices. School teams are mainly looking at how they can adapt the student to the curriculum and usual school practices and less attention is paid to the question of how to remove barriers in the learning environment. The medical view is inextricably linked to the rapid referral of students to special education. Despite the Decree, it remains clear that inclusion is only possible for students who require minimal adjustments, and who follow the common curriculum. The obligation to make reasonable accommodations moreover is not accompanied by financial measures and a general strategy to make the Flemish education system inclusive (de Beco, 2016).

Principle 3: the M-Decree tightens supervision of the referral of students to special education

The coexistence of two educational systems makes referral a realistic option. A long history of referrals to the special education system cannot simply be reversed by the introduction of a Decree. In principle, regular education was considered the first option of education for all pupils. Special education was only considered as an alternative. It soon became clear that many factors continue to influence referrals. For example, in secondary schools, a student with an Individual Adapted Curriculum (IAC) in a mainstream school can only obtain “certificates of acquired competences”. This situation leads to important consequences with regard to validation of studies. Such a certificate of acquired competencies for a student who follows an IAC in mainstream secondary education provides no entitlement to “professional integration trajectories” and the associated “integration benefits”; these allowances are (in contrast) available to pupils attending special secondary education. Accessibility is a fundamental characteristic of an inclusive education system and concerns the design of and access to buildings, transport to school, circulation within the learning environment, classroom equipment, information and communication, learning resources, and so on.

In the Flemish monitor concerning school buildings (AGION, 2020) we learn that although there is a clear improvement in the evaluation of accessibility compared to the measurement in 2013 (+10%), accessibility measures are often still absent in 2018–2019. Necessary measures and interventions are often still lacking. In 56% of the school buildings there is a barrier-free access and access path, 53% have adapted toilets for students with a disability, and 53% have an adapted parking space. Other measures appear to be present at less than half of the sites, such as the availability of adapted toilets for staff with disabilities, clear signage, an elevator and ramp for level differences. The third edition of the school building monitor also specifically examined whether there were measures being taken in the context of the M-decree. This question shows that 19% of the buildings have been adjusted in function of the M-decree. In 58% it is stated that there is no adjustment. The large number of respondents who are not aware of this is striking (23%).

Investments must be made in strengthening the pedagogical competencies of teachers so that they can cope with reasonable accommodations within the curriculum and school practices. This starts with strengthening their knowledge and understanding of the educational goals and increasing their skills to formulate alternatives to those goals and/or to make adjustments (UNIA Interfederal Gelijkekansencentrum, 2016, 18). We can observe that teachers can follow (after their Bachelor’s program to become Teacher for primary Education) a Bachelor after Bachelor training about special educational needs. The fact that this (separate) program exists proves that basic teacher training is not giving enough attention to care and special needs.

Cooperation between regular and special education is not self-evident. Regular and special education are competing systems in the Flemish educational market. Such a competitive atmosphere does not guarantee a smooth, serene and constructive growth toward an inclusive education system. There are also tensions about the organization of the collaboration. Who determines which expertise and experience is sent to regular education? Who directs the staff? The distribution of all support remains in the hands of special education. Regular education indicates that support is only available sparingly and that it is not working proactively enough. Sometimes paramedical personnel are sent to regular schools. Most of them lack pedagogical expertise. Moreover, it is not always the most experienced and knowledgeable staff who are sent to support regular schools. Their experience is sometimes characterized by a medical view of disability and a standard approach to certain “types” of disability. Sometimes they take that experience with them to regular education, rather than experience with inclusion and strengthening the competences of regular schoolteachers.

It is clear that the implementation of the M-Decree did not go smoothly.

A very good external illustration of this can be found in a media analysis of the M-Decree (Tavernier, 2017). A large number of articles can be found in the press that support the negative positioning of the Decree. For example, there are articles that only describe the Decree as a “cost-saving measure”. Other articles frame the Decree as an “unattainable utopia”. A final group of articles framed the Decree as “unclear and insufficiently provided with information”. Some articles positioned as counter frames mainly

point to “Good Practices”, or to the “unnecessary fear” (of the abolition of special education), in a final counter frame a lot of information is given about the M-Decree.

Conclusion

In each of the three contexts reported—Italy, England and the Flanders region of Belgium—we can see some striking similarities. The most significant of these is the continued presence and force of the medical model of disability. This is attributed in part to the robust legacy of special educational needs, but in the case of Italy, can be seen as directly influenced by the application of the ICF. This International framework has brought a new legitimacy to the classification and assessment and subsequent individualization and personalization. International influence has been felt in both Flanders and England, through the [UNCRPD \(2006\)](#), but whereas in England this has merely constituted an affirmation of the government’s commitment to inclusive education, in Flanders the [UNCRPD \(2006\)](#) enshrined the right to a reasonable adjustment within the M-decree. However, the possibilities for exceptions to be made on the grounds of being “not feasible” or “unreasonable” have become apparent. [Buchner et al.’s \(2020\)](#) study of seven European countries also highlights the extent of the conservation of well-established special education systems which, together with “persistent ableist ideology” (p. 13), leads to a failed implementation of inclusive education.

A desire to secure the involvement of parents and families in decision-making about assessment, IEPs and educational provision is evident in the legislation and policies of each of the three countries. However, it is compliance and cooperation, rather than empowerment and authority that seems to be sought from parents and families. There is little evidence of efforts to strengthen parents’ capacity to function on an equal footing with officials and a strong sense of their continued construction as recipients, along with their children, of provision.

Teachers are recognized in the Italian, English and Flanders legislation and policies, as being central to the success of inclusive education. At the same time, their lack of competence, especially in relation to curriculum adaptations and making differentiated decisions based on individual needs, is exposed. Another legacy is also exposed here—one of training teachers only to recognize deficits and to default to standardized approaches of teaching and assessment. This overemphasis on students’ impairments and the failure of teacher training to equip teachers with the skills they need is also noted by [Buchner and Proyer \(2020\)](#) who consider it to be one of the key barriers to progress in inclusive education. Teacher education (rather than training) would be a good place to begin the shift to a more equitable and inclusive education system in Italy, England and Flanders. This should include, as [Buchner and Proyer \(2020\)](#) suggest, inter-disciplinary co-operation, co-operative teaching, group work, curriculum modification, differentiation and a range of teaching strategies.

Inclusive education, we are reminded, has become a “global concept” ([Boyle and Sharma, 2015](#), p. 2; [Buchner et al., 2020](#), p. 1). But this status brings with it new pressures in the form of demands for universality in meaning and competition to be further ahead—more inclusive—than other countries. We might do well to consider inclusive education, as traveling theory, as suggested by Edward [Said \(1983](#), p. 226): “Like people and schools of criticism, ideas and theories travel—from person to person, from situation to situation, from one period to another.” During this differentiated direction and pace of travel, according to Said, there is a certain displacement of ideas which includes “acknowledged or unconscious influence, creative borrowing, or wholesale appropriation” (p. 226). Although this displacement can be transgressive, disruptive and potentially productive it is also, importantly, colonializing and reductive. In order to shift the legislations and policy in Italy, England and Flanders toward equity and to move closer to the realization of inclusive education, we need greater criticality, curiosity and suspicion of the legislative and policy processes. We also need enhanced capacity among stakeholders to enable them to become actively engaged in the construction of legislation and policy.

Introduction

Living sociably in a context of human diversity has come to be recognized as one of the critical social challenges of our times. As a site of socialization where differences meet, education is a fundamental site where issues of diversity need to be addressed. In this article, we develop an approach to mapping differences of learners, examine the historical approaches of diversity so far, and offer a framework for inclusive pedagogy that comprises selected elements of previous approaches, while having a different end goal, one that we term “productive diversity.”

The dimensions of learner differences

The starting point of an inclusive pedagogy, that accepts and harnesses diversity in theory and in practice, is the recognition of the varied dimensions of differences that learners present in educational settings. Kalantzis and Cope (2016) have suggested a set of factors that can be used to categorize the human and learner differences and can guide the definition of one's identity, either as a self-definition or as a definition by others.

There are three main categories in this typology of human differences:

- *Material conditions*, which include social class, locale, and family;
- *Corporeal Attributes*, which include age, race, sex and sexuality, physical and mental abilities; and
- *Symbolic differences*, which include language, ethnos, communities of commitment, and genre.

We will now analyze the meaning of each of these categories and subcategories.

Material conditions

Social class

The first subcategory of material conditions comprises social class. Social class refers to the separation of society in groups, based on unequally ordered social structures, that have different access and control to material resources and social power. Throughout history, terms like slave-owner and slave, serf and feudal lord, worker and capitalist have been used to describe differences in social class (Hindness and Hirst, 1975). The subcategory outlines the relationships of power and control of one group over the other. During modern times, material inequality generated by the differences of the social classes has been intensified (Piketty, 2014), despite the more complicated classification and transformation of the social classes (Wright, 1985). In education, the subcategory of social class has been correlated with success and failure in schools (Bernstein, 1971; Bowles and Gintis, 1976).

Locale

This subcategory refers to the various favorable or unfavorable circumstances that occur in different locations (neighborhoods and regions) affecting education, employment and access to social resources. The circumstances established in each location are correlated to a great extent with the social classes (Harvey, 1996). More broadly, locale can be conceived across post-colonial divides, between the Global South and Global North, or between what are euphemistically called "emerging" versus "developed" economies.

Family

The third subcategory of material differences refers to the notion of family. Family pertains to the various relationships of domesticity and cohabitation that form socialization settings. Family structure and practice is a significant determinant in the domain of education, as it influences both informal learning and the connection with formal learning institutions.

Corporeal attributes

Age

Age is considered an element to determine bodily and mental capacities (Piaget, 1923/2002). By extension, it also defines pertinent and proper methods and ways of learning and teaching.

Race

Race refers to the observable characteristics that different human populations have as a result of the interaction of their genotype with the environment. These characteristics include skin color, facial features, hair color and texture, height and physique, and their biological importance is insignificant. Learning scientists today agree that intelligence and ability to learn are not rooted in the racial characteristics of an individual (Fraser, 1995). Nevertheless, race remains a perilous subcategory of the typology, as it supports "racist" claims and uses deceitful biological claims to justify inequality (Miles, 1989; Roberts, 2011).

Sex and sexuality

Sex refers to the biologically genetic differences between males and females. Sexuality concerns the biological tendencies to form bonds of sexual intimacy. Nowadays, there is a broader range of sexualities acknowledged, such as intersex, homosexuality, bisexuality, transsexuality or asexuality (Herdt, 1994; Mayo, 2013).

Physical and mental abilities

There is a range of bodily form and cognitive capability that expands and refers to what is framed as "disabilities". These can refer to impairments or conditions that affect hearing, sight, speech, mobility, child and adult development, learning, psycho-emotional challenges, and chronic illness. However, disabilities can also be understood as the deficiency of social and physical context to accommodate appropriately all the dimensions of physical and mental abilities (Bowe, 1978). This way of framing disability and disablement is referred to as the "social model of disability" (Oliver, 1990).

Symbolic differences

Language

Language concerns oral and written words and phrases. In educational settings, learners are differentiated in classes and modes of teaching and learning depending on the factor of language, for example regarding their first and second language in relation to the language of instruction if they speak a dialect, or how their social language relates to the accepted academic discourse (Kalantzis and Cope, 2012a).

Ethnos

Ethnos is the cultural identity of a “people.” Nation-states are trying to create “nations” that are connected with the geopolitical region that the state/country is located in (Anderson, 1991; Gellner, 1983). Nevertheless, nations cannot maintain their autonomy and ethnic diversity appears often within them, going beyond the borders of countries and states. Similarly, the indigenous identities are also disrupting the idea of a “pure nation” (Nakata, 2001). The same happens with diaspora communities that bring their identities with them to new places due to migration (Glazer and Moynihan, 1975).

Communities of commitment

Religion and political orientation are commitments that bring people together and they traverse the subcategories of language and ethnos (Bourdieu, 1993). These commitments are often complemented with processes of affiliation and institutional structures. Similarly, even being areligious or apolitical comes with the commitment of rejecting others’ declared commitments.

Gendre

Kalantzis and Cope (2012b) have proposed the term “gendre” to outline the symbolic and cultural traits that are related to sex and sexuality. Gendre extends the idea of gender (considering only male and female) and captures the complex and hybrid realities of sex and sexuality in the modern world, as well as their symbolic manifestation as identities.

The categorization of human characteristics is both necessary and raises inevitable problems of oversimplification. In creating educational policies and practices, it is important to think about these categories analytically and use them with great care.

Categorization of differences for an inclusive strategy

In this section, we want to highlight the issues that arise by using the above categorization in a simplistic way to guide everyday interactions. We also want to suggest an alternative method of categorization, that of “lifeworld differences.”

The confounding factors of the categorization

Unmanageable lists of differences

The list of categories and subcategories outlined above encompasses a finite number of the human and learner differences. This is necessary in order for it to be feasible for stakeholders in the provision of social services for policy building and to manage diversity in their everyday practices. However, over-simplification inevitably occurs, glossing over important nuances of human reality and experience. Therefore, it becomes critical to create a categorization that is subject to continuous refinement. As a result, we create an ever-extending list of categories and subcategories. The more finely grained the account of differences, the less manageable it becomes for stakeholders.

Internal group variations

Within any demographic classifier, the internal differences cross an enormous range. In fact, it is frequently the case that the internal differences within a group are greater than the average difference between the groups captured by the umbrella categories. Large and oversimplified categories can contribute to stereotypical generalizations that may lead to discriminatory actions. In educational settings, diversity programs with proper intentions can end up having counterproductive effects. One example is the oversimplification of the deficit models of education based on “disadvantaged” background. However, there are circumstances when “disadvantaged” background becomes the stimulus for students’ success and resilience (McGinty, 1997).

Intergroup relationality

The groups of the categorization are not distinct, as the semantics may tend to indicate, but defined in relation to other groups. Therefore, groups are defined in terms of social relationships of comparative power, privilege and access to resources. Through time, the groups evolve based on these historical and continuous intergroup relationships. In educational settings, these relationships (e.g., racism, sexism, comparative socio-economic privilege) are present and influence the group dynamics, focusing more on the intergroup definitions than on the internal features of the group members.

Intersectionality

A person will inevitably be a member of many different categories and subcategories in the aforementioned typology. The moment a person is classified to a category, this characteristic of the category interacts with the person's other characteristics and, thus, the categories transform. They take a new meaning, a unique form, that describes the identity of that specific person. This phenomenon of the identity that has many layers and aspects is known as "intersectionality" (Crenshaw, 2015). Each categorization of a person forms the unified whole. Every human is a unique combination of dimensions of differences, that create a unique blend of community experiences, based on the transformed characteristics of the categories. Through this process of transformation, each feature of the categories, when it is ascribed to a person, means something different than its original definition, due to the interaction with the other variables that constitute this person as a whole.

Change

The final factor that confounds categorization is change. The groups named in the categorization are never stable. They are dynamic and people, as social actors, change them individually and collectively. These changes occur either from people inside the groups: e.g., a woman who wants to change the role of women, or from outsiders: e.g., educators who want to assist their learner's transformation and growth beyond the possibilities that are attached to the initial definition of a category.

As it can be inferred from the above analysis, the role of categorization has lost its initial operational legitimacy. Nevertheless, we should not disregard it. The categorization has historical and pragmatic meaning, as it is a proof of the struggles for justice, recognition and institutional accommodation for the various differences. The categories are critical to remind us of our past and how we evolved and progressed through time to arrive in the situation we are in today and the way we need to view differences in the future of society. While keeping the categorization as a reminder and call to action, we need to embrace a more nuanced perspective and attend to the realistic differences in the world, which are called "lifeworld attributes."

The "lifeworld differences" framework

The notion of "lifeworld" refers to the things we know without consciously thinking how we ended up knowing them (Bourdieu, 1993; Cope and Kalantzis, 2000; Habermas, 1981/1987; Husserl, 1954/1970; Kraus, 2014). It concerns the way we are without deliberately deciding to be that way. It involves a set of habits, values, behaviors, and interests that are given and taken for granted in a specific context. The lifeworld is the basis of the person's existence, what they have learned and what they continue to learn and experience in their everyday life. Thus, the lifeworld is dynamic, unpredictable and continuously changing.

In formal educational settings, the lifeworld encompasses the lived experience that learners bring with them and has shaped their identity and subjectivity. This includes the influences from their family, local community, their friends, their peers, and the culture that they identify in. A lifeworld differences framework reveals the issues that come with the demographic categorizations, like over-generalization, unhelpful or false categorization, and even counterproductive stereotypes.

In what follows, we present some of the characteristics that constitute a lifeworld attributes framework.

Affinities

Affinities refer to the associations that a person identifies in and their meaning, which together build what the person is. The notion may include formal membership connections to groups, relations in networks, as well as informal connections in common causes.

Personae

The concept of "persona" refers to the type of person we imagine ourselves to be and present ourselves like this to others. It is the idea we have of how others see us, as well as how we want others to see us. This can be conscious, semi-conscious or unconscious. One's persona can be expressed through gestures, ways of behavior, social intersubjectivity, modes of "presentation of self" (Goffman, 1959), fashion and person-to-person interactions.

Agencies

In the framework of lifeworld differences, a person has a greater ability to act and define oneself in respect to their symbolic qualities. Even when inequalities of access to material resources continue or deteriorate, the arena of symbolic differences fosters greater agency for self-making and self-definition.

Narratives

This idea refers to the trajectories that people follow in their lives. A person's life narrative includes their past, present, as well as their goals and aspirations for the future. It reflects who the person is and how they portray their being.

To sum up, the lifeworld differences framework provides greater agency to a person to define themselves regarding their symbolic and corporeal differences, in contrast to the previous demographic categorization that was administered top-down. Concerning the access to material resources, despite the fact that they continue to exist and there is also greater polarization, a person has again greater agency to define their position in this area. In a learning context, a student has the agency to achieve intergenerational upward mobility by using formal educational qualifications and get access to material resources. Similarly, a learner by becoming political, can offer support to reform agendas that diminish or eradicate material inequalities.

Through the framework of lifeworld differences in learning situations, the process of self-understanding and understanding one's identity leads us to a far more refined comprehension of learning needs and the realities of the learners than it was ever possible with demographic categorization alone. This framework concentrates on the narratives of a person and their inter-relations. As for learning, it leads to success or failure depending on the degree that it engages with the subjectivity of learners. Therefore, in education, it is fundamental to address the differences in a deeper level and with a more refined approach than demographic categorization. Real learners are defined, beyond the demographics, by what they have already learned and what experiences they bring with them, and education should account for these attributes in order to aim for improved learning outcomes.

Historical responses to learner differences

Historically, there has been a range of alternative paradigms for addressing and negotiating the differences of humans in societies and specifically learners in schools. These paradigms are exclusion, assimilation and inclusivity. Each uses in different ways the demographic categories that we have analyzed earlier in this chapter.

Exclusion

Exclusion addresses the diversity that humans present by setting strict boundaries and promoting norms of homogeneity for people in social spaces. In this paradigm, difference has no place. It cannot be accepted in any way and people that are different are renounced.

Assimilation

Assimilation is a process whereby differences are viewed as something that needs to be changed in order to fit the "normal" standards. The dominant groups set these rules of sameness as conditions of entry in a social space. If the process of change fails to fit the standards, then access to social spaces is denied and dominant groups pretend that these differences do not exist, as a consequence of which the diversity of groups of people is ignored.

Inclusivity

Inclusivity aims to address the historical inequalities and injustices that come with differences as a result of changeable access to material resources, the corporeal attributes and the symbolic meanings of a person (Kalantzis, 2000). Inclusivity is an aspirational process that requires constant struggle, since the demographic categorization and approaches of the previous two paradigms still persist in our contemporary society. There have been some intermediate steps toward inclusivity, such as the idea of tokenistic "multiculturalism" (Castles et al., 1992; Glazer, 1997; Taylor, 1994) that celebrates symbolic differences, but doesn't necessarily improve social access. Even when intermediate actions are ambitious, results are mostly disappointing.

Inclusivity aims to achieve recognition of symbolic differences, and through redistribution aims to address material differences by sharing them more equitably. Inclusivity in practice contains elements of the previous two paradigms, but with the variation that these practices are without prejudice toward differences. For example, when linguistic minorities speak the dominant language this resonates with ideas of assimilation, or when specialist schools are designed for specific ethnic and linguistic communities, this seems to point to exclusion. Nevertheless, these practices do not have the same intentions as in the previous paradigms. Their goal is to extend participation, to offer equitable access to resources and to support a balanced reciprocal flow of symbolic interactions and equitable access to material resources.

Toward an inclusive pedagogy

Contemporary schools frequently follow the traditional paradigm of education by promoting sameness. In such schools, teachers, textbooks and the syllabus possess and transmit the knowledge and students listen and try to commit this knowledge to memory. In the end, students undertake tests that will evaluate if they remember the instructed content. Discussions in classrooms are one-sided, as the teacher asks a question and a student responds with the correct answer, without leaving leeway for diverse responses. This architecture of the classroom operation is a process that promotes sameness. As we have articulated before, this architecture does not correspond to the reality of the lifeworld.

An inclusive pedagogy, by contrast recognizes diversity and works with the learner differences. It constructs equal opportunities for all students, not identical opportunities, but of the same kind and value, regarding access to material resources, such as employment opportunities, civic participation, senses of belonging to broad and localized communities (Kalantzis and Cope, 2012b). In this context, learning is a process of accepting as a base the lifeworld experience and the cultural repertoire of learners—extending these, without leaving them behind, in order to achieve enhanced outcomes.

Following, we present some of the elements of an inclusive pedagogy:

Awareness of learner profiles

In educational settings, it is essential to know your students; for example, what languages they speak, their socio-economic background, and so on, by addressing all the demographic categories and subcategories that were outlined earlier in this article. This is a starting point of knowing the students, but we should not stay there. For an inclusive pedagogy, knowing your learners is a continuous, dialogical and open-ended process that needs to be embedded in the curriculum. Drawing from the Learning by Design and Multiliteracies pedagogy of [Cope and Kalantzis \(2015\)](#), “experiencing the known” is a process where students bring their lifeworld experiences to school and work with them and then, they are “applying creatively” what they have learned to school into the real world, by evolving their current lifeworld. Therefore, in an inclusive pedagogy, lifeworld differences of learners and teachers need to be recognized and mutually evolved and extended. The ultimate goal of such a pedagogy is to expand the horizons of learners, having as a basis their current lifeworld.

Differentiated curriculum

In the context of inclusive pedagogy, the one-size-fits-all instruction has no place. The instruction should be adaptive, personalized or differentiated, having as the ultimate goal adjusting learning to individual learners ([Walkington, 2013](#); [Wolf, 2010](#)). In the contemporary society, with the massive use of new digital media, this process has become more straightforward and practicable. New educational media elements like dashboards, on-the-fly learning analytics, alternative navigation paths and adaptive learning mechanisms make the idea of differentiated instruction manageable. Students can do the same thing at their own pace, space and time or they can work on different things that correspond better to their interests and needs. Through this process we aim to achieve better outcomes by respecting our students’ identities and lifeworld.

Recursive feedback

In an inclusive pedagogy that accounts for learner differences, feedback needs to be provided to students according to their interests, needs and topical focus. Recursive feedback or formative assessment ([Black and Wiliam, 1998](#); [Wiliam, 2011](#)) is a practice that provides feedback to students based on where they are in the learning process and what they want to achieve. Nowadays, with the abundance of digital tools and the advancement of technology, machine feedback and machine-mediated social feedback can be easily produced and be part of all the learning environments ([Cope and Kalantzis, 2013](#); [Cope et al., 2011](#)).

Amplified learner agency

An inclusive pedagogy should offer greater learner agency and use the identity and subjectivity of students as a driving force in the learning process. Learners are considered knowledge producers and not knowledge consumers of already created facts, definitions, and procedures. The influx of new media in the contemporary society has introduced increased opportunities for learners to have an active role in communication spaces. The affordances of the new media have promoted a shift in the balance of agency, where learners are no longer recipients of information, but knowledge and content creators. This change should be harnessed in an inclusive pedagogy. Learners should navigate and evaluate critically the abundance of sources that are available online or in community experience. Learners should be positioned as disciplinary practitioners and evidence of their learning should be evaluated in the knowledge artifacts they have created, for example: student projects, online discussions, navigation paths that they followed through games, simulations, or intelligent tutors. This way, the world of knowledge is redesigned by active learners and according to their interests, identities and experience. This outcome is also the goal of the well-known project-based learning approach ([Kilpatrick, 1918](#); [Rugg and Shumaker, 1928](#); [Waks, 1997](#)) that is long-cherished in the domain of education.

Augmented learner agency also means that the curriculum should cater for different starting points and it should allow learners to go after their interests, engaging the characteristics of their unique identity. It must embrace different modes of meaning-making and expressive potentials. It should offer alternative pathways and destinations through the learning process. Following such practices, an inclusive pedagogy provides to learners the opportunity to move and alter their pre-defined destiny according to the demographic categories, and it opens their horizons of possibility, as well as letting them transform themselves to something outside of the foregone conclusion, according to the discriminatory historical paradigms.

Productive diversity

The utilization of learner agency as an integral part of the learning process creates the basis for a new way of collaborative learning. The diverse perspectives of learners when brought into a discussion prompt more meaningful and deeper arguments. The possibility to choose to work on the topic the learners want, and a subsequent process of peer feedback exposes them to a range of diverse perspectives and ways of thinking. Sharing work-in-progress and finished works that are on different topics provides a range of different knowledge aspects to learners. Thus, the diversity of students’ lifeworld and their consequent perspectives develop into

resources for learning. This way, knowledge creation and learning engage more productively with diversity and set differences of experience, perspective, paradigm and expertise as the basis of the learning ecology they operate in. These generative synergies of difference are called “productive diversity” (Cope and Kalantzis, 1997; Page, 2007). The educational objective of productive diversity is to reinforce the self-development of learners, by encouraging them to navigate change, negotiate diversity, create shared understandings and extend their cultural and knowledge repertoires.

Measuring comparabilities

Through an inclusive pedagogy, the intention is to achieve learner self-transformation, by recognizing and engaging with the student's differences in the process of knowledge construction and learning. In such a case, traditional summative assessment that tests the knowledge of students in the end of a course cannot work. Each learner, through an inclusive approach, is developed uniquely and not in the exact same way as the other learners. This situation calls for innovative assessment and evaluation practices, like portfolio evaluation, peer-to-peer reviews, self-reviews, and “big data” analyses of learner progress (Cope and Kalantzis, 2015). These types of assessment should not target to measure identical “standards,” but comparabilities. They should check for evidence in the knowledge representations and the learning activity that are comparable in terms of epistemic effort, intellectual results, cognitive or practical difficulty. The main idea is that there is no need to ask all learners and their products to be exactly the same in order to be equal.

Concluding remarks

Learners nowadays should be seen as complex human beings with changing and self-defined attributes that can be reflected only in the narratives of their history and experience. Reflecting on the elements that we suggest as part of an inclusive pedagogy, the fundamental idea is to set learners' differences in the center of the learning process and utilize them in ways that contribute to their self-transformation. This means that in an inclusive approach, differences are recognized, they are utilized in the knowledge construction, and institutions provide the necessary circumstances for these processes to occur. Toward the achievement of this purpose, the typology of demographic categorization is a starting point. Practices of assimilation and exclusion can be present, but their intention is to provide safe spaces and accommodations for learners that will lead them to thrive in the environments whose ultimate objective is inclusion. As a consequence, in an inclusive pedagogy approach, strategies from all the historical paradigms can be exploited, as long as their underlying objective is only that of an inclusive productive diversity.

Introduction

The term “within-school stratification” emanates from a long lineage of research into the ways in which schools and school systems differentiate educational opportunities of students over the course of a child’s school life. The notion of stratification builds directly from sociological analyses of occupational and status differentiation within the broader society structured by “layers” of socio-economic-status that have characterized most economically developed nations since their origins. While the first sociological theories developed different theoretical lenses for understanding that development (from the classic triad of Marx, Durkheim, and Weber), the role of schooling in the social and economic reproduction of those differentiated social layers has been a specific focus since the 19th century beginnings of mass education systems. Within the sociology of education, debates about which theoretical framework best characterized the functioning of schooling continued at least until the late 1980s (see, for example: [Hurn, 1993](#)). What’s important to note about those theoretical debates is that there wasn’t really debate about whether or not schooling did differentiate students into different pathways, which in turn typically led to differentiated social opportunities. The debate was largely about whether or not the differentiation was legitimate or functioned in a manner claimed by common rationalizations, evident in the debates on “meritocracy”.

In both the US and UK (and beyond), the specific focus on the stratifying effects of schooling came into sharper focus after WWII, due to at least four major historical developments. First, systems of schooling with relatively small portions of the population attending secondary school (in mostly urban contexts) had previously based educational differentiation on different types of secondary schools, following (roughly) the split between academic and vocational schooling—itsself inherited from the turn of the century. But after the war, the creation of comprehensive high schools was a growing transformation as vertical educational expansion saw increases in the proportion of students entering public (government) secondary schooling on both sides of the Atlantic. This transformation of secondary schooling was motivated by contradictory rationales, from interests in maximizing what we now call human capital (a la [Conant, 1959](#)), to the second major historical development: political calls for equal educational opportunities based on moral commitments to social equality. Ultimately, the focus on equal opportunity was directly implied in the then new debates about “meritocracy” (as in, e.g., [Halsey, 1977](#)). Third, the growth of quantitative sociological analyses based on large scale measures of outcomes and effects of institutional arrangements ultimately led to the landmark US analysis of equal educational opportunity led by James Coleman ([Coleman et al., 1966](#)). Developed in the context of the US equal rights movement, that report was particularly notable for documenting the degree of *between* school racial and economic segregation *and* that variance in student achievement was far greater *within* schools than between them (see [Gamoran and Long, 2007](#)). Fourth, specifically within the sociology of education, growing recognition of the importance of within-school processes, of the need to examine inside “the black-box” of schools, motivated several qualitative accounts of schools and classroom, such as Colin [Lacey’s \(1970\)](#) case study analysis of an English grammar school, or Phil Jackson’s ([Jackson, 1968](#)) US-based *Life in Classrooms*. The seminal account of these developments, and the ultimate call for a “New Sociology of Education” (the sociology of curriculum), remains Karabel and Halsey’s introduction to their benchmark text ([Karabel and Halsey, 1977](#)). The term “New Sociology of Education” was specifically created by Young ([Young, 1971](#)) to direct attention to the role of curriculum within the larger context of social and cultural reproduction.

Since the focus on within-school stratification has been recognized as a significant factor in the unequal distribution of educational opportunity and outcomes, there has been a very substantial production of research generated in the attempt to understand and potentially alter the now well documented inequities of conventional school structures and processes.

Two more general points need to be kept in mind. First, there is substantial research and evidence which makes it very clear that between school differentiation plays a significant role in the social reproduction of educational inequity. The degree to which this is true varies both between and within nations—but it is almost always true to some degree, even in school systems of the remaining socialist nations (see e.g., [Griffiths and Arno, 2015](#)). Second, we need to acknowledge that the institutional educational conditions at both ends of the pathway on which we focus here are also implicated in educational inequity. At both the pre-school, early

education level and at the post-secondary school tertiary level, processes which produce educational inequities are at play. Here, however, we will be focusing only on within-school stratification.

To organize this overview of that research, we will present relevant research along the pathway students would travel from initial primary/elementary schooling through to the end of secondary school attainment. From within the more quantitative driven sociological research, in addition to the overall pathway framing, it is important to also note two different phenomena. Consider **Fig. 1**: Hypothesized pathway of within school stratification below: a heuristic model of the hierarchical structures typically found within primary, middle and secondary schools (labeled in simplified high-middle-low terms) and the plausible pathways between these structures (whereby students may “move up” or “move down” as they proceed through schooling). The structure of this model is meant to represent the various foci of research addressing within-school stratification. That is, we will discuss literature that:

- (1) has described or measured the effects of different “levels” of hierarchically structured learning opportunities at each level of schooling; and
- (2) the literature which addresses the relatively likelihood of students taking one of the hypothesized pathways available to them, often referred to as transition points by sociologists of social stratification.

Because the nature of the various phenomenon being studied, differential learning experiences versus likelihood of following different pathways, the research documenting the consequences of their object of study can be split into two forms: the first is typically studied by reference to an amount of learning or achievement, the latter by reference to subsequent placement within the next levels of a hierarchically structured educational system.

Two more general points need to be made about the vast array of literature related to within school stratification. First, because the larger forms of social inequality and stratification are related to large societal inequities such as those based on class, race, gender, there is a substantial amount of research that analyses how each of the social inequities relate to educational stratification. Among that very large body of literature, within school stratification is often identified as a central mechanism for the maintenance of social inequities. Second, wherever there has been a focus on formally recognized outcomes (achievement scores, credential acquisition, attainment measures), there is also a focus on non-academic questions—often analyzed as cultural and social capital, or dispositions, norms and values. Here, the literature on analyzing the “hidden curriculum” a term coined by [Jackson \(1968\)](#), and later linked to class reproduction and ideological complicity by [Apple \(1971\)](#).

Early schooling and ability grouping

In many senses, within school stratification begins before children attend any schools. School readiness has been noted to be impacted by both access to early childhood education programs and the nature of those programs. While this has been a generally accepted view for many decades, over recent decades economists have been especially interested in early childhood and these programs have been identified as improving both academic and social and emotional behaviors through the provisions of systematic learning activities for children (see e.g., [Magnuson et al., 2007](#)). Within this broad pattern, however, children from disadvantaged families (living in poverty or with less-educated parents) are often less likely to attend early childhood education programs in

Fig. 1 Hypothesized pathway of within school stratification.

many national contexts, raising concerns that they are less prepared to start school than their more advantaged peers (see [OECD, 2020](#)). How schools respond to the known early childhood inequities becomes the basis of later within-school stratification processes.

For example, Curran, Little, Cohen Vogel & Domina (2020) examined Kindergarten readiness assessments used by schools to identify school and academic preparedness. Such information, they contend is utilized to support ability grouping practices. The basis of this concern stems from some of the earliest studies of ability group formation in primary schools where the interaction between school practices and students' unequal social backgrounds was brought into focus. The conceptual framework for this line of research was largely established well before the turn of this century. That is, although within-school stratification is typically associated with streaming or tracking in secondary schools, these studies of the earliest schooling have demonstrated processes that reinforce economic class differences, in the latter half of the 20th century, this was evident in the focus on the prevalent practice of grouping students by ability within classroom.

In the US, for example, the now classic studies of Ray Rist ([Rist, 1970, 1974](#)) documented how students in one urban elementary school were grouped in kindergarten and first grade by what the teacher understood to be ability—but that those groupings aligned with economic class differences between students. Students from lower socio-economic background were largely grouped into lower reading groups, whereas lower middle and upper-middle class students were assigned group membership into higher groups. The overall argument was that what the school and teacher understood to be a question of ability was directly related to background social class differences students had before they entered the school door. The main mechanism identified here was announced in the title of his 1970s article: the self-fulfilling prophecy, as reference to ([Rosenthal and Jacobson, 1968](#)). This important shift in Rist's analysis is that he showed how what was initially identified as a psychological phenomenon was a micro-level mechanism for larger macro-level social stratification. We should note that Rist's work built on earlier studies of primary school done within the Chicago Sociology tradition (e.g., [Becker, 1952](#); [Jackson, 1968](#)) as well as early US ethnographies of schooling ([Henry, 1955, 1963](#)). But this was not the only way of framing a corresponding analysis.

At the time when Rist's first studies appeared, students' social-linguistic differences were known to be a main means of recognizing social class differences, in the UK, the US and France. In the UK, the seminal work of Basil Bernstein and his colleagues had already documented class differences in language ([Bernstein, 1971, 1975a,b](#)), and in the US similar observation had been made in the early sociolinguistic work of ([Labov, 1966](#)). Bernstein and Labov were contemporaneous and later drawn into theoretical dispute on the degree with which either were committed to a so-called "deficit" view of language—but both had made clear links between differences in the use of English (both in cities where English was the dominant language) and economic class differences. There are two links within this work which should be noted. First, while language itself was the object of analysis in these studies, it was the underlying link to basic human cognition which made the connection to early school practices evident in the work of Aaron Cicourel and his colleagues ([Cicourel et al., 2014](#)). Second, this line of analysis led directly to an entire subfield of educational research. In the UK, the links between language and schooling sparked the early formulation of the New Sociology of Education ([Young, 1971](#)) and direct connections with the stratification of curriculum ([Bernstein, 1975b](#)). In the US this work was the early seeds of what became an immensely productive set of sociolinguistic analyses of school and the classroom, through the work of Courtney Cazden ([Cazden, 2017](#)), Bud Mehan ([Mehan, 1979](#)), and Shirley Brice Heath ([Heath and Press, 1983](#)). Methodologically, most of this work employed what became known as ethnomethodological studies ([Erickson et al., 1980](#)) wherein the connection between language and the larger social and political structures of society were evident ([Erickson, 1978](#)).

In France, similar studies relating to class reproduction and school had begun, most notably those led by Pierre Bourdieu. Translations of the work had begun around the time of their first publication (e.g., [Bourdieu, 1967](#)), but began to flourish in the Anglophone literature following the English translation of *Reproduction* ([Bourdieu and Passeron, 1977](#)) and continued well into the late 20th century ([Bourdieu et al., 1996](#)). Methodologically, these early French studies were largely what would now be called "mixed-methods", combining quantitative and qualitative empirical analyses. Theoretically they were very much informed by Bourdieu's own anthropological background, with an early focus on the socio-linguistic basis of cultural differentiation—in direct response to the heavy reliance on linguistic competence in the French educational system. Bourdieu's work on educational stratification was directed across all "levels" of systems—with a very significant focus on higher education, but here it is important to note that his earliest foray into analyzing educational stratification began from a focus on what linguistic differentiations reveals (see [Bourdieu et al., 1965](#)).

Beyond the focus on its sociolinguistic foundations, in the English language work, the interest in the impact of ability grouping in elementary schooling has also been a hotly contested terrain producing numerous studies—especially in reading and literacy. Major studies in this line of work often do not make direct links to wider questions of social stratification such as in the work Robert Slavin ([Slavin, 1987, 1993](#)), however the link between ability grouping was well noted as being in need of more study in England ([Francis et al., 2017](#)) just prior to Francis's ([Francis et al., 2019](#)) recent significant contribution to our overall understanding of the social impacts of ability-grouping. This recent work by Francis and her colleagues provides a nice summation of the various mechanisms identified in the literature on within-school stratification:

- misallocation to groups;
- lack of fluidity of groups;
- quality of teaching for different groups;
- teacher expectations of pupils;
- pedagogy, curriculum and assessment applied to different groups;

- pupil perception and experiences of “ability” grouping, and impact on their learner identities; and that,
- these different factors work together to cause a self-fulfilling prophecy (Francis et al., 2017 p. 4).

Notice these mechanisms correspond to three different domains: the structure of grouping students; the quality of what students experience within classrooms; and the subsequent psycho-social effects of these two main factors. This corresponds to the question of the effects of differential qualities within a given level of schooling and the issue of who gets stratified into what pathway at specific transition points.

The longevity of a research focus on understanding inadvertent ways that within group stratification makes its way into the early school years was examined by Burns and Mason (2002) who present findings about class formation in two groups/composite classes in elementary schools demonstrating that principals deliberately organized class arrangements for teaching purposes. The inadvertent side effect of such organizational practices was that “principals strategically robbed several single-grade classes of particular kinds of students to concentrate them in one combination class” (Burns and Mason, 2002, p. 227). Additionally, for children brought up outside the middle-class mainstream, differences between home and school are dramatic. “The conventions of the school, with its achievement orientation, its expectation that children will stay on task and work independently without close monitoring, its tight schedule of moving from lesson to lesson, its use of ‘network’ English, its insistence on punctuality, and its evaluation of children in terms of what they can do instead of who they are, all can be daunting” (Entwistle and Alexander, 1993, p. 405).

The recognition that organizational practices of schools play a role in how students develop from different social and economic backgrounds from the earliest years of schooling continues to motivate research to this day, with contemporary sociological analyses focusing on how parents’ own cultural capital plays a significant role in navigating student experiences of early schooling (Lareau, 2003; Lareau and Weininger, 2003) (inclusive of group placements), through to more technical questions of the impact ability grouping has on students from non-dominant cultural and linguistic backgrounds. The basic pattern of these more technical analyses (which grouping practices benefits whom) carries forward through the schooling years along two main axes. Overall the basic pattern suggests students from non-dominant backgrounds are more highly represented in lower “ability” grouping and that higher groups benefit from, or at least are not hindered by, that grouping; whereas lower group are typically hindered in terms of academic achievement and socio-emotional impacts (e.g., Lleras and Rangel, 2009; Catsambis and Buttar, 2012). It is important to note that this differs between subject areas of achievement and with specific second language students (Garrett and Hong, 2016; Robinson, 2008). It is also important to note that the impact of the grouping depends largely on how it is structured (size of group, for what length of time, what sort of pedagogical experience is offered within them) (see e.g., Hong et al., 2012). Interestingly, Stürup et al. (2017) have raised the prospect that socialization into stratified systems themselves is a consequence of some pre-school practices.

Transition into and out of primary schools

Key transition points in schooling have been significant in studies of within school stratification because of their important role in establishing achievement trajectories. Studies into school transition points also emphasize the complex interplay between children and young people’s home contexts and educational achievement, such as parent income, occupational status, education levels and educational expectations, as well as the levels of engagement between the family and the school.

The initial focus on early transitions into schooling has long been recognized as a crucial step in a much longer process of educational stratification, and within-class stratification has been among the many factors contributing to the formation of social strata. In a relatively early review of studies into school entry, Doris Entwistle and Karl Alexander point out that the logic of grouping students almost always is done with the intent of reducing heterogeneity within instructional groups, and that ‘instructional grouping is just one component of an elaborate apparatus for “educational sorting” that confronts children as they begin their school careers’ (Entwistle and Alexander, 1993, 413–414). Although with several out of school factors, the other school organizational practices identified by Entwistle and Alexander included sorting students into Special Education programs and holding students back (“grade retention”) before allowing them to advance beyond the first year of schooling. Through this mix of school organizational practices, according to Entwistle and Alexander, “educational stratification begins in earnest when children start their formal schooling or just before, at roughly ages 3–7. This is a ‘critical period’ in their lives, a special time, when for developmental/cognitive and social/contextual reasons they are especially responsive to schooling” (1992, p. 417).

Sociological studies in transition point allocations have traditionally focused on understanding the relative (and independent) contribution different background characteristics have on the probability of being allocated to one stratum or another (Kerckhoff, 2000; Lucas, 1999, 2001). The focus of such studies typically tries to tease out how much of that allocation depends on “educational” characteristics (most often prior achievement) relative to social demographic characteristics (most often race, economic advantage, gender). Studies in school retention or completion are the clearest examples of such allocation studies, of which there are numerous Australian exemplars at the post-compulsory level (see, e.g., Lamb, 2006). The differential pedagogical processes between strata are typically examined as potential contributors to subsequent achievement (or completion). In quantitative terms, the allocation processes are typically modeled in terms of the probability of specific allocation, and qualitative studies of allocations will focus on decision making, sense making, and choices made in the allocation process. Studies of within strata pedagogical processes ultimately lead to quantitative estimates of the effects of curriculum differentiation on future achievement or subsequent pathway allocations, and qualitative studies that link the nature of work, knowledge and subjectivity within strata with broader social stratifications beyond schooling. Current school research in Australia has focused almost exclusively on the last stage of these pathways and remains limited (as noted above).

The beginnings of various within-school stratification process such as negative evaluations and lower expectations from teachers, within and between class ability grouping, grade retention and special education classes all form part of educational experiences even in the early years of school. Entwistle and Alexander (1993) drew attention to educational stratification in the early years and transition school, identifying school transition as a “critical stage” in children’s development through the establishment of school achievement trajectories with school readiness identified in relation within school stratification processes in the early years. Duncan et al. (2007) highly cited work identified school readiness as having a lasting impact on school achievement and noted “math and reading skills at the point of school entry are consistently associated with higher levels of academic performance in later grades” (Duncan et al., 2007, p. 1444). Other work examining teachers’ perceptions of school readiness identifies a lack of academic skills as one of the central problems for children starting primary school by Rimm-Kaufman and Pianta (2000).

Dauber et al. (1996) in the first study to examine, middle school transition, noted that placements in higher tracked English and mathematics at the point of transition were better for children whose parents have higher levels of education and/or income (Dauber et al., 1996). The use of standardized test scores from the fifth grade were also a primary mechanism used for allocating students to a middle school track placement with test scores seen as an organizationally efficient method of making decisions regarding the class organization of students coming from several different feeder schools.

Curriculum stratification within secondary schooling

Basic issue and the comprehensive high school

The clearest example of within-school stratification occurs in secondary schools structured to deliver specific subject-based curriculum. The basic structure of using ability grouping within subject areas (e.g., having “top”, “middle” and “general” levels of mathematics classes) has been well established from the earliest secondary “colleges”. But that structure became a linchpin in the much more complicated organization structures created in the latter part of the 20th century, with the creation of the “comprehensive high school”. Calls for, and analyses of, the “comprehensive high school” date from the mid-1950s in both the US and UK (and beyond). Notable texts include the US post-WWII the call for comprehensive high schools to meet the expected expansion of secondary education—based on the promise of opportunity (Conant, 1959), and a later analysis led by the same Harvard University President, James Conant (Conant, 1967). In a parallel development, the UK was also developing and analyzing a similar expansion of secondary education, albeit from a rather different historical system of examinations for selection into secondary ‘public’ colleges and academically oriented “grammar schools” (see, e.g., Floud and Halsey, 1956).

The rationale for the development on both sides of the Atlantic (and throughout the Anglosphere), was constructed within the now well-known logic of meritocracy—opening entry into secondary schooling to all students with the promise of educational opportunities within a system designed to maximize the productivity of a full range of talents and skills, beyond traditional academic foci. The crucial question was when in a student’s life is it most efficient to provide differentiated educational pathways for different parts of the population. Where separate schools for education of students seen to be destined for vocational occupations were part of the larger systems since at least the turn of the 20th century, the comprehensive high school was designed to delay that differentiate by providing both academic and vocational education under one roof. As Floud and Halsey explained:

The most radical inference (of their analysis) is that English secondary education should be reorganised along the comprehensive lines. There is indeed something to be said for the view that the common secondary school is best suited to the needs of a technological society – least likely to stand in the way of free vocational choice and movement, most likely to produce the maximum supply of skilled and responsible individuals particularly in the middle ranges of the occupational structure.

Floud and Halsey (1956, p. 89).

The congruence of the comprehensive high school and the growth of policy rhetoric based in meritocracy was by no means contained to English speaking countries, as has been noted by a wide range of scholars in comparative education studying world systems of schooling. (e.g., Griffiths and Millei, 2012).

Thus, the terms of debates about within-school stratification were set from the inception of comprehensive high schools. What are within-classroom distinctions in primary schooling in the formation and use of ability-grouping became part and parcel of what became a dominant form of secondary schooling in the US and UK, at least until the late 1980s rise of school choice policies. That is, rather than grouping students within individual classrooms, secondary schools grouped students based on prior achievement (often conflated with an unexamined notion of “ability”), so that each class was seen to be relatively “homogenous” compared to the alternative mixed ability classes, known as “heterogenous grouping”.

In the US, debates on within-school stratification reached a watershed moment with the 1985 publication of Jeannie Oakes’ *Keeping Track: How Schools Structure Inequality* (Oakes, 1985). Building on data from a very large study of American secondary schools (Goodlad, 1984) in that work, and similar concurrent large studies of high schools (Boyer, 1983), Oakes presented a detailed and systematic analysis of how tracking practices related to larger dynamics of social and economic reproduction of the educational inequalities of economic class and race. Within the overall argument, Oakes focused on the major differences of educational experiences between tracks—paying particular attention to the lived experience of students in terms of what knowledge

each track taught, the forms of pedagogy taken within different tracks, the subsequent student attitudes, differences in classroom climate and the special case of vocational education. Effectively Oakes brought together both the selection mechanisms (or transition points) used to direct students into and out of tracks, and the internal quality of what student experience within tracks over time. One crucial point of this analysis was how individual decisions about small shifts or seeming details of management combine over time into a larger system creating the social inequality of the larger US society.

Two ongoing definitional debates lay behind the specifications of the dynamics Oakes revealed. First, how the specific forms of grouping can work in widely different ways, from entire year levels of students in a school being grouped into different class levels and then given entirely separate class schedules for each track or stream, through to ability grouping only applying to individual subjects and any subsequent grouping being due to students' selection or timetabling constraints. The distinction between these forms of tracking and streaming eventually developed its own technical nomenclature—in this case between tracking *de jure* v. *de facto* tracking (e.g., Lucas and Berends, 2002). Second there has been ongoing need to specify definitions as patterns of within school-stratification that have been identified with differing terminology—initially by the term “tracking” (mostly used in US nomenclature) and “streaming” (most commonly used in British studies).

Since *Keeping Track*, the overall trends of critical studies on streaming and tracking largely focus on two main lines of critique. On the one hand, there are many studies which question whether or not prior achievement is actually the main driver of which students get selected into which group, with many studies identifying disproportionate distribution of students based on social factors, including socio-economic status, race and gender (Oakes and Guiton, 1995). Studies of the probability of different social groups being more or less represented at different levels of within school systems of stratification are now widely globally dispersed, typically attempting to differentiate how much of those decisions are due to measurable prior achievement as opposed to other “exogenous” factors. Consequently, there are many studies debating the degree to which social inequality is implicated in any one system point. But when building from the insights of individual transitions into larger systemic analyses, the focus on divergent life pathways through schooling have been very clearly linked to socially stratified pathways into adulthood, both in the US (Kerckhoff, 1993) and the UK (Kerckhoff, 2019).

From an organizational perspective, the impact of tracking has been specified in greater detail. Gamoran (1992), for example, differentiated and tested the impacts of “four structural characteristics of tracking systems: selectivity, electivity, inclusiveness, and scope” (Gamoran, 1992, 812), as a means of explaining “variable effects” of tracking. That is, by the time of that analysis, studies into the impacts of tracking had revealed differing patterns from different studies, leading Gamoran to question which forms of tracking had which effects. Of prime focus for this earlier specification were differences that had been found between public and Catholic high schools in the US. Gamoran's (1992) analysis is especially notable because he not only specified patterns of effect, but also provided clear articulation of the plausible mechanisms leading to those effects. Consistent with much earlier work, the simple organizational design of tracking was seen to trigger several socio-psychological responses of students, akin to Rists's earlier elaboration of the “Pygmalion” effects that result from intra-group identification processes, where tracking was shown to create polarization between students in terms of their fit with academic demands of schooling. The crucial dimension here is to see that while “ability grouping” is a primary organization feature of tracking systems, the organization question is what form that ability grouping takes over time, and across subject areas (essentially the more static the grouping, the more notable its impacts).

This social-psychological phenomenon has since been the focus of a large body of research related to Herb Marsh's work on the generation of the academic self-concept of students and its later impacts. Formulated as the “Big-Fish-Small Pond” (BFSP) effect, Marsh and his colleagues have produced several studies demonstrating that students moving from smaller settings in which they are ranked academic high, into larger structures where they might no longer be top in class can negatively impact a student's academic self-concept (Marsh and Hau, 2003; Marsh et al., 2007). Importantly this work has been shown the BFSP effect to be multinational, and, in the more recent work of Parker, to be related to the degree of stratification within national systems (Parker et al., 2021, 2016, 2018).

The second line of analysis following *Keeping Track* that Gamoran (1992) began studying carefully focused more closely on the curricular experiences of students between transition points, within the classrooms structured by the stratifying effects of tracking. That is, in addition to the social-psychological impacts of tracking, Oakes' argued that significant differences develop in terms of the academic quality of teaching between tracks (Oakes, 1985), and Gamoran later confirmed this to be both true, and a factor in the noted consequent achievement gaps that develop between tracks (Gamoran, 1996; Gamoran and Mare, 1989; Gamoran et al., 1995). This line of analysis was informed by earlier studies of the ways in which teachers adjust teaching to specific contexts (such as in McNeil's *Contradictions of Control* (McNeil, 1986)), and its central tenet has been re-confirmed many times, (e.g., Carbonaro and Gamoran, 2002), as a partial explanation for the unequal achievement impacts of tracking.

In an overall analysis intended to inform policy, Gamoran has developed the argument that when judged in terms of overall achievement (average achievement per cohort), tracking can be shown to be less productive the more rigid and static the stratification of tracking becomes. This line of reasoning builds from the common finding that lower track placement have persistent negative impacts on students, while evidence of any benefits on top track placement has been much more mixed (Oakes et al., 1992). The question raised by an analysis of “productivity” is whether or not there are other, more effective means of grouping students (Gamoran, 2011).

This search for effective alternative systems of organizing high school instruction, in the US, has followed from the research documenting the negative consequences of tracking (Oakes and Lipton, 1992). That quest remains an ongoing question, and a source of frustration for many school reformers. After all, recognizing negative impacts of an organization is not the same as consciously

transforming organizational practices, and this later endeavor opens the larger attempts to reform or restructure schooling. For our purposes here, however, it is important to recognize that endeavor largely remains as yet unfulfilled (Gamoran, 2011).

Within-school stratification internationally

Outside of the voluminous address of within-school stratification research in the US, quite similar lines of analysis have developed in the UK. Dating to the early analyses of comprehensive high schools noted above, the specific interest in UK “streaming” was placed well and truly on the agenda by the early work of Stephen Ball. Ball (Ball, 1981) had developed a case study of one high school in an analysis that roughly parallels Oakes’ more generalized work from the same time period. Interestingly, however, it has only been in the last couple decades that strong empirical research has investigated within-school tracking in the UK in any further depth. Much of this UK work has been produced by Diane Reay (Reay, 1999a,b, 2004, 2007), and several other British colleagues (e.g., Connolly et al., 2019); including addressing the lack of impact of that research on policy (Francis et al., 2017). It is important to recognize that long term stratified student grouping practices do vary substantially between systems. The case of England makes this very clear where streaming practices have been documented to occur earlier than in many US systems (Taylor et al., 2022). Note here, that differences in nomenclature include the English use of the term “attainment” to refer to what is typically referred to as “achievement” in most other parts of the world. English attainments are levels of achievement on exams.

Like Oakes, much of the UK work, especially that by Reay, has come to the question of within-school stratification from a broader sociological interest in the lives and prospects of working-class families and children. This link between large societal level inequalities and academic organizational practices does remain contested by those who believe academic achievements can be readily separated using conventional statistical modeling. Examples of this latter concern largely attempting to differentiate prior student characteristics from the ostensible more justified notions of student cognitive ability (e.g., see Marks, 2013), as if statistically independent variables do represent independent social dynamics. That debate directly links to larger questions related to questions of meritocracy.

This conditioning of the impacts of within-school tracking/streaming is directly related to between school differences across several countries. In many parts of the world, including the UK, there are substantial school differences related to larger systems of student “choice” models, the uses of within school stratification varies substantially between schools (Taylor et al., 2022), and in many nations those between school differences can be related to differences in public and private systems, as they are in Australia (Perry and McConney, 2010; Perry and Southwell, 2014; Rowe and Perry, 2020). It is very important, also, to note that in many other parts of the world, streaming students into stratified groupings has largely gone uncontested until very recently (Johnston and Wildy, 2016; Liu et al., 2005; Wang, 2021). Whether or not any one system substantially shifts from the use of within-school stratification successfully remains to be seen.

Thus, while the amount of research emanating from the United States on within-school stratification is disproportionate to other nations, there is little reason to believe the general phenomenon is no less an issue wherever the practices are found. The inclusion of measures of differing types of student grouping has allowed substantial international work to develop, but the global picture remains less systematic than might be possible. To date, our capacity to develop such a more global model is, at least for conventional statistical models, limited simply because of a lack of measures. As Parker et al. (2021, p. 344) put it:

To our knowledge, no internationally comparable database allows for between country comparisons in between-school versus within-school tracking. As such, the relative relationship between ability stratification and tracking at these respective levels does not yet seem possible, but it is an important research topic when such data do become available.

That said, from the perspective of larger systems of educational policy and its link to broad social and economic impacts of education, the role of within-school stratification faces a dilemma:

‘Overall school tracking has an ambiguous effect in our sample of countries. On the one hand, and consistently with the previous literature, tracking has a detrimental impact on educational attainment, because it prevents some individuals from further progressing to the tertiary level of education (the diversion effect). On the other hand, the curricula offered in vocational schools seem more effective in promoting further training and adult competences (the specialization effect), thereby reducing the impact of parental background on these two outcomes. Thus, reducing the extent of student tracking, either by raising the age of first selection or by reducing the number of tracks available, may be appropriate for increasing inter-generational mobility in educational attainment, but may increase social exclusion for people from disadvantaged backgrounds.

Brunello and Checchi (2007).

This brief summary notes the special case of vocational education in the overall patterns by which schools reproduce existing economic class differences, a topic worthy of its own address. Here, however, it raises a larger question about just which outcomes schools are intended to serve. In the case of conventional academic achievement, however, there is little doubt that within-school stratification carries substantial negative impacts for those on the bottom of that hierarchy, and lower overall educational “productivity”.

Introduction: The context for inclusion for all

Inclusion for all has been a global aspiration, formalized through the Salamanca agreement (UNESCO, 1990). It aligns with the United Nations Convention on the Rights of the Child (UNICEF Office of Research, 1989) and with the United Nations Goals for Sustainable Development to be achieved by 2030 (UNICEF Office of Research, 2017; 2019b). It also aligns with a drive to ensure equity for all children, brought into sharp relief by the Covid-19 pandemic which has brought to the fore, and exacerbated, existing inequalities and inadequacies in the support for children with mental health issues and Special Educational Needs (SENs).

Globalization and the neo-liberal agenda

Within the complex and unpredictable world in which we live, it is crucial to understand the forces that shape and drive educational policy across the world, particularly as the locus for policy-making shifts from the national to the supranational (D'Agnese, 2018). Global organizations such as the Organization for Economic Cooperation and Development (OECD) and the World Bank play a key role in shaping the political agenda. It cannot be denied that much valuable work in addressing inequality across the world has been undertaken by such organisations. It could be argued, however, that, through the power invested in and resources available to them, they are able to set and dictate the agenda.

Increasingly, there are voices of dissent with many commentators critiquing the neo-liberal agenda that frames the values underpinning and context for action – the focus on performativity, marketization and the commodification of education (Ball, 2003; 2015; Connell, 2013; D'Agnese, 2018). This can be seen very clearly in England where there is a plethora of different forms of schooling (Comprehensive, Free, Faith, Grammar and Private Schools, Academy Trusts and City Technology Colleges). Schools compete with each other to attract students who are most likely to enhance their reputation, leading, almost inevitably, to

exclusionary practices for children who are deemed to not add value to the school (Ainscow, Booth and Dyson, 2006a; Slee, 2018b). Thus, children, themselves, become commodities.

This neo-liberal agenda is also evident in the OECD's global standardized tests (such as the Program for International Student Assessment – PISA), leading, ultimately, to a reification of performance in a narrow range of competencies (with little consideration of cultural context) and practices such as teaching to the test (Ball, 2003; 2015; Ball and Noddings, 2014; Clapham et al., 2016; D'Agnesse, 2018; Holloway and Brass, 2018; Moore and Clarke, 2016; Solomon and Lewin, 2016).

What emerges from OECD documentation is a narrative of risk, creating a mandate for change, in which key terms, such as excellence, are rarely defined and key concepts, such as social justice and inclusion, are understood in very restricted and reductionist ways (Mowat, 2018). There is a failure to recognize competing policy imperatives and to recognize that the neo-liberal agenda through which policy is both formulated and enacted and the emphasis on performativity inherent within this almost inevitably create the conditions under which some children will fall by the wayside (Apple, 2001; MacBeath et al., 2007), marginalizing children who are already disadvantaged.

Children's rights and Education for All

The Salamanca Statement and Framework

The *Salamanca Statement and Framework* (UNESCO, 1990) represents one of the key landmarks in the quest for inclusive education, bringing children's rights to the fore. It challenged the orthodoxy at the time that not all children should be educated in regular or mainstream schools; it called for major restructuring of the school system; and it raised consciousness of inclusive education (Flores, 2019), creating a mandate for change (Ainscow et al., 2019). Subsequent to Salamanca, a range of policy initiatives has taken this agenda forward globally from *Education for All* (UNESCO, 1990) to the recent reports emanating from UNESCO (Slee, 2018a; UNESCO, 2017).

United Nations Convention on the Rights of the Child (UNCRC) and Education for All

Two further critical developments have been the UNCRC which through 54 articles sets out the civil, political, economic, social and cultural rights for all children (UNICEF Office of Research, 1989) and the *Education for All* movement. *Education for All*, launched by UNESCO in 1990 and taken forward through the work of UNICEF and organizations such as the World Bank (*Learning for All*), is informed by a human rights perspective and is concerned with increasing access to and participation within education across the world. It seeks to address the two hundred-and-sixty-three million children and young people who are debarred from schooling, fueling intergenerational poverty and disadvantage and robbing their communities of economic growth (UNICEF Office of Research, 2019a).

The Sustainable Development Goals (SDGs)

Building on the earlier developments, the seventeen *Sustainable Development Goals* (UNICEF Office of Research, 2017; 2019b) provide a global framework for addressing key international imperatives including those most pertinent to children, such as ensuring access to quality education, good health and wellbeing and eradicating poverty and reducing inequalities.

The impact of inequitable societies on children's wellbeing and life chances

As has been ascertained, even prior to the pandemic, equitable access to schooling across the world is far from a reality for a vast number of children. Even in more advanced nations, where access to education is less problematic, inequities in the experience and outcomes of schooling abound. The poverty-related attainment gap persists over time, having a lasting impact on life opportunities, such as access to Further and Higher education (OECD, 2018; UNICEF Office of Research, 2010).

This is reflective of broader inequalities in society. Putnam (2015), in his exploration of the demise of the "American Dream," demonstrates an increasingly divided society where the social and economic distance between the "haves" and the "have nots" has widened over time. It is not just children from low-income families who are impacted negatively by inequality. On a range of measures relating to education, health and life satisfaction, the outcomes for children are poorer in more inequitable societies with unequal income distribution, irrespective of family wealth (UNICEF Office of Research, 2016; 2017; Wilkinson and Pickett, 2010).

Amidst rising concerns about the prevalence of mental health issues in society in general, increasingly, concerns are raised about the mental health and wellbeing of children and young people with, at times, devastating consequences (Bruckauf, 2017; Patel et al., 2018; World Health Organisation, 2016). There are particular concerns around the mental health of adolescent girls, a growing trend in many recent surveys (Bruckauf, 2017; OECD, 2017a; 2017b; Patalay and Fitzsimons, 2018). In the UK, over a two-year period, the subjective wellbeing of young people aged 10–15 decreased significantly (The Children's Society, 2020). Those children living in the poorest families fare worse and have the poorest health outcomes. This is more acute for adolescent girls than boys (UNICEF Office of Research, 2016).

There is an indirect relationship between poverty and poor subjective health related to structural inequalities in society which impact on family affluence, limiting children and young people's access to material resources and creating stressors in their lives (UNICEF Office of Research, 2016). Long-term poverty impacts negatively on infant and childhood mortality, poorer child health and incarceration (Cooper and Mulvey, 2015; Mowat, 2019a).

While much of the above is beyond the direct control of schools, these are the realities that schools and their leadership teams face on a daily basis and is crucial to our understanding of how to build sustainable, inclusive school communities.

The impact of the pandemic on children's education and mental health and wellbeing

As previously intimated, the pandemic has served to exacerbate existing inequalities. This impacts on communities, families and individual children.

A state of precarity

Precarity is understood in the social sciences and humanities as an effect that arises from neo-liberal practices, particularly related to work that is temporary, insecure, poorly paid and sporadic in nature. It not only impacts on levels of poverty within communities, but on the day-to-day life of people – their health and wellbeing, manifest in crime-rates, pupil indiscipline, mental health issues, gender inequalities and discrimination, among many other things – and it is these relationships that the concept seeks to capture (Kirk, 2020).

While one might imagine that the financial impact of the pandemic would be experienced similarly across the UK as many people have had to rely on furlough payments, grants and loans from the government and welfare benefits, a report from the financial firm Lane, Clark and Peacock LLP (Lane et al., 2021; Peachey, 2021) indicates that this is not the case. Indeed, six million employees have become “accidental savers,” squirreling away thousands of pounds that otherwise would have been spent on work-related expenses, holidays and leisure activities. Thus, the differential in disposable income between the “haves” and the “have nots” has widened, exacerbating existing inequalities and putting more families into poverty and debt.

In the UK, families who, prior to the pandemic, were on low incomes and who faced the greatest constraints and instability had fewer resources to draw on to help them to “weather the storm.” In particular, those families who were already facing significant disadvantage and who experienced sudden job loss, reduction in hours and had insufficient budget to cover additional costs were particularly affected (Hill and Webber, 2021).

In Scotland, families who were already reliant on welfare benefits reported that their financial situation had worsened and debt increased. 82% of these families had experienced deterioration in their mental health over the course of the pandemic. A key concern for them was support for their children, including helping them to deal with mental health issues (Incudem, 2020). The Child Poverty Action Group (CPAG) found that families were more anxious about finances than prior to the pandemic and 90% were spending more on household bills during lockdown when children were at home. Schools had sought to ameliorate the negative impact of Covid-19 on families, alleviating financial pressure, communicating with parents and children and young people and supporting home learning and the social engagement of children and young people (Child Poverty Action Group, 2021).

Covid-19: the learning and digital divide

Access to schooling

In the eleven months from March the 20th, 2020, more than 168 million children globally were not in attendance at school, representing an average of 95 days lost (United Nations Children's Fund, 2021a). During this time, 214 million children from pre-primary to upper secondary missed at least three-quarters of classroom instruction. The duration of school closures varied significantly between different countries (UNESCO, UNICEF, and the World Bank, 2020; United Nations Children's Fund, 2021). In the period July–October 2020, 31% of the days missed were accounted for by children living in low-income countries in comparison to 14% of children living in high-income countries. Low- and lower-middle income countries were significantly less likely to monitor student learning. When schools did re-open, high-income countries were more likely to adopt a form of blended learning (UNICEF and UN Women and Plan International, 2020).

In the earlier stages of the pandemic, significant differences emerged in the experiences of children attending private, as apart from state, schools in England and in the experiences of children coming from middle-class rather than working-class homes (Cullinane and Rebecca Montacute, 2020). This affected many aspects of children's learning, such as the frequency and regularity of communication with teachers; access to online learning; the degree of satisfaction with support from the school; the confidence of parents to support home learning (related to the level of education of parents); the amount of time devoted to learning; and the amount and quality of work received by teachers. The authors caution that, without measures taken to mitigate the impact of loss of learning for children in disadvantaged communities, the attainment gap will widen even further and the prospects for social mobility dim.

A range of approaches is being adopted globally to mitigate the negative impact of interruptions to schooling, among which are increase in class time and accelerated and remedial programs (U. W. a. P. I. United Nations Children's Fund and UN Women and Plan International, 2020).

The digital divide

Globally, those countries that had the longest period of school closures also tended to have the lowest proportion of children with a fixed internet connection which would have facilitated home schooling (United Nations Children's Fund, 2021). It has been established that 65% of children and young people, under the age of twenty-five, lack internet-access at home. This is dependent on locale and socio-economic circumstance (United Nations Children's Fund and International Telecommunication Union, 2020).

Children living in conflict areas, from rural communities and those children living in poverty were least able to access the technologies that enabled remote learning, exacerbating the impact of the existing digital divide (UNESCO et al., 2020).

Two out of three of the most affluent countries provided free or subsidized access to the internet, but this was not the case in less prosperous countries. Children living in the higher income band countries were also more likely to be in receipt of subsidized or free devices to support online learning. Not surprisingly, remote learning was considered to be much less effective than face-to-face teaching in low-income countries (only 20% considering it to be sufficient, in contrast to 86% in high-income countries) (UNESCO et al., 2020).

In Scotland, a year into the pandemic, 35% of families on low-income were still missing essential resources to support learning, such as laptops, tablets and printers. Even when devices were available, the software was not always compatible with school systems. Children in receipt of free school meals were more likely to have to share devices to access learning with family members and to use a mobile phone to complete schoolwork (Child Poverty Action Group, 2021).

The risks posed to children with disabilities

The pandemic has undoubtedly had a disproportionately negative impact on disabled children across the globe. In particular, the stigma and associated discrimination toward disabled children often leads to increased exposure to abuse and neglect which, together with restricted access to services (health and social care) brought about by Covid-19 restrictions, leads to the magnification of social inequalities. Over 80% of countries in Eastern Europe and Central Asia reported disruption in access to disability-related health services and 25% to social services. At least half had not put in place measures to facilitate learning for disabled children and disability-inclusive responses to the pandemic were largely inadequate (with a few exceptions) (United Nations Children's Fund, 2020a).

In the absence of support networks, the anxieties and depression induced by lockdown conditions may compound existing mental health issues. For some children with intellectual or psychosocial difficulties, coping with disrupted routines may be particularly challenging. The shielding or quarantining of disabled children may place increased pressures on family life, potentially exposing them to the increased risk of violence in the home. Home schooling for all parents and children can be difficult but, without the assistive devices and specialized curricula that support learning for disabled children, it can be particularly challenging (United Nations Children's Fund, 2020a).

Covid-19 and child protection

Globally, Covid-19 has posed significant challenges with regard to protecting children from neglect, abuse and violence. Increased risk may arise from loss of care for children due to family bereavement, illness or separation; the stressors on family life arising from financial insecurity (as previously discussed); and increased care-giving responsibilities at a time when family supports are reduced. This is compounded by disruption to normal child protection processes and procedures, leaving many families and children vulnerable. The lack of contact with families and children due to the imposition of lockdown has made it more difficult for teachers and those who come into contact with children to pick up the signs of neglect and abuse, leading to a reduction in referrals to child protection services (United Nations Children's Fund, 2020b).

Previous pandemics and world conflicts have led to disruption of services and Covid-19 has been no exception with welfare services (48%); violence prevention programs (49%); case management services/referral pathways (52%) and household visits to children and women at risk of abuse (53%) affected. The United Nations advocates that child protection services should be designated as essential work with governments prioritizing critical prevention and response services to protect children from violence (United Nations Children's Fund, 2020b).

Thus, it can be seen that, across the world, children and young people have been marginalized in many different ways with significant impacts on their lives and life-chances both pre- and post-pandemic.

Inclusion for all

The discussion to this point has set the context for the discussion to follow, highlighting the scale and complexity of the problem to be overcome. The next part of the discussion will focus on building inclusion for all, exploring initially how the concept is understood and the inherent tensions and dilemmas relating to it.

Inclusion – a “slippery,” contentious concept

On the 25th anniversary of the signing of the Salamanca Statement, commentators still draw attention to the ambivalent, paradoxical nature of the construct and the controversy associated with it (Corcoran et al., 2019; Kinsella, 2020; Larsen et al., 2019; Slee, 2018a); controversy captured within the heated debates about the place of special schooling; models of disability; and ableism/disablism within the field of critical disability studies (Norwich, 2013; Shakespeare, 2014).

It has been argued that how inclusion is understood and put into practice must take account of geo-political factors, culture and context (Slee, 2018a). Across the developing world, where there is conflict, poverty and displaced populations, the challenges in achieving inclusion for all are significant (Ainscow and Sandill, 2010; Slee, 2018a). What may “count” as inclusion in the context of developing nations (for example, separate provision for children who are disabled) could potentially be construed as exclusionary in more developed nations (Florian, 2019).

The typology of inclusion developed by Mel Ainscow and colleagues (Ainscow, Booth and Dyson, 2006a) identifies six ways in which inclusion is commonly understood. These range from a narrow conceptualization as pertaining solely to disability and children with SEN to a much more embracing *principled approach to education and society* – a values-led approach, concerned with the promotion of equity, participation, community, compassion, respect for diversity, sustainability and entitlement. Such an understanding moves the focus away from more restricted understandings of inclusion as being primarily about children with disabilities (Florian, 2019). However, Norwich (2013) cautions that the latter conceptualization could lead to an over-simplification of the differences between different facets of diversity with the needs of children with SEN being subsumed within other categories.

Inclusive education

Norwich (2013) argues that there is no single, commonly agreed understanding of what constitutes inclusive education, resulting in ambiguity around its realization. It is conceptualized in a multiplicity of different ways as being concerned with: accepting/valuing/ extending scope to all; equal opportunities; voice and empowerment; a never-ending journey; and/or as a means toward an inclusive society.

In contrast, Loreman (2009) maintains that inclusive education has commonly agreed distinctive features, such as a recognition that all children should follow substantively similar programs of study while in attendance at their local school, with appropriate modifications made to curricula. Florian et al. (2017), concerned about the “repetition of exclusion” (p. 695) represented within separate provision for children with SEN, suggest that, rather than offering separate pedagogies for individual groups of children that could potentially stigmatize them, inclusive education should, instead, focus on extending and making accessible the provision which is on offer to children of a similar age within the classroom setting.

These differing perceptions lead to tensions within the field, manifest within the controversies surrounding special education; the extraction of children from the classroom for additional support; and the concerns around the stigmatization and labeling of children (Hornby and Evans, 2014; Mowat, 2015a; Slee, 2013). Norwich (2013) draws on the earlier work of Minow (1990) to elaborate on the “Dilemma of Difference” encapsulated in the following two questions – “When does treating people differently emphasize their differences and stigmatize or hinder them on that basis? And when does treating people the same become insensitive to their difference and likely to stigmatize or hinder them on that basis?” (p. 7).

A further tension lies in the relationship between inclusive education and SEN. While the Warnock report on SEN in England (Department for Education and Skills, 1978) initially led to a transformation in how children with disabilities were understood and educated, extending in influence within and far beyond the UK, ultimately, it led to the reinforcement of categories of impairment and disability (Slee, 2018b), represented in subsequent government reports (Norwich, 2013).

It has been argued that there has been a blurring of the distinction between the concepts of inclusion and SEN (Florian, 2019; Slee, 2018a) with the language of inclusion being appropriated by the latter (Slee, 2018b). Florian (2019) questions the degree to which SEN can be considered to be part of the solution or part of the problem in achieving an equitable education system.

Models of disability

Those who are advocates for inclusive education argue for a transformation of schools and their policies and practices rather than a focus on individual difference and deficit (the Individual/Medical/Deficit (IMD) model of disability), paying insufficient attention to the social, cultural and environmental aspects which act as a barrier to participation in society. They draw on the ideology underpinning the social model of disability (Oliver and Barnes, 2012) which makes a distinction between impairment and disablement and focuses on removing barriers to participation and learning, represented within the Index of Inclusion (Booth and Ainscow, 2011) which has exerted considerable influence across the world.

It is argued that the reification of what it is to be able-bodied (“ableism” – a key tenet of critical disability theory) together with the social imposition of restrictions on the lives of disabled people and the undermining of their socio-emotional wellbeing is a form of oppression and discrimination which is culturally situated (Slee, 2018b; Thomas, 2007).

However, while recognizing the many benefits of the social model in ameliorating the discrimination that many disabled people experience in their lives, Shakespeare (2014) argues that the alignment of the social model as a progressive approach to disability and the IMD with everything that is bad is an over-simplification of a complex interaction of the many factors which come together in the life of a disabled person – biological, psychological, cultural and socio-cultural – which cannot easily be extricated from each other. For him, the social model does not provide a full explanation for or encapsulate their life experiences.

Who's in? Who's out?

On a global basis, there is little consistency in terms of how SEN is understood and enacted and a lack of international coherence in the provision for children. The only common features appear to be that children so identified are marginalized and that “special provision” constitutes something that is additional to that which is on offer for other children (Rix et al., 2013). Likewise, Hardy and Woodcock (2015) found little commonality internationally in how inclusion is understood and enacted within public policy, finding a policy landscape characterized by fragmentation, incoherence, inconsistency or discrimination.

A range of commentators draw attention to the disproportionality of children identified with SEN across the world, with some specific groups over-represented – principally children from ethnic, racial and immigrant populations (Dyson and Kozleski, 2008; Slee, 2018b; Tomlinson, 2016) and those living in poverty (Mowat, 2019a, 2020; Slee, 2018a). These structural inequalities are sustained and recreated through the systems, structures and policies of government (Dorling and Tomlinson, 2016).

Despite the frequent claims by the OECD that the pursuit of excellence and equity can go hand in hand (Schleicher, 2014), many commentators are concerned that the neo-liberal agenda underpinning such efforts and the unrelenting focus on “excellence” and market competition lead, almost inevitably, to exclusionary teaching practices across the world (Razer et al., 2013); to “winners and losers” (Barton, 2019); barriers to participation for those children considered not to “add value” (Ainscow et al., 2006b); and “hidden” as well as actual exclusions from school (McCluskey et al., 2019).

Slee (2018a, 2018b and 2019) is deeply concerned about the exclusionary nature of much education provision throughout the world and the reproduction of inequalities that it represents, reinforcing privilege and exacerbating disadvantage. In particular, he draws attention to the exclusionary clauses in education policy relating to children’s rights; the creation of educational élites; the ever-expanding categorization of disabilities (as exemplified in the *Diagnostic and Statistical Manual of Mental Disorders (DSM – 5)*); and exclusionary practices masquerading as inclusive education. Rather than schools being places of belonging for all children, schools have become a place for some but not all children (Slee, 2019). He questions whether schools have truly transformed themselves or “has special education relocated itself in the regular school?” (Slee, 2018a).

A recent article in *The Guardian* newspaper (J. Harris, 2021), drew on the experiences of a young person being placed in a “Reflection Center,” described by the headteacher as, “Quite a welcoming room where the students have an individual teacher supporting them”, but described by the student as being placed in a booth where, “you can’t talk to anybody, you can’t stand up if you don’t ask. Literally, it’s like being in prison” (p. 33). This experience is far from unique – similar experiences have been recounted by other commentators (e.g., Riley, 2017; Riley and Rustique-Forrester, 2002).

Slee (2018a) identifies four questions that should inform the development of inclusive education and which cut to the heart of the matter:

- What kind of world do we want our children and young people to live in?
- What kind of schools and classrooms are required to achieve that world?
- What do children need to know, think and be able to achieve a more inclusive world?
- When we look at our schools – who is in, who is out, who decides and what are we going to do about it? (p. 9)

Inclusive education: a reconciliation

It will be evident from the discussion to this point that the various perspectives that have been forwarded cannot easily be reconciled. A key tension is the degree to which inclusion can be seen to be limitless (i.e., any boundaries placed around the concept are seen as exclusionary). Some commentators are unequivocal in their view that there should be no limits to inclusion, with any boundaries around the concept being seen as discriminatory (Slee, 2018b). In contrast, Shakespeare (2014), while recognizing the benefits of the removal of barriers to participation and inclusive provision, believes that, for some children, alternative forms of provision may meet their needs more effectively. Florian (2019) argues that, in a post-Salamanca era, the key focus should be on valuing diversity, recognizing the uniqueness of each individual and their shared humanity: it becomes “an imperative of practice” rather than a secondary consideration (p. 701).

Inclusion can only be fully understood when consideration is given to its alter ego, exclusion – what it is that one wishes children not to be excluded or marginalized from. Likewise, marginalization and exclusion can only be fully understood when one gives consideration to what it is desired that children should be included within (Mowat, 2008), as per the questions posed by Slee. These, clearly, are value-positions that will be determined by cultural norms and the worldviews of people individually and collectively. As reflected in Slee’s last question (When we look at our schools – who is in, who is out, who decides and what are we going to do about it?), questions can be posed about who determines what might constitute inclusive or exclusive practice and by which criteria.

On the basis that a society cannot be truly inclusive unless it is tolerant of practices of which it disapproves, Hansen (2012) argues that “inclusion presupposes exclusion” (pp. 93–4):

So, it is not possible to consider inclusion in itself by excluding its otherness: exclusion, neither by defining a normative limit to inclusion nor by avoiding limits and making it unambiguous. From this point of view, it will never be possible to put meaning into the concept of inclusion without its otherness, exclusion.

She identifies a gap between the vision and rhetoric of inclusion as a limitless principle and practice on the ground: a gap that is not theorized or reflected within the concept. Any perceived failings are explained in terms of external factors – for example, IMD explanations; theories of stigma and marginalization, leading to a failure to critique the concept itself. In her view, how inclusion and exclusion are seen is dependent on the interpretation of the individual, shaped by the professional identities of teachers and the discourse surrounding their practice: “... inclusion or exclusion are dependent on how the professional constructs the specific situation and needs of a specific child” (p. 96).

Rather than seeing inclusion and exclusion as being polarities at opposite ends of the spectrum, might it not be more helpful to see them as lying on a continuum? – not as absolutes but as social constructs that are in a constant dialectical relationship with each other. This position recognizes that there may be boundaries between inclusion and exclusion, but these

boundaries are in a constant state of flux. They are influenced not only by the situated nature of the context but by the interpretation of the professional and the subjective experience of the individual child – how they see their world. What may be experienced as inclusionary or exclusionary by one child may not be experienced in the same way by another; what may be perceived by others in the life of the child as being inclusionary or exclusionary may not be experienced by the child in this way (Messiou, 2012b; Mowat, 2015a, 2015b); and, as argued by Florian (2019), what may be regarded as inclusive practice in one society may be regarded as exclusionary in another. Ultimately, it comes down to the interaction between what is valued by the child and family and what is valued by society, and what society affords, and this is socially, historically and culturally determined (Mowat, 2015b).

The boundaries between inclusion and exclusion and between inclusive and exclusive practice may be much more complex and subtle than might otherwise be assumed to be the case. Hansen (2012) argues that the issue then becomes one of understanding the nature of the boundaries within the school setting and how they are shaped and determined in order to promote inclusive practice.

Building inclusion for all collaboratively

The chapter was initially framed within a global context examining a range of factors that impact on the lives of children and young people and their education. Schools are part of a wider eco-system. If inclusion for all is to be realized, policy, at the international, national and local levels, needs to coalesce. However, it is at the level of the school community that children and young people will experience their schooling as inclusionary or exclusionary, therefore the discussion to follow focuses on that level.

The discussion will initially examine two approaches that explore the boundaries between exclusion and inclusion: the first, an exploration of marginalization (Messiou, 2012b); the second, an exploration of place and belonging (Riley, 2017). The approaches, drawing on empirical research, have been selected because they have theoretical and practical insights of value for researchers and practitioners.

Examining the boundaries between inclusion and exclusion

A rationale for change

Messiou (2012b) is primarily concerned with exploring how marginalization is experienced by children and young people. She poses the question, “How can schools engage with students’ voices in order to confront marginalization and promote inclusion?” (p. 5). Riley (2017) approaches the topic from the perspective of exploring the degree to, and ways in which, school is experienced by children and young people, and adults, as a place of belonging and the role of the school community in creating schools as places of belonging and opportunity. She defines a sense of belonging as, “... that sense of being somewhere where you feel confident that you will fit in and feel safe in your identity” (p. 4). Being tied in with an individual’s sense of identity, it therefore means different things to different people. It is not a static state, but something that is dynamic and an evolving experience – it is about “... being comfortable in yourself, who you are and where you are” (p. 28). It can be seen therefore that the aims of each author coalesce, although Riley focuses more broadly on all members of the community.

For both authors, the key issue that needs to be addressed relates to the marginalization and discrimination that children and young people face. Messiou (2012b) is concerned that the dominant deficit perspective on children and young people who are categorized as belonging to specific groups, and the labeling associated with it, lead to a failure to recognize the individuality of the child and deflect attention away from contextual factors which create the conditions under which children and young people become marginalized. Like Florian (2019) and Slee (2018a), she is concerned also by the conflation of inclusive education with categories of need in government policy. Recognizing that the actions of teachers can serve to disenfranchise children and young people, and concerned about a range of issues relating to diversity and the learning and social relationships of children and young people in schools, the author asks, “What more can be done in schools?”

Messiou (2012b) considers marginalization to be a complex, abstract concept that can be understood in a range of different ways and is contextually situated. Whether in reference to the social or academic aspects of children and young people’s lives, it can be both overt and covert (not always recognized as such). It is socially constructed through the interactions and labeling that occurs in social groups. Those who deviate from the norm are considered to be marginal to the group. However, the boundaries are not rigid or static, but fluid in nature.

She categorizes marginalization in four ways, encapsulating both the experience of marginalization and the recognition of it (or not) by the child and/or others (Messiou, 2012a, 2012b, 2019). She argues that the subjective experience of the individual is not given sufficient consideration. This means that there can be a disparity between the child’s perception of whether or not they experience their life as marginalized and the perceptions of others. Children and young people who, in the eyes of others, are marginalized may not experience their lives in this way (or may be in a state of denial). There may be other children and young people who experience their lives as marginalized but it is not recognized as such, by others. Thus, labeling cannot be regarded as synonymous with marginalization (Messiou, 2012b).

Riley (2017) draws attention to the divided and chaotic lives that many children lead in a turbulent world characterized by “global churn,” marginalized through poverty, dislocation and ethnicity, creating “insiders” and “outsiders” – “those who felt

safe and those who didn't" (p. 39). She observes a "them and us" culture that characterizes some schools where children and young people are not valued for whom they are:

... being forced as a child or young person to conform to a school ethos which denies who you are in an enforced process of "belonging" or in which you are ostracized by staff or students, or bullied, is to deny young people their identity and start an unfolding chain of exclusion: within school and beyond the school gates (Riley, 2017, p. 38).

Messiou (2012b) believes in the transformational power of inclusive education, enabling teachers to reach out to all children, irrespective of the labels assigned to them. Riley (2017) believes that schools can serve as places of safety where values can be explored and trust built. They can help children and young people to "... face the unknown, to understand the complexities of the past and present" (p. 23). They can be places of opportunity where all children and young people can flourish. In her view, how schools reach out to their communities – and view their cultures, practices and beliefs – will shape the identities of children and young people within the school community, fostering their engagement with the world. If schools are to become places of belonging and opportunity, they need to have an understanding of the lives of children beyond the school gates and to be friendly, welcoming environments for all.

Frameworks for exploring policy and practice

Both authors propose a collaborative, enquiry-led approach in taking the work forward in schools based on frameworks, deriving from empirical research, to act as a scaffold for enquiry, reflection, learning, policy and practice.

Messiou (2012b) forwards a four-step framework to be carried out with researchers working alongside participants within schools (who could be staff and/or students) to investigate marginalization, using a wide range of data-collection methods – observation, interviews, questionnaires, sociometric measures, visual images and activities, such as role-play. The framework (cc. Table 1) focuses primarily on the roles of students and teachers and the collaboration between them in addressing marginalization.

Riley (2017) proposes a three-step framework (cc. Table 1) in a highly participative process with school leaders, teacher and student researchers exploring the themes of place and belonging through a range of research methods, including visual methods and activities. She emphasizes the role of school leaders as "Place Makers" (see discussion to follow) who, through working through the framework, make sense of a complex range of realities.

While framed in different ways, there are strong commonalities between the two conceptualizations. Initially, the frameworks are concerned with coming to a deep understanding of context and providing the opportunities for voices to be heard through a range of mechanisms. Creating a culture of trust and transparency is crucial at this initial stage. The second stage is about making sense of the data in a collaborative process to identify key messages. The final step is about putting into practice what has been learned to create inclusive school communities.

Messiou (2012b) creates a strong rationale for her framework, seeing it as a means of ensuring that issues of marginalization are identified and addressed within the school community, bringing to the surface features that are important for achieving inclusion for all, reconstructing and reimagine schooling, particularly for those children and young people most disadvantaged (Messiou, 2012b).

Riley (2017) argues that, if students are to engage with the world in an enquiring manner, there is a need to build capacity in the system through investing in the professional development of teachers as change agents while simultaneously involving children and young people meaningfully in decision-making that affects their education and welfare. Through "unlocking" how children and young people feel and experience their lives in school and establishing which children are on the "inside" and "outside," the potential of children and young people can be realized.

Both Messiou (2012b) and Riley (2017) recognize the importance of student voice and agency in shaping the lives of children and young people, reflected in a growing emphasis on democracy, citizenship and children's rights. However, Messiou (2012b) observes that approaches toward promoting student voice can be mechanistic and tokenistic in nature rather than authentic. The

Table 1 Derived from Fig. 1.2 (Messiou, 2012b) and Box 9.2 (Riley, 2017).

Framework for promoting inclusion Messiou (2012b)		Framework for Belonging (Riley, 2017)	
Step 1	Opening doors: Enabling voices to emerge	Step 1	Making sense of the context
Step 2	Looking closely: Bringing concerns to the surface	Step 2	Looking through the prism of place and belonging to understand the importance of place and belonging
Step 3	Making sense of the evidence: Sharing data with learners		
Step 4	Dealing with marginalization: Encouraging inclusive thinking and practice	Step 3	Being and becoming a place maker, building trust, developing the knowledge and capacities of staff; and harnessing the creative potential of young people, to create schools which are places of belonging and inclusion (p. 138).

framework, in her view, provides a mechanism for the voices of those children and young people who do not belong to readily identified groups to have their voices heard and for perspectives which might not normally be aired to be legitimized. It has the potential to truly value what children and young people have to say, empowering them and affirming them as valued members of the school community (p. 27).

Implications for school leadership

Messiou (2012b) discusses the role of school leaders in being supportive of and facilitating the process of gaining commitment from staff toward the authentic engagement with students' voices. Riley (2017) describes the role of school leaders as "Place Makers" who, through their mediating influence, shape the norms, beliefs and expectations of the school community, where all members of the community can be valued for whom they are. They create spaces where children and young people can freely express their views while also balancing the external demands of the school and working to create a sense of safety, belonging and agency (p. 136).

Reflections

Key themes to have emerged in the discussion of the two frameworks are the importance of participative, collaborative enquiry-led approaches in working with schools; student voice and agency; teacher professionalism, voice and agency; a sense of belonging and connectedness to school; the primacy of relationships and trust; building bridges with the local community, understanding at a deep level how children and young people experience their lives in and out of school; and the role of school leadership in creating the conditions for inclusive school communities where children and young people can flourish. The discussion to follow will examine some of these themes in greater depth.

The importance of a sense of belonging to school

Having a sense of belonging to school has been identified with a wide range of positive indicators and outcomes related not only to academic achievement (enhancing children's sense of self-efficacy, enjoyment of school and intrinsic motivation toward learning) but positive school transitions, social relationships and mental health and wellbeing, ameliorating the risk-factors in their lives (Berryman and Eley, 2019; Inchley et al., 2020; Mays et al., 2018; Mowat, 2019b; 2019c; Prince and Hadwin, 2013; Riley, 2017; Riley and Rustique-Forrester, 2002; Slee, 2019; Vetoniemi and Kärnä, 2019).

For children with SEN, a sense of belonging is a fundamental psychological need that may be integral to their motivational development and engagement in learning. If lacking, it may lead to a range of negative outcomes, such as behavioral problems and poor emotional and mental health (Prince and Hadwin, 2013). In exploring the experience of children with SEN and their mothers (Connor and Berman, 2019; Tsovoka and Tarr, 2012), it becomes clearly evident that the children's inclusion in social activities and events, whether in or out of school, and the degree to which schools and teachers facilitate participation in learning are key factors in the sense of belonging and connectedness felt by the children. A sense of being accepted and appreciated for whom they are not only enables children and young people to feel part of the school community but enhances the understanding of that community (Connor and Berman, 2019).

For Slee (2019) belonging is key to inclusion, at the heart of which lies owning (taking responsibility for) and valuing all children. A concept that closely aligns with this stance is that of *unconditional positive regard*, associated with Carl Rogers, the father of *Person-Centered Therapy*. A central tenet of *unconditional positive regard* is the need to value all people unconditionally, based on acceptance and respect, characterized by warmth and sympathy (Bozarth, 2007). What this means is that acceptance into the school community should not be dependent on certain characteristics of the child, achievement or conformity to accepted norms of behavior. Where it is seen that some children are only accepted into the school community conditionally it gives the message to all children that they also are only accepted conditionally (Khon, 2005). It has been established that teachers respond more warmly to children whose values are in line with those of the school (Hedegaard-Soerensen and Grumloese, 2020), thus valuing all children for whom they are may present as a challenge to some schools and some teachers where the values of the home and school differ.

Warm relationships between children and between children and teachers and participation in school activities are essential elements of a sense of belonging and connectedness to school (Berryman and Eley, 2019). However, the authors caution that a relentless focus on excellence and equity (excellence for all) without giving due consideration to a sense of belonging and cultural identity may lead to restricted understandings, policy and practice, culminating in the marginalization of some children.

School systems that focus on performativity at the expense of the holistic growth and development of the child, often coupled with zero-tolerance approaches toward school discipline, militate against a sense of belonging and connectedness to school. Unlikely as it might seem, even approaches which are advocated in the name of promoting positive behavior, such as the use of behavior charts; gold stars and stickers; and rewards (Jenny Mosley's "Golden Time" by which children have to earn access to desired activities through adherence to the "Golden Rules," being one such example) serve to disenfranchise and shame those children who rarely or never gain the desired reward (Jung and Smith, 2018; Khon, 1999; McLean, 2003). These children are being given a clear message that their acceptance into the school community is conditional. In the process, it gives a strong message to all children and young people that it is acceptable to exclude other children from their activities.

Building community and empowering the school community

Both [Messiou \(2012b\)](#) and [Riley \(2017\)](#) build compulsive cases for involving the school community not as objects or subjects of research but as fully engaged participants within the research process. They built on the earlier work of pioneers of student voice and participation such as Jean Ruddick and Roger Hart (“Ladder of Participation”) and the innovative work of Mary Kellett in re-imagining research with children. Engaging in participative enquiry is a very powerful means of building community and a vision for improvement within a school but it is not the only means.

[Khon \(2001\)](#) argues that “a community rests on the knowledge of, and connections among, the individuals who are part of it” (p. 113). He also argues that community, in itself, is not sufficient: when community and autonomy come together, they create democracy. [Sergiovanni \(1994\)](#) proposes that relationships within communities are characterized by shared understandings and obligations toward others, an endeavor based on schools defining their own life and creating their own practices of schooling. Thus, building community is based on the principles of democracy; of respecting human rights; of giving people a voice; on agency and autonomy; mutual understandings and obligations toward others; connectedness; and creating a vision for the school which reaches out across the school community and beyond.

Parental engagement

Parental engagement is a key aspect to building community in schools, furthering the learning of children and young people and creating equitable and inclusive school systems. Yet, there are significant social, cultural and economic barriers to parental engagement, making it difficult for schools to reach out to parents ([Goodall, 2018](#); [Goodall and Montgomery, 2014](#); [Harris and Goodall, 2008](#)). This is particularly the case for families who may experience their lives as marginalized.

The narratives of parents of children who are disabled, as represented in the accounts of [Tsovoka and Tarr \(2012\)](#), are sometimes harrowing and it is evident that they are disempowered, often feeling on the margins of decision making and frustrated on behalf of their children. The impact of the pandemic in the UK (as previously discussed) severed many of the support systems for families of disabled children and children and young people who were shielding lost the opportunity to attend school and mix with their peers, even when schooling resumed.

A current small-scale empirical study, which I am leading with colleagues at the University of Strathclyde, focuses on how current and former prospective students on the Into Headship programme (a national programme for prospective headteachers (Principals) in Scotland) supported their school communities during the initial stages of the pandemic when schools were closed. A strong emerging theme is that of a changing conceptualization of their identity and role: many assumed responsibility not only for the wellbeing of students, but for their families also:

It has been so hard not “seeing” our children and this highlighted the importance and value of the relationships we build with families ... we felt an overwhelming sense of responsibility for our whole school community and at times struggled to accept that there were limitations in what we could actually do. We had to support staff and families without overwhelming them and at times this was really difficult to do as everyone was reacting and coping in different ways. Due to this a uniform approach for all wouldn’t work so we had to make professional judgements with the knowledge and information we had on individuals before and during lockdown. (Primary School Depute Headteacher, Scotland).

The above epitomizes for me the essence of an inclusive school community. The care and compassion for children and young people and families is self-evident and, as highlighted by [Riley \(2017\)](#), it rests on an in-depth knowledge and understanding of individual families and their circumstances – it’s not a “one-size-fits-all” approach.

Transforming schools to build inclusion for all

This chapter has highlighted the global drive and vision for inclusion for all, emanating from the late 20th Century, and the trials, tribulations and tensions in its realization. Having passed the 25th anniversary of the signing of the Salamanca Statement, it would be easy to focus on what has not been achieved but, in my view, it is remarkable what has been achieved. The pandemic has undoubtedly widened social, educational and health inequalities in society but, as illustrated in the cameo above (which was representative of many of the responses), it has also brought out what is best in society, strengthening a sense of community and compassion. The challenge will be to build on this in the future as we emerge toward what has been described as the “new normal.” It is an opportunity to re-imagine schools.

There are many other aspects of building inclusion for all which could have been included within this discussion, for example, the importance of inter-professional working and the role of mental health services in supporting children and families. Mel Ainscow and colleagues have examined inclusion and inclusive practice from a systems perspective ([Ainscow, 2012, 2015](#); [Ainscow et al., 2012](#)), exploring issues around equity and school improvement. However, an area, which, in my view, requires much greater attention, is the role of school leadership in creating inclusive school communities and the professional development of headteachers (pre-and post-appointment) toward this end. Riley is one of the few scholars in the field who brings this perspective to her work.

It is not enough to be committed to inclusive practice, important as this is. Theories of change management indicate that a great deal of groundwork needs to be done before the transformation of a school becomes possible. According to [Fullan \(2016\)](#), “... an effective change process shapes and reshapes good ideas while it builds capacity and ownership among members in the group”

(p. 46). Key elements of capacity building are having a thorough knowledge and understanding of the context and culture of the school and its community; building capacity in the school through democratic, ethical and shared forms of leadership where members of the school community are able to exercise autonomy and agency; building a collaborative vision for the school, built on values which guide the school community; creating the spaces and places for participation where individual voices can be heard and ensuring that the mechanisms are in place for them to be acted upon; aligning resources to where they are needed; and building bridges and partnerships between the school and its community, drawing on the strengths of the community (Coates, 2017; Fullan, 2016; Fuller, 2012; Gross and Shapiro, 2016; Hargreaves and Fullan, 2012; Liasidou and Antoniou, 2015; Riley, 2017; Theoharis and Scanlan, 2015). Fundamental to all of the above are the values of integrity, trust, respect for self and others, transparency, care and compassion, social justice and a sense that we all have a responsibility toward each other.

While the latter part of this discussion has focused on what schools can do to challenge marginalization and build inclusive communities, schools alone cannot achieve inclusion for all. It will require a concerted, focused and collaborative global effort where educational, social and fiscal policy can coalesce to create a vision whereby inclusion for all can become a reality rather than an aspiration.

Please note that this chapter was prepared in synergy with a research monograph for Routledge which focusses on the creation of equitable, inclusive, compassionate, and empowering school communities which is due to be published in 2023. Some of the arguments in the research monograph have been condensed within this chapter and a small amount of material reproduced.

Acknowledgment

I would like to thank Professor Roger Slee, Diamond Jubilee Chair in Disability and Inclusion, University of Leeds, for his support and encouragement of my work.

Introduction

Inclusive education is a pedagogic and didactic practice that aims to increase students' possibilities of participation, learning and subjective experiences of belonging and contributing to school communities. Inclusive education is not a neutral educational practice with an unambiguous what-works-formula, which thus can be analyzed and understood in a *one-size-fits-all* manner. On the contrary, inclusive education is framed by purposes, intentions, culture, actions of students and teachers, specific locations, artifacts, and policy opportunities and constraints. Considering this, it seems reasonable to understand and discuss inclusive education through socio-cultural and historical lenses which entail a sensibility to the notion of *terroir* which in this context denotes matter in a certain place. From the outset, inclusive education, like any other educational phenomena, is shaped by societal, cultural, geographic, and historical developments. Accordingly, it cannot be analyzed nor understood if detached from the contextual practices in which it occurs. In light of this, the notion of inclusive education manifests itself in many variations and is thus shaped by specific socio-cultural and historical developments and pathways in specific countries globally.

This, however, is far from a new understanding and contributes to the difficulties in defining inclusive education. In the literature, this is often articulated as inclusive education being nearly impossible to define and operationalize (Larsen et al., 2019; Ainscow et al., 2006; Ainscow and Sandill, 2010; Mitchell, 2005). The trouble we encounter, when attempting to grasp what inclusive education is and what it really looks like in pedagogical and didactic practice, is rooted in the fact that it appears differently, with variations in potential and difficulty, around the world. Furthermore, the difficulties with grasping and articulating a clear definition of inclusive education is also rooted in a, presumably banal but nonetheless essential, question: what is inclusive education for? This teleological question serves the purpose of attempting to understand whether inclusive education is a pedagogical phenomenon on its own premises or merely an instrument of societal change. In other words, does inclusive education only have socio-political purposes or also ethical, didactical, and pedagogical purposes? A central rationale for posing this question is the fact that we in school systems around the world are witnessing an alignment between significant educational agendas. This alignment, or perhaps even collision, between education agendas can lead to substantial educational paradoxes, contra productive effects, and dichotomies in the understanding of inclusive education. In the case of the inclusive education agenda, it seems plausible to argue that there is an alignment with more neoliberal agendas of standardization, accountability, marketization, and testing in the Nordic countries (Denmark, Sweden, Norway, Finland, Iceland, and the autonomous territories of Greenland and the Faroe Islands) as well as other countries around the world (Engsig and Johnstone, 2015). Korsgaard and Mortensen (2017) argue that this alignment, between the agenda of inclusive education and a neoliberal agenda, in fact may undermine inclusive education. Following this, Korsgaard and Mortensen (2017) emphasize that we must begin to ask educational questions of inclusion, instead of asking inclusive questions of education. From this starting point, and from the acknowledgment of the necessity of a socio-cultural and historical sensitivity in understanding inclusive education as an educational phenomenon, this chapter will discuss inclusive education from a Nordic perspective and argue that different sociopolitical developments have transformed the notion of inclusive education in Nordic countries.

A Nordic model of education and the development of inclusive education

Education is often viewed as a cornerstone in any society and perhaps particularly in the modern welfare state, and it seems reasonable to assume that a central common characteristic of the Nordic countries is the existence of a comprehensive welfare state. Ydesen and Andersen (2020) argue that the Nordic welfare states have a long history of pursuing increased comprehensive schooling with

a strong focus on quality education for all. Inclusion has been an inescapable and essential priority in education policy in the Nordic countries for decades. Following this, the premise of this chapter is based on the assumption that there are common underpinnings in the Nordic education systems for it to be meaningful to discuss Nordic representations of inclusive education. Thus, it seems necessary to commence with posing the question: is it meaningful to talk about a Nordic model of education?

Larsen et al. (2019) argue that the policy of inclusion, with its focus on social justice, equity, equality, access, and democracy, is closely aligned with the notion of the welfare state. The Nordic countries are often referred to when we attempt to describe the ideal version of the modern welfare state as a way of organizing universal rights for the individual citizen (Hamre, 2018). Arnesen and Lundahl (2006, p. 287) underline that the Nordic welfare states are characterized by:

... a relative strength and autonomy of political solutions and universalistic policies which not only target the neediest, but include the whole population. Collective political action is regarded as crucial to minimise differentiation and to prevent social exclusion.

The social-democratic welfare regime, which since the post-war period has been under continuous development in the Nordic countries, is characterized by substantial economic redistribution, high taxation, universal policies assuring comprehensive health care for all, pensions, extensive childcare, and free education, as well as higher education. Hence, it is possible to identify a range of common traits in the Nordic countries which denotes shared historical and political pathways in the continuous development of the modern welfare state. An example of such shared pathways, in the development of education in Nordic countries, is the idea of comprehensive education, which is firmly rooted in the ideology of the welfare state, and to a certain extent stands on social democratic foundations (Arnesen and Lundahl, 2006). The social motive of education is shared in Nordic education systems and reforms, and Arnesen and Lundahl (2006) address that particular Norwegian and Swedish education reforms stress the social motives of education. A substantial reform of the Danish school system in 2014 also entailed an extensive focus on the significance of students' social background in relation to achievement. Divisions within Nordic education systems are few and a large majority of students in Nordic countries attend public schools. Arnesen and Lundahl (2006) show data from OECD illustrating, that an overwhelming percentage of students in the Nordic countries go to public schools, and that the percentage of students in private school are well below OECD average. Another shared pathway, in the development of a Nordic education model, is the spending on public schooling. Data from the latest Education at a glance show, that Nordic countries are well above OECD average in total expenditure on educational institutions as a percentage of GDP (OECD, 2021). In other words, the comprehensive school systems in Nordic countries are a shared political priority and hence it is prioritized in relation to public spending on education systems. Another common trait, or a shared pathway, in Nordic education systems is an emphasis on pedagogical and didactic differentiation instead of tracking and use of segregated special education. The recent reform of the Danish school system underlined the need for more inclusive schooling and more differentiation and the Finnish curricula stresses that education should be based on equality and tolerance and develop communality. The Norwegian curriculum also entails a strong emphasis on a school which should include different groups of students and reduce social inequality (Arnesen et al., 2007). Although it must be acknowledged that the Nordic countries are independent countries with independent histories, cultures and demographics, Sweden, Norway, Finland, Denmark and Iceland share, as mentioned above, some common traits that are useful to consider when analyzing the characteristics of the modern Nordic welfare state. A strong interdependency between economic growth, and policies regarding capitalist economic development, and welfare on both an individual and collective level is shared by the Nordic countries (Arnesen and Lundahl, 2006). Hence, as Arnesen and Lundahl (2006) observe, the development of the modern welfare state in the Nordic countries entails a strong emphasis on social equality on the one hand and economic development on the other hand, which have resulted in interventionist welfare states.

Following this brief history of the development of the Nordic modern welfare states stands the question of the existence of a Nordic model of education, and perhaps even a Nordic model of inclusive education. In the development of the modern welfare state, in the Nordic countries, schooling was, and still is, to a large extent viewed as a quintessential welfare institution, which entails the capabilities of reducing social inequalities and enhancing social mobility and thus reducing barriers for access, participation, and learning. Lundahl (2016) indicates that the notion of a Nordic model of education historically has been utilized to point to the similarities in educational reforms, during the second half of the 20th century, that have shaped the school systems we see in the Nordic countries today. These educational reforms are aimed at: "social justice, equality and cohesion not least by providing schooling of high and equal quality, regardless of children's and young people's resources, origin and location" (Lundahl, 2016, p. 3). In other words, several education reforms in Nordic countries aimed at reducing inequalities and increasing social mobility and equity, have shaped common Nordic pathways that make it plausible to argue for the outlines of a Nordic model of education. Thus, it seems reasonable to assert that we do indeed see substantial similarities in the developments of schooling and educational systems in the Nordic context (Lundahl, 2016; Antikainen, 2006; Telhaug et al., 2004). However, as Antikainen (2006) stresses, it might be more sensible and adequate to talk about common patterns or, as this author suggests pathways, in the development of education in the Nordic countries and not as a fixed model of education. The question, that follows concerns the possibility of identifying similarities in the development of inclusive education in the Nordic countries.

Representations of inclusive education in the Nordic countries

Having established that it is justified, to a certain degree, to talk about common pathways in the development of education in the Nordic countries, I will now discuss similarities in the developmental pathways of inclusive education in the Nordic countries. The following will be based on the premise that the notion of inclusive education is rooted in some common traits and ideas but that there is no universal model of inclusion that fits all countries. Haug (2017) emphasizes that each country must develop its own pathway to inclusive education.

Inclusive education is linked to ideas and principles of democracy, equity, equal rights, access and participation. Haug (2017) argues that the practical state of inclusive education varies globally, nationally, and even between and within schools. Furthermore, Haug (2017) observes that in all countries there is a substantial gap between formulations and realizations of inclusive education. This also seems to be the case in the Nordic countries and can to some extent be attributed to the fact that understandings of inclusion, and thus contours of practice, range from mere placement of students in general neighborhood schools to a more fundamental transformation of the ways in which schooling is practiced based on values, ideas and educational practices (Bacon, 2020). With this in mind, the history of the development of inclusive education in Nordic countries is too complex to be discussed exhaustively in this chapter, but it seems reasonable to argue that inclusion has been a key educational idea, phenomena and ideal since the 1990s and has furthermore been adapted to educational policy-making, social policies and development of welfare states (Arensen and Lundahl, 2006).

Providing access to education for all has been a key driver in the development of inclusive education in the Nordic countries. This must be understood as a significant element in the development of the modern welfare state where equal opportunities for participation in society is absolutely central. Education policies in the Nordic countries have throughout the years developed a more stringent focus on providing opportunities for all regardless of factors such as social class, gender, ethnicity and academic abilities. An example is the substantial reform of the Danish school system in 2014. One of the reform's three national aims was that schools had to reduce the significance of students' social background in relation to their academic results (Engsig, 2020). The Danish example, which is illustrative of the push for equal opportunities in educational policies in Nordic countries, emphasizes that access not only refers to free comprehensive education in the Nordic welfare states, but also to guaranteeing opportunities for all to profit from comprehensive education. One could argue that the Nordic countries' development of a comprehensive school system, providing compulsory education for all, starting in the 1960s and 1970s, provided the building blocks for today's Nordic representations of inclusive education. There is a strong tradition of differentiation in the Nordic countries and streaming is less practiced than in many other countries:

Streaming is still largely absent from compulsory education in the Nordic countries, and special education support has moved from separate schools and classes to the "inclusive school", i.e., it is to a great extent now integrated with other teaching in the classroom

Lundahl (2016, p. 8).

A school system with a minimum of streaming or tracking students is common for the Nordic countries and is a central component to Nordic representations of inclusive education. Lie et al. (2003) argue that the Nordic strategy for building school systems, which display a high degree of inclusiveness, equity, and quality entails comprehensive school systems that do not practice streaming or tracking. It seems fair to accentuate that there is a fairly equal provision of education at different levels in the Nordic countries which is supported by data pointing to the fact that the Nordic countries have a higher degree of socio-economic variation in compulsory schools compared to other OECD countries (Lundahl, 2016). Data from OECD indicate that the Nordic countries is above OECD average regarding social inclusion, which in this context refers to the socio-economic variation within schools (OECD, 2012). Furthermore, Arnesen and Lundahl (2006) show that students from the Nordic countries display strong democratic beliefs and values and report a stronger sense of belonging compared to the OECD average. The results from PISA 2018 show, that in Denmark, Sweden, Norway, Finland and Iceland students report a relative high degree of sense of belonging at school. The Nordic countries are all on the OECD average or slightly above when it comes to students who agree or strongly agree with statements as: I make friends easily at school; I feel I belong at school and other students seem to like me (OECD, 2019). There are indications to support that there are some common pathways to a more inclusive school system in the Nordic countries which are coherent with the history and development of the Nordic modern welfare state and ideals regarding schooling. Lundahl (2016) concludes that the Nordic countries do indeed display certain common inclusive qualities and that it is justifiable to speak of a Nordic education model which emphasizes equality and social justice. The same way that it is justifiable to argue for common Nordic pathways in the development of the modern welfare state and (inclusive) education it also seems plausible to argue that we currently witness a shift from the welfare state to the competition state in the Nordic countries and, furthermore that this has implications for inclusive education. The Nordic countries share similarities in developmental pathways regarding the modern welfare state as well as school system. However, it is imperative to underline that the Nordic countries are individual states with strong individual history, cultures, and demographics, but, as discussed in the above, it is justifiable that the Nordic countries do indeed share central pathways on the way to both the modern welfare state as well as the welfare state's inclusive schooling.

From welfare states to competition states

The Nordic countries share other central similarities which have substantial implications for the modern welfare state, education in general, and inclusive education. Lundahl (2016) shows that in the 1980s and 1990s decentralization reforms were initiated in the Nordic countries providing municipalities and schools more autonomy to (re)allocate resources and to implement national policy aims. Lundahl (2016) proposes that extensive decentralization in Nordic countries was a precursor for a more neoliberal development in school systems. Interestingly, Nordic researchers analyzed and discussed changes in educational policies, in a special issue of *Journal of Educational Policy*, and concluded that the neoliberal changes and policy push was an echo of developments in other OECD countries (Lundahl, 2016).

In order to understand the transformations of inclusive education in Nordic countries, we must first understand the broader social changes in Nordic countries. Kristensen (2012) argues that the Danish welfare system has changed radically from a welfare state to a competition state. This applies more broadly across Nordic countries. Kristensen's (2012) argument is that mobilization, self-support, and inclusion are more adequate characteristics of the Nordic welfare state than support, protection and compensation. In line with this, there is evidence to suggest that neoliberal educational agendas are driving a shift in educational values moving from ideas of the collective to the individual and from the notion of "bildung", or the cultivating role of education, to a more rigorous focus on output or achievement. Arnesen and Lundahl (2006) point to a shift in the educational values which education in the Nordic countries have been rooted in for decades. Education policies in the Nordic countries have a long tradition of emphasizing democratic core values and that one of the primary purposes of education is educating for democratic participation. This is, to a large extent, still at the center of educational policy and curricula in the Nordic countries, but we have witnessed another powerful agenda claiming attention:

However, from the 1980s and onward, the rationale for educational attainment has changed from emphasis on collective values and social community to a focus on individual rights, academic progress and choice. Hence, contemporary political and educational discourses reflect dilemmas and contradictions between utility and culture, economy and welfare, the public and personal, community and individual

Arnesen and Lundahl (2006, p. 295).

This movement in educational agendas and values, in the Nordic countries stems from a neoliberal marketization of education which also entails an individualization in relation to the notion of purpose. Korsgaard (2016) states that we are currently witnessing a re-examination of inclusive education across the globe due to a "collapsed construction of what school is at policy, practical and theoretical levels and in part by an increased political focus on the use of the terms inclusion and inclusive education" (p. 935). This poses the question, and a teleological quest; what is inclusive education for and what type of schooling are we including students in? Korsgaard and Mortensen (2017) argue that we must "... begin to ask educational questions of inclusion, as opposed to inclusive questions of education" (p. 1245).

The intersection of educational agendas

The shift from the modern welfare state to the competition state is becoming obvious in the Nordic school systems through a central phenomenon: the intersection or alignment of educational agendas. As described above, Nordic countries went through a marketization, individualizing and decentralization and educational policies have, to an increasing degree, been rooted in neoliberal policies with a focus on standardization, accountability, high-stakes testing, and a focus on individual achievement and competition (e.g., Bacon, 2020; Engsig, 2020; Engsig and Johnstone, 2015). One could argue that the Nordic countries have undergone an instrumentalization of education which have contested the value-based and community-orientated purposes of schooling. The agenda of inclusive education is supported by UNESCO and The Salamanca Statement (UNESCO, 1994), The Convention on the Rights of Persons with Disabilities (United Nations, 2006), as well as the Sustainable Development Goals (United Nations, 2015). International declarations that are all increasingly pushing for more inclusive school systems around the globe. On the other hand, the neoliberal agenda, with a push for marketization, individualization, standardization, high-stakes testing, accountability, and international and national competition, is linked to the OECD and in particular manifested through PISA, TIMMS, PIRLS and other international assessments. There is substantial evidence that we are currently witnessing an alignment between the agenda of inclusion and a more neoliberal agenda. Bacon (2020) argues that neoliberalism and ideas of inclusion conflict ideologically, and that neoliberalism threatens a communal ideology based on equality, reciprocity and human dignity:

... market reforms allow families to opt to avoid engaging in learning alongside those who are different, which is the rationalized as the "choice" of families and students ... exclusivity rather than inclusivity is the primary goal of market-driven policies (p. 53).

Korsgaard and Mortensen (2017) assert that this clear conflict between the agenda of inclusion and a neoliberal educational agenda undermines the very purposes of schooling and inclusion. Arnesen et al. (2007) raise the concern that a market-driven

culture and school system, where factors such as competition and efficiency are main drivers, may push ideals such as inclusivity, equity and collaboration in the background. In a comparative analysis between the discourses of inclusion in a Danish and American context, [Engsig and Johnstone \(2015\)](#) propose a framework of inclusions emphasizing the notion that policies of inclusion can be rooted in different foundations on a continuum of Salamanca-inspired inclusion with a focus on rights and ethics on the one side and a more neoliberal and accountability-inspired inclusion with a focus on excellence, accountability and output on the other side.

A Danish example: inclusion and a call for excellence

In a Danish context we have a series of events in education policy-making that function as a strong example of the intersection between educational agendas. This is a view into events in one Nordic country as an exemplification of the collision between educational agendas and in doing so I do not claim that all the Nordic countries have experienced same phenomena. Nonetheless, the Danish example does not stand alone in the Nordic countries in illustrating the movements in the underpinnings of inclusive education in the North.

In 2012 the so-called Inclusion Law, which was a modification of the national Education Act, was passed in the Danish parliament. Following this legislative modification, students who needed more than 9 h of support per week fell under the act of special education and hence received the funding and support following this. The act redefined the very notion of special educational needs and special education and thus dramatically decreased the number of students receiving special educational support. This was a push for inclusive education and a call for municipalities and schools to dramatically reform their practice regarding students in special educational needs. In 2014 the Danish school system underwent yet another comprehensive reform. The motivation for the reform was anxiety regarding student achievement and Denmark's performance in international comparisons. The reform marked a clear push for excellence, standardization and accountability. The background text, for reforming the school system, clearly stated that all students, regardless of their background, should fulfill their potential and be as proficient as possible. The reform entailed three national goals:

1. Danish schools must challenge all students so they can be as proficient as possible;
2. Schools must reduce the significance of students' social background in relation to their academic results;
3. Confidence in the school system and students' well-being must be improved through increased respect for professional practice ([Engsig, 2020](#)).

The education policy, on which the school system and pedagogic and didactic practice was rooted, emphasizes both inclusivity and a neoliberal focus on output, individualization, excellence, and accountability. In other words, Danish municipalities, school administrators, and teachers must ensure educational access and inclusive education with a constant focus on the improvement of learning achievement ([Engsig, 2020](#); [Hedegaard-Soerensen and Grumloese, 2020](#)). In the Danish example there is a clear alignment between prominent international educational agendas—a push for a more inclusive school system and a neoliberal push for excellence, standardization, testing and accountability.

In a Danish study [Hedegaard-Soerensen and Grumloese \(2020\)](#) conclude that teachers are, to a large extent, loyal to the discourses regarding excellence, learning achievement and individualism and thus the agenda of inclusion seems to fade into the background. Furthermore, they underline the significant finding that neoliberal education policies present a barrier for teachers when it comes to teaching for diversity. One could argue that these findings support the claim that the intersection between the agenda of inclusion and a more neoliberal agenda pushes the practices of inclusion which may lead to reductionist approaches to inclusion. [Bacon \(2020\)](#) argues that a reductionist approach, as opposed to a radical inclusive approach, reduces inclusion to: "a technical solution to problems of resourcing, managing, groupings and designing instruction" (p. 54).

Concluding remarks: continuum of inclusions

The beginning of this chapter argued that inclusive education, and a discussion of Nordic representations of inclusion, must be rooted in a contextual perspective and from socio-cultural and historical lenses. There are substantial common traits in both the development of the modern welfare state, and the movement toward the competition state, in the Nordic countries as well as in regard to inclusive education. Inclusion is understood and practiced differently around the globe and despite of the common pathways and traits in Nordic countries this is also the case in this context. [Kiuppis \(2013\)](#) is promoting the term 'inclusions' in order to capture this conceptual, theoretical and empirical diversity. In order to fully grasp the notion of inclusions one could understand Nordic representations of inclusion on a continuum. This can be done in several manners, but [Engsig and Johnstone \(2015\)](#) have analyzed the paradoxical policies of inclusion through the theoretical lens of [Dyson \(1999\)](#) and his proposed framework on discourses in inclusive education. In this analysis [Engsig and Johnstone \(2015\)](#) showed that the policies of inclusion, in the case of Denmark, could be positioned on a continuum of inclusion from Salamanca-inspired inclusion, with a focus on educational access, rights and ethics, to a more neoliberal and accountability-inspired inclusion with a focus on excellence, output and accountability. A similar analysis could be done regarding all the Nordic countries and this would most likely show an even more complex picture of the various inclusions, and intersectionality of educational agendas, that are at play in a Nordic context.

Introduction

With inclusive programs gaining ground and developing global momentum, many educational institutions are keen to secure a set of measurement indicators to inform program development for students with disabilities. Schools around the globe continue to experience challenges with not just crafting a socially-just inclusionary learning program, but with implementing and evaluating their programs against an established set of criteria. Little research has been undertaken that has international relevance in terms of what indicators may suit different countries. There is also some criticism of the past work as not all indicators are relevant and sensitive to different international contexts. In this paper we identify several indicators that could be relevant to most international contexts. This paper builds on the work of [Loreman et al. \(2014\)](#) which examined international literature to identify inclusive education indicators. Inclusive education has continued to receive global attention within this period, and has emerged as an evolving, organic field with research taking place in both established and developing education systems. The most prominent publication that illuminates the position of socially-just inclusion within school and tertiary education, is the Global Education Monitoring Report ([United Nations Educational Scientific and Cultural Organization, 2020](#)). Triggered and informed by this dynamic exchange of ideas, this piece adds to the existing set of indicators. While preserving the initial themes as underpinning indicators to measure inclusive education, it draws on more recent data, providing an updated framework to gauge the effectiveness of inclusionary programs. The review will be directed by the overarching question of which themes are still relevant for inclusive education in contemporary times. Additionally, emergent inclusive education programs, remain in need of appropriate indicators to obtain an understanding of how to create effective inclusive programs. Media reports highlight this need in this paper, the definition of inclusive education will continue to be framed by UNESCO guidelines:

Education is not simply about making schools available for those who are already able to access them. It is about being proactive in identifying the barriers and obstacles learners encounter in attempting to access opportunities for quality education, as well as in removing those barriers and obstacles that lead to exclusion.

[UNESCO \(2012, para. 1\).](#)

Frameworks for examining inclusive education: the global approach

For the purpose of this review, a universal framework was adopted at the outset, seeking out indicators for inclusion from across the globe. In this regard, a more sensitive view was implemented toward countries classified as developing or as low-income contexts. Inclusionary programs in the developing world are often in fledgling status when viewed through the lens of western accomplishments. This juxtaposition of high-economic and low-economic status, often neglects fundamental cultural norms. There are fewer studies contextualized in the developing world, and those that do, utilize a Western lens. Most cultural orientations in the developing world embrace the view that those who are limited, or who require additional assistance, are to be supported. A commonly held South African belief, coined by Archbishop Desmond Tutu, notes that: "A person is only a person on account of other persons." This acknowledgment of human codependency is an essential trait of more collectivist cultures, and often embedded within the developing world, or countries of the Global South. Sharma (2020a) in exploring the opportunities, strengths and challenges associated with inclusive education in the Pacific region, reflects on the local tradition of "Talanoa," which literally means "to talk." This collectivist and collaborative mindset led to the care, nurturing and facilitation of opportunities for all members of a group, particularly those who cannot speak for themselves (Sharma, 2020b). The First People of Australia, do not acknowledge "disability," and seem to perceive the term as contradictory to their traditional beliefs (Velarde, 2015). In an investigation of the Anangu people in Western Australia, one study notes that Indigenous people do not distinguish disability or impairment, they celebrate the unique construction of each human being, accepting human diversity (Ariotti, 1999). Another study notes that the Maoris of New Zealand (Aotearoa), conceive differences as natural, with disability forming a unique aspect of an individual's identity (Fitzgerald, 1997).

In this regard, indicators were explored within the context of the "policy borrowing" approach, which draws on established practice from countries around the globe. A key element with policy borrowing is a consideration of transferability, especially since the experiences of one context may not necessarily translate effectively in another (Phillips and Ochs, 2003; Steiner-Khamisi and Waldow, 2012). Often policy borrowing does not translate well, given the particular dynamics of individual nations, so we also drew on the work that embraced policy learning, which draws from a nation's own history and develops reform based on contextual and cultural practices (Raffe and Spours, 2007; Sharma, 2020a). Merging the two methods, allowed the authors to draw on multi-national policies, while being mindful of the unique and individual contingencies.

Another framework adopted is through the lived experiences of the authors. Both authors, though now naturalized in Australia, hail from developing countries, and therefore wear multiple lenses in examining the indicators associated with inclusive education. This allows them to be outsiders looking in, and insiders looking out, a technique adopted by immigrants and expatriates through an altered lens (Subban and Clemans, 2017). As a consequence, indicators of inclusion are viewed from both a culturally-oriented perspective and from the view of academics within the inclusive education context. These perspectives allowed for a more informed, critical eye over research studies, literature and gray material available during the stipulated period of time. In identifying the indicators, heed was paid to the United Nations Convention on the Rights of People with Disabilities (2006), the European Social Charter (1961), and the Salamanca Statement (1994), all of which remain fundamental to any dialog on inclusive practice. However, the indicators gathered as markers of inclusive education for this manuscript shifted beyond the legal rights of students with disabilities, translating this right into practical components which could potentially be used by school leaders and practitioners around the globe. In drawing together the indicators, the authors were mindful that the partitions between special schools and regular schools are being progressively dismantled, with many special schools becoming consultation and resource hubs (Komer, 2018). The authors were able to amalgamate ideas to build, improve and enhance inclusionary practices in both developing and developed countries, acknowledging that any intervention or strategy should be contextualized and responsive. It is perhaps unwise to perceive a single practice or implementation as excellent, as its applicability to a national context is relative (Raffe and Spours, 2007).

In this paper, we distinguish inclusion as an ongoing process involving the identification of barriers to learning and participation of all learners, including those with a range of diverse profiles. Inclusion is also about identifying context-sensitive and culturally-responsive solutions to the barriers that many learners face. Additionally, implementing inclusive education is not possible in schools that fail to support educators with their inclusive education efforts. We acknowledge that inclusionary programs present educators with a challenge, and it requires extensive efforts and careful planning of many stakeholders. In this paper, we identify a number of indicators that schools and systems can use to prioritize their actions.

Facilitating the purposive search

As researchers and teacher educators in the field of inclusive education, both authors were keen to include eligible, contemporary studies, which generated indicators for inclusive education. In selecting these studies, we prioritized studies in the developing world, ensuring that the findings of these studies were relevant, and produced rich data that would inform indicators for inclusive education with global appeal. Consequently, data was extracted from individual studies, relating to location, objectives, and results which were pertinent to this review. In the article search, the date range was set from 2014 to 2020, in order to avoid an overlap with research utilized by Loreman et al. (2014). The search was restricted to studies involving inclusive education that were written in English. Given the broad yield of material in this field, the following were considered when identifying substantiation for the indicators in this piece:

- The article should have primarily covered information about inclusive education.
- It should report on measurement, assessment, evaluation or indicators of progress in inclusive education.
- It must have been published after 2014.

Some articles that were outside this date range were included in the final analysis, but these were often seminal contributors to inclusive education, or writers of scholarly material on very specific areas. Given the multitudinous range of material available online, attempts were made to draw on scholarly material in this review. An examination of all associated material available through both hard and electronic mediums proved too time-intensive, and may perhaps be reserved for another investigation. Studies were restricted to the 2014–2020 period to offer a more contemporary scope. Each study was perused for method and research design, with the search procedure recorded in the bibliographic database, EndNote. Studies were noted with regard to size, location, methods adopted, results and possible recommendations. The literature search did present challenges, as methodological approaches in inclusive education varied across scholarly material. Many publications were focused on research design, while others adopted a more pragmatic view of inclusive education. Efforts were made to include both qualitative and quantitative studies, and to minimize bias through a thorough scoping of the literature in recent years. Whittling the wide range of research offerings to only a few studies offered a more detailed inspection of key indicators and allowed the researchers to offer more targeted comments. In this regard, we adopted a critical lens to sift out pertinent literature, paving the way for further refinements as policy and research in the field continues. Each component identified previously (Loreman et al., 2014), was examined through a more critical lens, with each analysis punctuated by a series of reflective questions. These questions, viewed compositely, will provide the basis to develop and refine inclusive education programs more universally. To enable an update of the indicators for inclusive education, the authors drew on the same three components (input, process and output) and 14 themes as those highlighted in the original review (Loreman et al., 2014), however, the dialog now includes apprised ideas as they emerged from more recent publications. Input is everything provided by the system to achieve inclusive education, processes are practices that transform the ways of working with learners and their families, and outcomes are the results or effects of the combined efforts of input and process (Loreman et al., 2014). We present a few questions under each theme that readers may find useful to guide their inclusive education efforts.

Component one: inputs

Theme one: policy

Policy and legislation provide a roadmap to implementing inclusive education initiatives. There are often some gaps in the intent of an inclusive education policy and its implementation. It could be said that most policy documents outline “what” needs to be done. They do not always outline “how” it (i.e., there is inadequate information about the implementation) should be done. Countries that have made significant progress in implementing inclusive education are those that have addressed both the “what” and “how” of inclusive education through their legislative documents. Loreman et al. (2014) identified four key features of effective inclusive education policies (a) the policy being aligned to the international standards and conventions (b) policy being revised and modified in consultation with the members of schooling community including parents, students, teachers and staff (c) policy targeting barriers to achievement of all learners through joint involvement of all members and (d) policy being explicit in identifying and providing resources to support inclusive education. Recently, UNESCO (2020) in its *Global Education Monitoring Report* highlighted that an inclusive education policy should address three key areas of: non-discrimination, zero reject and reasonable accommodation. The principles of non-discrimination and zero rejection are self-explanatory. They require that we should make sure that all learners have access to education regardless of their race, religion and/or abilities. The principle of reasonable accommodation requires educators to think about how best the schools can individualize and personalize curricular activities without stigmatizing learners.

The following questions could be helpful in evaluating a policy:

- Does the policy clearly outline who should be included as well as how an individual student would be included?
- What support and resources would be made available to schools to include the learner?
- Does the policy outline a monitoring mechanism to determine the success of inclusive education efforts in terms of key outcomes for a marginalized learner (e.g., improve presence, participation, achievement, acceptance, belongingness and happiness of the learner)?

Theme two: staff professional development and teacher education

Teaching in inclusive classrooms requires that teachers are adequately prepared to teach learners with a range of diverse profiles in regular classrooms. While teacher education programs should establish systems to ensure that all graduate teachers leave the programs with adequate knowledge and skills; schools should also provide adequate professional learning opportunities for in-service educators to update and acquire new skills to include all learners. The *Global Education Monitoring Report* (2020) analyzed data from 168 countries and found that 61% of teachers received training in some aspects of inclusion. The report did not collect any data about the coverage or quality of the content. The report further outlined that despite teachers reporting that they are trained and qualified to teach, many were still concerned about their lack of skills to teach vulnerable children.

A critical aspect that must be taken into consideration when determining teacher readiness to include all learners is not just the quantity of skills acquired, but it should rather be about how well the training has prepared educators with the right kind of beliefs, knowledge and skills. A well-prepared inclusive educator is someone who understands the “what,” “why” and “how” of inclusive education; and who has the “heart,” “head” and “hands” of an inclusive educator. An effective inclusive teacher education program

should make the task of including learners with a range of diversities easier rather than make it more complex. There is some research which shows that teacher education programs can sometimes increase educator concerns about inclusion (Forlin and Chambers, 2011). Past research shows that too much emphasis on various disabling conditions could have a detrimental effect on educators' readiness to teach in inclusive classrooms (Florian, 2019). Teacher education as well as in-service professional learning programs should make clear connections between the theory and practice of inclusive education. Sharma and Mullick (2020) presented a new CHANGE framework that could assist teacher educators to bridge the gaps between theory and practice.

C—Collaboration between schools and university.

H—Hands-on experience in using inclusive teaching strategies.

A—Assessment of readiness as inclusive teacher.

N—Networking with other stakeholders.

G—Greater contact with learners with diverse learning needs.

E—Effective coaching support from mentor teachers.

Sharma and Mullick (2020).

Teacher education programs should also provide ample opportunities for participants to apply the newly acquired knowledge and skills in real classrooms. Some questions to determine teacher readiness to teach in inclusive classrooms may include:

- Do educators have skills to determine how each learner is different in terms of their learning ability and preferences?
- Do they know about local policies and legislation that support inclusive education, and are they knowledgeable in acquiring necessary resources to teach all learners including those with disabilities?
- Do they know how to group students in mixed ability groups to ensure that learning outcomes are maximized for all learners?
- Do they know what should be taught (not just the content) to different learners based on their abilities and interests?
- Do they have skills to determine if a learner has learned the content?
- Do they have skills to motivate all learners?
- Do they have skills to effectively involve parents and other stakeholders?
- Do they know how to adapt the curriculum and use existing resources?
- Do they know how to personalize the content?

Theme three: resources and finances

A number of authors have noted that inclusive education without adequate funding and resourcing is unlikely to be successful (Banks et al., 2015; Slee, 2007). However, it is important to highlight that increased funding does not always mean that it would result in better implementation of inclusive education. Available funds need to be used effectively. Johnstone et al. (2019) state that increased funding should not necessarily contribute to increased labeling of certain students. It is critical to identify where funds are needed and how they are allocated. Some authors argue that additional funds if not used appropriately could in fact contribute to more exclusion (Slee, 2007; Sharma and Vicek, 2021). For example, in order to support learners with a disability some jurisdictions require that assessments be conducted to determine if a student has a disability. A large portion of funds thus could be spent in gatekeeping and in determining the eligibility of a learner to receive funding. The same funding could be more effectively used to provide support to all learners including those who need extensive support. Schools need not always rely on the availability of funds to start the process of inclusive education. They should rather become creative resource finders. We have learned some key principles that could guide how best to resource and finance inclusive education in economically advanced as well as emerging economies. The principles could also be easily used as key indicators to monitor inclusive education efforts.

- Are funds appropriated to the benefit of all learners?
- Does funding support the active establishment of inclusionary programs?
- Are financial resources used to support the most vulnerable in the school community?

Theme four: leadership

School leaders play an extremely important role in creating inclusive schools (DeMathews et al., 2020). They are gatekeepers of any change initiative. If they believe in an idea, they would find resources to implement the change. On the other hand, if they do not believe in an idea, both their overt and covert actions can slow down the progress of their school to become more inclusive of learners with a diversity. All actions of leaders, who are supportive of inclusive education, are influenced by their fundamental belief that inclusion and equity is a way to achieve excellence. These leaders pay particular attention to ensure that learners who are at the risk of marginalization or underachievement are fully catered for and well supported. They create school communities where both learners and teachers are well supported (Hitt and Tucker, 2016). Inclusive leaders have a common set of attributes that make their schools more inclusive of diversity. They convey a clear vision in support of inclusive education (Carter and Abawi, 2018; Hitt and Tucker, 2016). They are highly supportive of their school staff as they recognize that implementing inclusive education is not easy and without supporting the staff any attempts to implement inclusive education will fail (DeMathews et al., 2020). The critical support that teachers need to teach in inclusive classrooms relate to availability of additional time to plan and access to quality

professional learning opportunities in inclusive education. Past research has also found that inclusive leaders build a community of practitioners and collaborate with other organizations to implement inclusive practices. The following questions may assist to determine if a school has a supportive leader to promote inclusive practices:

- Can the school leader present a strong rationale for the school to be inclusive of diversity?
- Does the leader frequently attend professional learning events that can build the school's capacity to be inclusive of diversity?
- Does the school staff frequently undertake professional learning activities in inclusive education?
- Does the leader actively participate in critical inclusive education policy/planning meetings?
- Does the school use some system of data collection to determine if the school is making progress in implementing inclusive education?
- Does the school leader spend time with learners (as well as their carers) who are at risk of being marginalized?
- Does the staff feel fully supported in their efforts to implement inclusive practices?

Theme five: curriculum

The dialog focusing on the curriculum of inclusive education programs continue to feature on a global scale as more research and enhanced policy documentation is constructed to facilitate this (Lawrie et al., 2017; McMurray and Thompson, 2016). Curriculum is central to a well-functioning inclusive program, as its design and construction principles should be accommodating of student diversity, and incorporate the principles of Universal Design for Learning (UDL). Consequently, rigorous and authentic inclusive curricula should involve multiple forms of representation, engagement and opportunities, to accommodate a range of student needs and learning profiles. Using the micro and macro approach, individual education departments can construct curriculum that is collectively cognizant of the needs of many, while still being mindful of the needs of individual students (Lawrie et al., 2017; McMurray and Thompson, 2016). Personalized instruction continues to be accommodated through individual education plans, especially with regard to those students who require more intensive support. Individual Education Plans (IEPs) should be strengths-based documents that are constructed to highlight the accomplishment of goals (Timothy and Agbenyega, 2018). The establishment of appropriately responsive and inclusive curricula is therefore fundamental to contemporary educational programs which accommodate diversity. Furthermore, the voices of parents and caregivers are fundamental to accurate inclusionary curriculum design and planning (McMurray and Thompson, 2016). More recently, the use of multi-tiered systems of support have become primary to inclusive curricula, with schools around the globe being attentive to student needs first (Sailor et al., 2018; Witzel and Clarke, 2015). Educators need to plan curricular activities keeping in mind that in most teaching activities there will be some students (around 10–15%) who would need additional support to learn the content. They also need to plan for those students who would need even more extensive support (approximately 5%) to learn the content. The multi-tiered support of teaching and planning is a new way of thinking to support learners who need various degrees of support and it could be easily applied in all contexts. The following questions may trigger reflection relating to the construction of an inclusionary curriculum:

- Is the curriculum framework adaptable and malleable to accommodate student needs?
- Are universal design principles elemental to the construction of inclusive curricula?
- Is the curriculum centered around strengths-based principles?
- Does the curriculum draw on evidence-based strategies?
- Are multiple-tiers of support utilized to accommodate different student needs.

Component two: process

Theme one: climate

School ethos, which is sometimes referenced as school climate or school culture, is acknowledged in the *Global Education Monitoring Report* (2020) as crucial to inclusion. The report reveals that some governments identify ethos, or climate, as a prerequisite, a starting point, to inclusive education (United Nations Educational Scientific and Cultural Organization, 2020). Positive school climates have been associated with welcoming attitudes which foster social and emotional development and improved student behavior (Goldberg et al., 2019; Schachner et al., 2019). At the outset, school frameworks are essential to sustain inclusion, with these frameworks including the voices and contributions of parents, staff, students and the wider community. Such frameworks should incorporate a range of student needs that are not necessarily limited to disability, but should utilize any factor that could lead to marginalization or vulnerability. Responsive and inclusive schools create sanctuaries where students can seek help to deal with trauma, stress or illness. This could be facilitated through clinical, and psychological services, with qualified and skilled staff available to aid students. Marginalized students may bear the misfortune of bullying; however, an established inclusive ethos is likely to minimize and combat bullying rates, reducing the adverse impact on students (Hartley et al., 2015; United Nations Educational Scientific and Cultural Organization, 2020). Establishing management practices, and readily visible expectations assist in maintaining inclusive school culture. Additionally, adopting the tenets of Universal Design for Learning is also key to accommodating all students, with these inclusive practices being monitored through constant evaluation and assessment. Technology is likewise

considered central to inclusive schooling in contemporary settings, with access for all students being primary to its implementation. Pragmatic questions which may be posed when constructing an inclusive climate are:

- Is there an explicit means of welcoming students into the school?
- Is there a documented and easily accessible framework to assist with the creation of appropriate inclusive climates?
- Are there sanctuaries or safe places to which students may withdraw to receive personalized support?
- Is there an agreement to manage bullying and aggressive behavior?

Theme two: school practices

Schools are required to implement management and guidance services to encourage inclusivity (United Nations Educational Scientific and Cultural Organization, 2020). School communities should actively embrace the tenets of these services to reduce the marginalization of any student. Villa and Thousand (2016) acknowledge foundational beliefs that schools should embrace when restructuring for inclusive practice. These include, among others, an awareness that all students can succeed, and that diversity within the school can enrich every student (Villa and Thousand, 2016). Inclusivity, therefore, is not just a school practice, but an embedded belief that alters the mindset of staff, parents and students (Villa and Thousand, 2016). School practices should consider the complexity of individual student identities, reflecting on their needs as individuals (Brown, 2019). Research notes that creating spaces to interact within schools is the first step, rather the establishment of inclusive norms which welcome, invite and include in a deliberate and intentional sense becomes elemental to inclusive school practice (Brown, 2019). In this regard, professional development and guidance to the school community at large is primary to the success of these practices (Brown, 2019). For example, inclusive programming of student needs in Singapore is a progressive initiative still in its infancy, however guidelines that support this restructuring include an intensive understanding of how the school experience is academically, socially and emotionally fulfilling for every child (Yeo and Tan, 2018). As schools examine their practice as inclusive institutions, they should be prompted by the following questions:

- Do any of the school practices marginalize students?
- Does the school explicitly acknowledge that every child can succeed?
- Is there an awareness that diversity is to be celebrated?
- Have overt attempts been made to alter the mindsets of the school community?
- Does the school incorporate the view that student identities are complex and multi-layered?

Theme three: classroom practices

Contemporary inclusive education should reduce the potential for the marginalization of vulnerable populations within mainstream or regular classrooms (United Nations Educational Scientific and Cultural Organization, 2020). Modern education systems are now embracing social equity models, with increased numbers of students with disabilities now being educated alongside their differently-abled peers. Consequently, indicators of effective inclusionary practice within classrooms should include aspects that ensure that these vulnerable populations are not stigmatized within inclusive classrooms. The classroom becomes a microcosm where other inclusionary elements are practiced and implemented at close quarters. The inclusive classroom becomes the specific space where policy and values transform into practice. Accommodating student diversity through individualized practice and authentic differentiation is at the core of effective inclusive programming within this context. In the African context, this reflection on “othering” can be detrimental to the social norms that are being embedded (Phasha et al., 2017). Creating belonging and shared ownership are crucial indicators of inclusive classrooms in the African context (Phasha et al., 2017). In Africa, the philosophy of “ubuntu” is central to inclusive classrooms, embracing the shared experiences of human beings (Pather, 2019), and reflects the notions of togetherness, attachment and sharing. In Africa, teachers within special schools often possess skills and knowledge that could be transferable to a mainstream setting (Pather, 2019), however opportunities for collaboration are limited. Equipping teachers with skill and knowledge relating to authentic differentiation, and inclusive practices are elemental to sustain the practice (Donohue and Bornman, 2014). Concrete considerations emanating from studies in Sub-Saharan Africa and many other countries, with regard to classroom practices, reflect the following key ideas:

- The establishment of inclusive philosophies, such as belonging and ownership, within classrooms that are values based.
- Professionally developing mainstream teachers to ensure that they are equipped and feel confident with differentiating instruction for differently able students.
- Creating communities of practice between more specialized settings and mainstream schools to ensure a flow of ideas, strategies, and techniques to accommodate student diversity.

Theme four: collaboration and shared responsibility

Ensuring equal educational opportunities for marginalized populations has appeared in inclusive studies previously, but the *Global Education Monitoring Report* (2020), suggests that all collaboration in theory is not sufficient. They imply that stakeholders mobilize

within any given inclusive context, to align with the needs of vulnerable populations and offer direct systems of support (United Nations Educational Scientific and Cultural Organization, 2020). They reference a vertical and horizontal approach, calling on the school, parents and teachers, government departments and other stakeholders to become active collaborators in this shared task (United Nations Educational Scientific and Cultural Organization, 2020). Shared responsibility of this nature is more likely to tap into available resources and utilize these more efficiently. In economically emerging countries collaboration between schools as well as between schools and community organizations is critical. It ensures that the countries can make the best use of the existing material and human resources. The *Global Education Monitoring Report* (2020) cites the example of Serbia's government which established a streamlined coordination mechanism to support all children within schools. A coordinated approach of this nature is challenging, due to financing structures, and agreement between contributing service provider (United Nations Educational Scientific and Cultural Organization, 2020), however effectual support for students from marginalized populations is only possible if service organizations adopt a common focus, without the impediment of bureaucratic prerequisites. Another example cited in the *Global Education Monitoring Report*, is of Sierra Leone, who established a national commission armed with the sole focus of recognizing the rights of individuals with disabilities and providing access to appropriate services (United Nations Educational Scientific and Cultural Organization, 2020). In establishing these structures within inclusive settings, the following points provide for pragmatic reflection:

- How can schools and educational institutions collaborate with stakeholders to maximize the provision of support to vulnerable students?
- What are the mechanisms that can be introduced into these collaborations to ensure that they achieve their goals promptly?

Theme five: supports to individuals

Individualized and personal support is often necessary to support additional needs within an inclusive setting (Sharma and Salend, 2018). These systems of support offer universal support (85% of students), care for smaller groups (11% of students) and more intensive maintenance of individual student needs (about 4% of students) (Sharma and Salend, 2018). Such supports more effectively address the needs of students, clarify the goals and implementation of plans of support to paraprofessional staff (Sundqvist et al., 2019), and ultimately ensures that individual student needs are being accommodated. Utilizing these systems of support scaffolds the work of teachers, framing their selection of differentiated strategies to suit whole-group, small group, and individual student needs (Giangreco and Suter, 2015). Aligning with Universal Design for Learning, these systems of support, caters to the needs of all students. Platforms of support are generally valued and beneficial to all students regardless of ability. Student diversity within mainstream settings will continue to change, and their learning profiles should be accommodated within the inclusive classroom. Of importance is the need to collaborate with support staff, shifting from the dated exclusionary "pull out" model, and support students within the classroom (Giangreco and Suter, 2015). Altering support programs in this manner has implications for teacher education and school administrators who will need to change their focus so that these tiers of support become the stimulus for altered programming and planning (Giangreco and Suter, 2015). As these Multi-Tiered Systems of Support become established in inclusive schools, the following reflective questions may be constructive:

- Do planning meetings embrace the varying tiers of support offered within the educational institution?
- Is there collaboration between teachers and paraprofessional staff?
- Are there individualized support structures in place for students with more specialized needs that draw on evidence-based practice, differentiated instruction, and the Universal Design for Learning?

Theme six: role of special schools

The role of special schools in the inclusion agenda remains an element of considerable discussion and debate. There have been mixed responses about whether a special school setting provides more intensive care when compared to the mainstream context. Special schools may continue to feature in the educational landscape, however there are indications that partnerships between specialized settings and mainstream schools may forge links (Shaw, 2017), improve awareness of disability and equip teachers with essential skills. In a study documenting shifts in inclusive policies in Portugal, Alves (2019) notes that national strategies are often influenced by international dialog. Some European countries, like Portugal, closed special schools, however more recently, these special schools have been constructed as resource centers (Alves, 2019). Educationalists are cautious however that these resource centers do not become institutions that segregate. While the closure of special schools is generally viewed as positive, mainstream schools should be appropriately equipped to accommodate student needs, through the provision of specialized equipment, resources and staff (United Nations Educational Scientific and Cultural Organization, 2020). Additionally, an individual school's response to diversity, the collaboration of this institution with others around them, and the wider social and cultural policies which impact on inclusive education, are integral to the successful implementation of socially just inclusion (Ainscow, 2020). In reflecting on the role of special schools, the following factors may be central:

- Can specialist schools and special development settings be used as resource hubs rather than locations of segregation?
- Can staff collaborate to ensure that student experiences in mainstream settings are positive?
- Does the mainstream school possess the capacity to include students with additional needs and disabilities?

Component three: outcomes

Theme one: participation

Student participation often enters the literature on inclusive education as a key marker of an effective program. In fact, many education departments around the globe are keen to enhance participation and involvement on the part of students with disabilities. Funding is often invested in a range of resources to encourage participation in this context. A Kenyan-based study revealed that collaboration between parents, the community and schools often have a positive impact on school participation of students with disabilities (Elder and Kuja, 2019). Involving the community increases societal sensitivity to issues related to disability, and is likely to reduce boundaries, allowing students with disabilities to participate in and access educational opportunities more freely. Furthermore, the study reported that the creation of committees which stimulated discussion, and highlighted needs relating to the participation of students with additional needs, was constructive. This model was expected to be replicated by other educational regions in the country. Aligned to this, another study contextualized in Barbados, points out aspects that should be included in inclusive education policy to increase student participation (Blackman et al., 2019). These include explicit guidelines and policy relating to inclusive education; greater collaboration between mainstream school teachers and special education teachers; the use of intentional plans to increase the involvement of students with disabilities in mainstream settings; including a mandatory learning unit into teacher education programs which will enhance knowledge and skill relating to the inclusion of students with disabilities into regular classrooms; and increasing contact with parents of students with additional needs so that these partnerships can inform the inclusive education plans being created by the school. While data on participation remains subjective and there are few yardsticks to measure actual participation, it is evident that the creation of communities can be valuable in enhancing involvement. For schools that are encouraging participation, the following reflective questions may be useful:

- Are inclusionary plans constantly evolving and under review?
- Are parents and other stakeholders included in discussion relating to student participation?
- Are there collaborative discussions within communities relating to the participation of students with disabilities into the wider community?

Theme two: student achievement

Student achievement is at the forefront when considering any effective inclusionary program, with much of the research in the field examining whether students meet their academic goals. In another related study on inclusive education measures in the Australian context, Anderson and Boyle (2015) acknowledged that there are limited guidelines to evaluate inclusive education, leading to varying levels of success with regard to student achievement. Introducing indicators of success acts as a means of evaluating inclusionary programs, especially as they align to student achievement (Anderson and Boyle, 2015). However, research is divided about the effects of inclusive education in relation to student achievement (Dell'Anna et al., 2019; Krammer et al., 2019). Some studies, utilizing a more philosophical and social justice framework, consider interaction, the participation of students with disabilities into mainstream education, and equal access, as markers of achievement (Haug, 2017). In a paper which highlights the growing achievement gaps for students with disabilities in regular class settings, Gilmour et al. (2019) expressed some reservations about whether student needs were being met appropriately. However, their meta-analysis conceded that more research into the area is warranted. Reading and literacy gaps were of marked concern. Other studies link student achievement with teacher practice, highlighting the need for more research-based pedagogies, curriculum differentiation and staff development with regard to accommodating students with disabilities, as triggers to enhance student achievement (Lancaster, 2014). The following reflection questions may prove helpful when considering the achievement of students with disabilities:

- What forms of data are available to measure student achievement?
- Is student achievement limited to academic output, or does it extend to social contribution and interaction?
- Do teachers possess an inclusive mindset when considering student output?
- Is assistive technology used to support students with disabilities in inclusive settings?

Theme three: post-school outcomes

Post-school outcomes are important for all students, but especially so for students with disabilities. From a human rights perspective, many researchers acknowledge that all students should eventually find their place in wider society. Research acknowledges that transition programs and high-quality curricula are important baseline indicators of post-school outcomes for students with disabilities. Schools play a critical role in the transition of students from more structured settings to workplaces and tertiary education (Joshi et al., 2012). Furthermore, bridging programs and other support services should be available to facilitate the shift from school to the workplace or other locations of study (Bouck, 2014). Schools could embed syllabi which offer structured ideas relating to independent living and post-school support (Bouck and Park, 2018; Bouck, 2014). Participation in work-related activities, or work-experience, for example, are usually valuable transition activities to support movement from school to employment. Schools could also assist with matching work options with student profiles to facilitate the post-school shift. Additionally, where appropriate, schools could empower students with disabilities with soft vocational skills, social skills, and information on how to secure

and hold employment (Bouck and Park, 2018). Post-school venues, such as colleges, universities, and other learning centers could also arrange programs that replicate those arranged within schools, to increase participation and reduce challenges for students with disabilities (Bouck and Park, 2018). These programs could offer modifications to the academic units as relevant and appropriate, thereby ensuring course completion and student retention. The following questions may serve as good points of reflection when considering the post-school outcomes of students with disabilities:

- Are transition and bridging programs available and tailored for students with disabilities?
- Are units of work incorporated into school curricula that appropriately prepare students for post-school options and living?
- Are soft skills included in school programs for students with disabilities to facilitate their transition from school to post-school study or work?
- Is there an established relationship between post-school settings (colleges and universities) and schools to facilitate the movement from school?
- Are post-school centers equipped to accommodate individuals with disabilities, with regard to social integration and academic support?

Discussion

Implementing inclusive education is not easy. Past research has shown that some systems around the globe have struggled to implement inclusive practices for many reasons. However, there are also countries and systems around the world that have made remarkable progress in implementing inclusive education. Successful case studies are evident both in economically advanced (e.g., New Brunswick in Canada, Italy, New Zealand) and economically emerging nations (e.g., Peru and Bangladesh). The contexts mentioned have risen to the challenge of providing more equitable educational opportunities for all students, particularly those with disabilities, and implies that economic advantage may not be a determining factor in the successful implementation of inclusive education. The common elements across the systems that have made progress in successfully implementing inclusive education relate to holistic efforts of all key stakeholders (e.g., policy makers, educators, parents and community members) and use of context sensitive practices. As systems across countries begin their future efforts to create inclusive schools, the questions that are often asked are: "where do we start" and "how would we know if we are making any progress." This paper attempted to answer both these questions. It provides a contemporary review of the most critical inclusive education indicators that any system can use to guide their efforts. We believe the indicators reported in this paper are relevant to all countries irrespective of the economic status of the country. Inclusion can only begin when everyone believes that it is a way to achieve excellence for all learners. We have taken care in identifying and reporting indicators that are sensitive to different contexts. We do not make the claim that the indicators be used blindly without paying close attention to the local context. A useful exercise to ensure that the indicators are culturally appropriate and context sensitive may involve close collaboration among policy makers, educators and community members. Our past experience in the Pacific indicates that such exercises can result in creating indicators that are highly valued by local stakeholders and are adopted by policy makers (Sharma et al., 2018). Workshops could be conducted where all key stakeholders come together to discuss, debate and refine the indicators for the local contexts. The newly developed/adopted indicators will be owned by local stakeholders and would have better chances of being adopted at a wider level. We believe this paper has provided a broad framework that countries across the globe can use to create inclusive schools and societies where all learners will flourish.

Conclusion

Ultimately, this paper draws together a set of global indicators for contemporary inclusive school programs, utilizing the lens of social equity. These indicators should be viewed in the light of context-specific factors, being cognizant of individual locations and geographic dynamics. The paper acknowledges that care should be exercised when applying policy-borrowing as such a practice is often negligent and unmindful of local subtleties and the nuances of individual cultures. Inclusive education is likely to thrive when it is developed through a respect and awareness of a country's cultural and social norms. The 14 indicators identified in this paper will act as a platform to illuminate and refine processes that lead to a socially just inclusionary school program, that accommodates all students.

Introduction

For some considerable time, scholars and education practitioners have more or less settled on an array of principles regarding what constitutes genuine and effective inclusive education. While there may be some minor disagreements around the margins of these principles, they have in general proved relatively stable over time (conservatively, we say, for at least 20 years). Schools and school systems have purported to be making progress on implementing various principles in practice, and in doing so have been able to lay a claim to being an inclusive school or system.

Although inclusive education means that every learner is valued while receiving quality and equitable education (Sharma et al., 2020), the extent to which both the philosophical premise and inclusive education practices have been truly and seamlessly integrated into education has, however, recently been exposed as a result of the international crisis caused by COVID-19. In his novel *Memoirs of a Geisha*, Arthur Golden (1997, p. 405) remarked that "... adversity is like a strong wind. I don't mean just that it holds us back from places we might otherwise go. It also tears away from us all but the things that cannot be torn, so that afterward we see ourselves as we really are, and not merely as we might like to be." Actions taken in order to meet the imperatives of the COVID-19 state have exposed significant flaws in the approach to inclusive education, demonstrating that in many respects the inclusive education emperor, with all its feel-good promotional value, has no clothes. Arguably, in the rush to adopt alternate modes of educational delivery, the principles of inclusive education have too often been set aside, and many already marginalized learners have been simply abandoned. It is this issue, in itself, that has led us to this commentary—in the midst of a global pandemic—that can shed more light on the critical issues surrounding inclusive education. In this chapter, we first discuss a number of key principles that have guided inclusive practices in schools globally. Later, we provide commentary, based on evidence, as to whether or not these principles continued to guide school practices during the COVID-19 state.

Inclusion or exclusion

Inclusive education can be observed from two vantage points, which are not mutually exclusive and which can interact and co-exist. For the sake of distinction, the two vantage points might be described as positive and negative:

- *Positive.* The first vantage point, positive, involves adding to and changing existing structures to support more inclusivity. For example, it may at times be appropriate to add a teaching assistant (also referred to as an *educational assistant*) to the complement of classroom staff in order to help facilitate the type of educator-learner interaction a particular situation demands. Positive views of inclusion such as this might involve checklists of the sorts of resources and practices that must be evident if a school is to be considered inclusive. These checklists can change according to context, but there are elements common to most.
- *Negative.* The second vantage point, negative, involves the removal of barriers to support more inclusivity. Some leading researchers, beginning with Peter Mittler (1979), and later Tony Booth (1995), Slee and Allan (2001), and many others, speak of inclusion as being the removal of things that exclude. Operating under this paradigm, it is the role of the inclusive educator to

identify the sorts of practices, structures, and attitudes that serve to exclude some groups of children, and then work to remove those barriers, if necessary replacing them with more benign elements in order to become more inclusive.

Clearly, the terms positive and negative are not used here in a punitive sense. They are not to be equated with “good” or “bad”. They are applied here because one vantage point involves adding to and modifying an experience, while the other involves the removal of barriers to student engagement and learning. Done well, both can be observed as being helpful to furthering the process of inclusion in the learning environment.

The way in which schools implement inclusive practices may look different in different classrooms, in different schools, and in different countries. However, there are some common elements that need to be understood. Inclusion is a process; it is not a product. Inclusion is a journey; it is not a destination. Inclusion requires that learners are supported based on their needs. It means that sometimes we need to have unequal resources in our schools to address equity and diversity. Inclusion necessitates that we pay as much attention to supporting educators as we pay to supporting learners. Without adequate support to educators, schools may not initiate or sustain efforts of educators to create inclusive classrooms.

Principles of inclusive practice

The right to education is one of the most important rights for persons with disabilities.

World Bank Group (2020, p. 10).

The goal of inclusive education is for education to provide optimal learning experiences for all learners in ways that do not create or perpetuate the marginalization and exclusion of individuals or groups. Three justifications to support inclusive practices in schools globally are educational, social, and economic (UNESCO, 2009, as cited in Sharma, 2020). According to Sharma (2020):

- the educational justification is that all learners, irrespective of any differences, must learn together with inclusion benefitting all learners,
- the social justification points to inclusion being perhaps one of the simplest ways to modify learner attitudes toward each other and create societies where all individuals belong, irrespective of any differences, and
- the economic justification suggests that inclusive education follows a cost-effective measure to educate pupils with diverse learning needs.

It is here that context matters. There is no “one size fits all” model of inclusive education that can apply to all countries or often even systems within countries. For example, in a recent study focusing on inclusive education across the Pacific Island countries, Sharma contended that, along with some similarities, there are stark differences in terms of population, resources, languages spoken, and socio-cultural practices and religious backgrounds, which directly impacts inclusive education efforts. It is, therefore, necessary to examine specific educational contexts, decide which practices marginalize learners, and then work to change those practices by transforming or augmenting systems and specific ways of educating. Principles of inclusive practice that have been recognized as being important considerations have been enumerated and described. Some, such as placement, are obvious. Others, such as the role of home/school partnerships, less so. Fig. 1 outlines common principles associated with inclusive education, starting first with a philosophy of inclusion and desire to do it.

Based on various viewpoints presented and debated in the international literature, the features of inclusive school systems referenced in Fig. 1 include:

- *Pro-inclusion policy and legislation* (Armstrong et al., 2010; Mittler, 1979). Cohesive, inclusive systems and schools can be built only with great difficulty in the absence of guidance from governance bodies, including elected politicians and school authorities. Legislation and policy provide a road-map, ensuring that rights and expectations are defined, and educational mandates for inclusion are specified. In systems governed by weak inclusive education policy, greater opportunity for exclusion exists and occurs.
- *Home/school partnerships* (Christenson, 2004; Goodall and Montgomery, 2014; Hornby and Blackwell, 2018). Families are a child’s first teacher, and learning occurs best when the gaps between the home and the school are reduced. Working in partnership, families and schools can work toward common learning, social, and other goals, and engage in information exchange so as to provide a more holistic view of the learner.
- *Adequate resource provision* (Goldan et al., 2021; Starcic, 2010). It has been known for some time “... that the quality of the organization seems to influence the delivery of the service as much as the overall level of resources” (Sebba and Ainscow, 1996, p. 9). In other words, more money is not the answer to improve inclusion. However, it is the case that adequate resources need to be in place in order to optimize learning for all. These include adequately trained educators and other service delivery personnel, appropriate technology, and any number of other materials based on specific learning contexts and learner needs within those contexts.
- *Positive attitudes and welcoming, learner-friendly environments* (Ahmmed et al., 2012; De Boer et al., 2011; Schwab et al., 2018). Positive attitudes and commitment of all key stakeholders (e.g., educators, school leaders, family members and other members

Fig. 1 Principles of inclusive practice.

of the school community) toward the inclusion of all students are critical to the success of inclusive education. Based on these positive attitudes, welcoming school cultures can be developed in which no child is turned away, but is rather embraced as an important and valued school community member.

- *Teacher professional readiness* (Mittler, 2000, 2010; Movkebayeva et al., 2016). Teaching in diverse classrooms requires skillful employment of pedagogical techniques, and the ability to engage in assessment *for* as well as *of* learning. Among other demands, teachers must be skilled at facilitating social and emotional development, working with families, planning, and creating learning experiences that include all students.
- *Use of inclusive pedagogical approaches* (Bradford et al., 2021; Deppeler et al., 2015; Katz, 2013; Loreman, 2017). While a number of pedagogical approaches that aim to facilitate inclusion exist, the one that has garnered the most attention in recent years is known as Universal Design for Learning (UDL). UDL (Katz, 2012) is premised on the provision of multiple means of learner engagement, multiple means of representation (or how content is presented), and multiple means of action or expression which can provide a basis for assessment.
- *Common, flexible curricula* (Mittler, 2000; Norwich, 1990; Operti et al., 2009). The design of school curriculum in many school jurisdictions presents barriers to inclusion. Ideally, a single, common curriculum for all learners exists; one that is broad enough to account for a spectrum of learner interests, abilities, and needs. In practice this has been difficult to accomplish, as evidenced by the presence of alternative curricula for some children, or individualized education programs that have little in common with the general school curriculum.
- *Barrier-free environments* (Ackah-Jnr and Danso, 2019; Erkilic and Durak, 2013). It is self-evident that if a pupil cannot physically access their classroom, they cannot be included. The same can be said of learning environments that, for example, are not equipped with specialized technology to assist learners with disabilities such as deafness or visual impairment. Some environments present cultural barriers where cultural sensitivities are not respected. New educational settings should be constructed with the idea of universal access in mind. Existing buildings should be retro-fitted as required.
- *Age-appropriate heterogeneous learner groupings* (Luciak and Biewer, 2011; Mitchell, 2015). One of the important features of inclusive education is that learners are included in diverse, heterogeneous groups with their same-age peers (in settings where learners are typically grouped by age) regardless of their academic or social and emotional development and capacities. This context best promotes the academic achievement of all, along with appropriate social and emotional growth.

- *Support for the social and emotional development of all learners* (Katz, 2013; Reicher, 2010; Taylor and Sidhu, 2012). Schools have always taught more than straight academic content. Inclusive schools emphasize appropriate social and emotional development of all learners, encouraging positive interactions and the development of prosocial skills, attitudes, and habits.

Moreover, inclusive education involves identifying and overcoming barriers to quality education in the mainstream education system; reasonable accommodation of the individual's requirements; and provision of support to school personnel to facilitate access to and participation in effective quality education for all (Sharma, 2020). That said, inclusive schools demonstrate an adherence to all principles described above, with most schools falling within a continuum of inclusive practice. Inclusion is a process, and schools that embrace inclusion have chosen to commit to embarking on that process of constant improvement and reflection.

International crisis: COVID-19

The coronavirus (i.e., COVID-19) originated in Wuhan, China, in late 2019 and quickly spread internationally, becoming a pandemic on a global scale not seen since the Spanish Flu of the early 20th Century. The final death toll from the virus, that has spread into a "global public health crisis" (UNESCO, 2020a), is yet to be fully realized, but at the time of writing this chapter there have been 189 million cases internationally, and 4.07 million deaths (COVID-19 Statistics, 2021). According to Sharma et al. (2020), writing in the midst of the epidemic, the more aggressively a country implemented medical containment measures, the more success it had in minimizing the public health crisis and the associated cost. Following some initial hesitation, countries around the world faced with local COVID-19 outbreaks implemented containment measures, some more aggressive than others. Italy, for example, mandated almost complete lock-down in response to skyrocketing infection rates, banning most citizens from leaving the immediate surroundings of their homes (Zampano, 2020). Other countries, such as Brazil, were perceived to lack the political will and strategy to implement very much at all in the way of containment measures, with President Bolsonaro downplaying the virus as a "little flu" (Picheta et al., 2020; Walsh et al., 2020). Moreover, as widely noted, other political leaders have responded to COVID-19 in a manner that may be perceived to reflect a complete disregard for scientific research, even so far as when being advised that COVID-19 could lead to a "mass loss of life" (Graham, 2020).

Beyond the ways that countries have responded to COVID-19 (e.g., closure of retail, parks; decreasing modes of available transportation; pausing sports seasons), what is of interest to us is how these nations—or closer to home, *local governments* and *school divisions*—have chosen to deal with schools. Part of the overall containment measures in many countries meant a swift and relatively sudden closure of schools. In many cases, schools shifted immediately to online delivery with only a few days' notice (in some cases, less than one day) around mid-March 2020, with students being expected to learn from home with support from their teachers in the form of video classes, phone calls, emails, homework assignments, discussion groups, and other physically-distant means. This remained the educational model employed in the countries that adopted the "learning from home" model up until approximately late-June 2020 or later.

Objectives

Stemming from COVID-19, we wanted to discover what such a drastic and immediate change in education delivery meant to learners in marginalized groups and how that change impacted adherence to inclusive principles; for example, for new migrant children and youth, children and youth with disabilities, and children and youth living in poverty. Such research queries included:

1. How did school systems around the globe address inclusivity during COVID-19?
2. What can we learn from this current situation about how best we can address inclusion and equity in schools in the future?

Method

This review was conducted using an emergent (or inductive) methodological approach. We do not make a claim that we employed a highly systematic approach as it was not possible nor would have allowed us to achieve the key objectives. Although having read much on the impact of COVID-19 on marginalized groups of learners prior to conducting this study was what prompted us to write about it, we attempted to suspend any preconceived ideas, allowing the sources of information to dictate the various themes identified. A variety of sources were employed to collect data. First, an international group of experts on inclusive education were asked to provide us with relevant media articles or government or NGO reports about education inequities that were further exposed once school went online in much of the world due to COVID-19. These experts were all members of the international Consortium of Inclusive Teacher Education and Development (CITED) group.

Next, we conducted an internet search for media articles and reports from national governments or international organizations including but not limited to the World Health Organization, United Nations Educational, Scientific and Cultural Organization (UNESCO), and Inclusion International. We also searched a social media platform (i.e., Twitter) in an effort to discern responses (while identifying and delving into any articles that were frequently shared on social media) directly from the public. Such terms

that were used for the data search included, but were not limited to, the following: inclusive education COVID-19; diverse learning needs during COVID-19; educational change COVID-19. Each retained article, report, or tweet-related information was examined individually and retained or discarded on the basis of relevance. Within each piece of literature, we focused on additional supporting documents, articles and reports that were referenced in the ones we initially reviewed; we strategically reviewed literature that was previously cited so that we could go down a “rabbit hole” in order to delve deeper into relevant topic matter.

The information was sorted into themes as a means of ascertaining in which areas existing inequities were further exposed once school went online in much of the world (or at least our parts [i.e., Canada, Australia]) with analysis being conducted in an ongoing manner from the commencement of the text examination (Miles and Huberman, 1994). A theme was only retained if a number of other textual pieces cross-validated one another within that theme employing a method known as the constant-comparative method (Glaser and Strauss, 1967) where thematic information is constantly compared to itself and to new information in order to ensure that the chosen theme is accurate. This process is known as triangulation (Lincoln and Guba, 1985), and while generally reserved for the analysis of interview, observational, and other types of qualitative data, it can also readily be applied to document analysis (see also Loreman, 2013). Moreover, we ensured the consistency of themes was met through the passing of information back and forth along with sharing articles, reports, and organizational information among each other. Once themes seemed to emerge, discussion took place among the research team to ensure understanding how and why the theme was identified.

Results and discussion: issues exposed by COVID-19

Evidently, the principles of inclusive practice did not carry over entirely from the regular school process (i.e., classroom-based learning) to what became the “new norm” (i.e., learning from home) because educational systems had not fully embraced and internalized them. Resulting from our examination of the related literature, three themes emerged, including: overreliance on technology; changes in teacher assistant roles; and disconnecting relationships among students.

In mid-March 2020, students worldwide were asked to continue their learning through an online platform from their homes. At first glance, for those with suitable levels of technology in the home, this type of request may have been a minor inconvenience. However, for students without access to suitable technology and whose learning needs require more specialized levels of attention, this type of request may have led to profoundly negative results. That said, we have not even taken into consideration whether or not parents/guardians were available in the homes to assist students as young as 5 years old with their new online learning environment. Without adequate physical space and technology in the home, along with minimal familial support during the online learning activities, it seems clear that the online learning environment could, and did, involve many barriers for students. Hence, it is critical to decipher the ways that school systems—along with local and national governments—have not upheld the responsibilities of delivering quality education for all learners.

Overreliance on technology

Since the time schools moved to online learning, much has been written concerning adequate resource provision related to the COVID-19 state that has impacted the educational landscape. Hence, as students were asked to stay home during the epidemic, one major resource at home became a required learning tool—the home computer with internet access. Students were immediately forced into altering their “way of learning”. Although this may seem to be a minor inconvenience, it turned out to be a barrier that caused numerous issues for many students, including students with disabilities. Although students, along with their parents/guardians, became reliant on technology from home, it became evident that not all homes had adequate technology to ensure a quality education. Because of the overreliance on technology on the part of the schools, gaps became exposed between the “haves” and the “have nots”; the “digital divide” was apparent and widened across countries.

Several articles outlined ways in which inadequate resource provision has been a problem for students with diverse learning needs. Inequalities in student access to adequate technology for remote learning have been widely reported, and for many students with additional learning needs, the increased reliance on technology for remote learning contributed to more challenges and barriers (Sharma et al., 2020). As argued by McClain-Nhlapo (2020), although the COVID-19 state has relied heavily on educational technology solutions (e.g., computers, online learning portals), these learning tools were not always, or readily, accessible to learners with disabilities or complex learning needs. McClain-Nhlapo (2020) also pointed to the fact that internet accessibility proved to be an issue, when considering various locations across the globe (e.g., 2G, 3G, 4G access is not always possible). Although there may be a home computer available, without accessible internet connections, usually the home computer cannot meet learner needs. According to Strauss (2020), schools cannot provide access to learners by merely developing alternative online learning plans that are simply compliant with guidelines without considering deeply how each learner’s needs are being met.

Moreover, due to the overreliance on technology, home/school partnerships were negatively impacted. For example, Whitley (2020) discussed how parents/guardians who typically collaborate with school staff and community organizations were found to particularly struggle after the disappearance of face-to-face networks and collaborative partnerships in supporting learners. In fact, according to Whitley, some students who specifically thrive on predictable routines, struggle with transitions and rely heavily on deep-rooted teacher/student relationships built over time were found to be experiencing a range of negative emotions (e.g., worry, anger, sadness) with some believing they lost a second home without comprehending any reason. Likewise, in the midst of a clear lack of home/school communication in some instances, Preston (2020) discussed a situation in which, during the first

week of online learning, a student received a downloadable set of learning activities that included zero modifications or considerations toward the known diverse learning needs of the learner. Without the maintenance of strong home/school partnerships continuing into the COVID-19 state of schooling (i.e., learning from home), it is no wonder there have been learners with disabilities found to be communicating and expressing their emotions during this largely difficult situation in ways that are quite challenging for families (Whitley, 2020).

That said, numerous positive outcomes have arisen related to inclusive practices in the online learning environment. According to Sharma and May (2020), educators who have invested additional efforts in developing strong home/school connections reported improved engagement with all learners, including those with additional learning needs. Families that reported that the school was responsive to individual learner needs, such as by altering teaching and learning plans and providing additional resources, described more effective learning experiences for their children (Sharma et al., 2020). Likewise, some teachers made extraordinary efforts to facilitate remote learning by making efficient use of available technology in different parts of the world (Sharma et al., 2020). For example, some teachers provided their phone numbers to families so that they could contact them directly to discuss effective ways to support learners at home. Clearly, these teachers were inclusive as they were always thinking of addressing barriers that learners were facing and were discovering new solutions to address barriers daily; these teachers proved to be highly resourceful when taking into consideration barriers related to technology and home/school connections. They did not always know how to address all barriers, but they knew working in close partnership with families—building and maintaining strong home/school partnerships—they could address the “digital divide” to some extent. Moreover, in some of the economically emerging nations (e.g., India, Bangladesh), use of easily accessible multimedia (e.g., radio or TV broadcast of lessons) was employed to deliver lessons. Evidently, although technology-related barriers were found to exist, there were teachers who explored and discovered manageable ways to close the “digital divide” without particularly requiring excess amounts of new resources and funding. In a recent study, many families described how much they have valued the enhanced levels of communication with teachers throughout the COVID-19 state, reporting a more thorough understanding of their child’s learning needs (Sharma et al., 2020).

Changes in the teacher assistant roles

In some instances, a dramatic cut in education-related costs occurred during the epidemic with some school districts seeing their teacher assistants laid off. For example, in Alberta, Canada, the apparent cost savings associated with remote learning was used by the Government of Alberta as a reason for providing significant budget cuts to all Alberta school jurisdictions (Joannou, 2020; Macfarlane, 2020). According to Macfarlane (2020) in a CTV News report, “Education Minister Adriana Lagrange announced what she promised will be a temporary cut in order to redirect up to \$128 million to the province’s response to COVID-19.” Further, the report contended that, “... education assistants will be paid through the end of April ...”

Teacher assistant layoffs exposed two primary issues: (1) throughout the years, many teachers have delegated the responsibility of educating some students to teacher assistants and many of the criticisms of the cuts equated to teacher assistants being actual teachers for students with disabilities, and (2) on the other hand, the work of teacher assistants was legitimately justifiable for fulfilling a support role in the learning environment, even in a remote learning environment, which helped lead to successful student learning from home. The massive loss of teacher assistants led to significant negative results for students and, simultaneously, seemed to put a spotlight on a “perceived lower status” in the learning environment. When we refer to a “perceived lower status”, this is something we believe was communicated by the decision-makers to simply lay off teacher assistants. We (three authors) have all spent time in the classroom. We understand the necessity of qualified teacher assistants who are caring, knowledgeable, and experienced in fulfilling the duties as educational assistants in the learning environment (and that includes remote learning). Hence, we must ask what the perception of teacher assistants is from the decision-makers when laying them off seemed to be their course of action. More specifically, as alluded to in Heidenrich (2020), when referring to teacher assistants, along with other support services, they “were no longer working” during the school closures caused by COVID-19. When asked about this decision, a governmental Opposition Leader contended that teacher assistants are critical for remote learning success as they are required to assist students with learning challenges in the new online learning landscape (Heidenrich, 2020).

Conversely, there are examples in other countries where schools were more innovative in the way they employed and worked alongside teacher assistants (Sharma et al., 2020). For example, in Australia, schools allocated a small group of learners in an online environment to a teacher assistant for part of the lesson. The teacher assistant did not deliver the complete lesson, but worked with the allocated students to scaffold/reinforce the content covered during the lesson. The teacher assistants were alongside the classroom teacher in “breakout rooms”—a Zoom feature which allows the teacher to split the class into smaller groups. Moreover, teacher assistants were found to describe the importance of their role in keeping learners with diverse learning needs connected to school and classmates by employing a variety of strategies (Sharma et al., 2020). Some schools in Australia also continue to provide on-campus services to children and youth of essential service workers (e.g., nurses, doctors, ambulance staff) as well as to students who had very high learning support needs. As a result of Australia’s perception toward the importance of teacher assistants related to remote learning, teacher assistants proved to be instrumental in supporting all these learners during COVID-19. Hence, it seemed to really come down to the overall perception of what a teacher assistant role is—and can be—for the success of all learners. It is apparent from our discussion that two polarizing beliefs emerged when considering the roles and responsibilities of teacher assistants throughout the epidemic.

Disconnecting relationships among students

School closures due to COVID-19 precipitated a significant deterioration of peer relationships. In the case of students with disabilities, this was seen to be negatively impactful. Students became reliant on parental support to complete schooling, and oftentimes, the parent/guardian became a substitute peer for students. Because some parents/guardians had to remain working as essential workers, while others could not or did not support student learning for other reasons, some students were not fully included in the online learning community or received a second-rate education, for family reasons. This is presumably also the case when classes are face-to-face. COVID-19 simply highlighted that fact when it comes to the class community.

Moreover, important socialization needs were ignored in favor of an approach that focused only on the academic “basics”. This highlights that basic academics are still the focus of schools, and the rest operates on the margins. For example, [CBC \(2020\)](#) reported that in Alberta, Canada, language/literacy and mathematics/numeracy (K-3), with the suggestion of incorporating science and social studies (4–6), would be the primary focus during the remote learning stage. When considering social and emotional learning, one must ask what considerations took place in this decision for student learning. For example, it seems unrealistic that specific learning needs can be reached from home when such barriers include the complete absence of a class community. When considering support for social and emotional learning of students during COVID-19, consideration should be given to the importance of peer connections. According to [Whitley \(2020\)](#), connections with peers are critically important for students; the development and maintenance of friendships is not always easy for students with disabilities. As argued in [Whitley et al. \(2009\)](#), “... a number of studies have documented that when students feel engaged with and enjoy their school they are likely to experience high academic achievement and school completion ([Beran et al., 2008](#); [Buhs, 2005](#); [Finn, 1993](#); [Ontario Ministry of Education and Training, 2005](#)).” That said, numerous students rely on school-based friendships and may not have these peers in their home environments ([Whitley, 2020](#)).

Likewise, according to [Strauss \(2020\)](#), for many students with disabilities, meaningful access to a conducive learning environment means providing resources so that they can access the general education curriculum and be actively engaged in the learning community—a critical step toward developing a sense of belonging in today’s society. Further, a large portion of students with intellectual disabilities have been found to receive minimal to no access to the academic instruction or social and emotional learning that promotes a sense of belonging ([Strauss, 2020](#)). In addition, much has been written concerning positive attitudes and welcoming environments related to COVID-19 that has impacted the online learning environment. For example, it has been reported that the education systems have not adapted to meet learner needs, leaving up to as much as one-quarter of 15-year-old students globally reporting a sense of exclusion from the learning environment ([UNESCO, 2020a](#)). [UNESCO \(2020a\)](#) contended that COVID-19 actually further exacerbated exclusion in schools specifically because, in the Latin America and Caribbean regions, with only approximately one-quarter of the countries having inclusive education laws covering all learners, it is believed that inequalities will have increased throughout the COVID-19 state ([UNESCO, 2020a](#)).

Although much has been discussed when considering the deterioration of classmate relationships throughout the remote learning stage, there have been some effective measures taken to counter this issue. One such example, when considering students with disabilities, is the Special Friends Network, a grassroots organization operating in Ontario, Canada, that has organized Zoom learning sessions/meetings so that students with all types of disabilities are afforded opportunities to communicate, participate in games, and engage in artwork activities with peers ([Whitley, 2020](#)). This idea seems so achievable, when considering the online learning environment, and can help lead to many deep and lasting relationships while also affording opportunities for collaborative learning.

Moreover, as shared in [Gonser \(2020\)](#), the idea of trying to frequently reach out to say “hello” has been found to elevate peer relationships throughout the epidemic. Striving to ensure that students know that teachers are thinking about them, care for them, and miss them is a resourceful tactic to help build and/or maintain class relationships. That said, for learners with no internet access, it is suggested that teachers try to connect through a phone call and consider rotating through small groups of learners each day to make it a manageable task. According to a teacher, as shared by [Gonser \(2020\)](#), reaching out by calling each student can be quite time-consuming, but the teacher observed a positive outcome from such an effort to help build and/or maintain quality class relationships.

Likewise, when considering regular check-ins, a teacher has established an idea that students connecting with peers has become part of the class homework ([Gonser, 2020](#)). According to the teacher, each learner was assigned a task to connect with one classmate, and to report back to the teacher to share how the peer is doing on that particular day ([Gonser, 2020](#)). After modeling the effective communicative practice—including guidelines—for the students, the learners can choose how they want to check in (e.g., Email, Skype).

When considering the various ways that educators are striving to build and/or maintain strong class relationships throughout the remote learning stage, it again seems to be the resourcefulness of the teachers that plays an essential role in quality education for all learners. That said, perhaps the narrative around “more funding is needed” should be lessened and additional support for teachers to build and/or maintain strong class relationships should be discussed in more depth.

Principles of inclusive practice in schools

Building the plane, while flying

COVID-19 has changed the way we see and work in our world. That said, the educational landscape has also changed and educators worldwide are striving to adapt their practices—rapidly due to the pandemic—to ensure meaningful student learning occurs. Teachers are trying to become more effective in their practices in a time when levels of anxiety across whole school communities are at exceedingly high levels; they are building a plane, while flying. During the first months of the pandemic, much was discussed concerning teacher training when working with students with disabilities, and this has been further focused upon during the extended impact of COVID-19. According to [UNESCO \(2020b\)](#), a quarter of educators across 48 countries reported they would have liked more training for teaching students with disabilities. Further, in practice, school hours were drastically reduced since mid-March 2020 for online learning. As widely accepted by educators, some students require more time than others for practice and application of what they learn. Due to both the reduced timeframes given to the school day along with teacher unreadiness to teach students with disabilities, further exposure to a lack of real attention to the principles of UDL was brought to light throughout this study. As we carried out our objectives, we maintained a close focus on the two research questions (previously noted).

In this section, we focus on how schools have addressed inclusivity during the time when schools were closed and students were engaged in remote learning. Throughout the recent literature related to COVID-19 and meeting the needs of all learners, it is evident that not all principles of inclusive practice were adhered to. Hence, we will provide a commentary that will focus on much of what we found throughout this study.

First, when considering the home/school partnership, it is widely understood that often parents/guardians are a child's first teacher. They raise and educate their child(ren), ideally entering into a partnership with schools/teachers in that endeavor once school age is reached. Children have been found to do best when learning is supported at home, and when teachers and parents/guardians help students work toward commonly understood objectives. Some families are better positioned to participate in the education of their child(ren) than others, be it as a result of economic circumstances, education attainment levels, or other contextual differences. In many cases, COVID-19 ignored many of the underpinnings of the home/school partnership, oftentimes shifting the primary locus of responsibility for education from school back to the home. Opportunities for communication and collaboration between parents/guardians and teachers became strained, mediated as they were for the most part through online appointments as opposed to face-to-face and informal interactions. Those families without the skills and resources to navigate their child's education with reduced teacher interaction inevitably suffered, and the maintenance of home/school partnerships was reported only minimally in the literature as being a priority during the remote learning stage due to COVID-19. For example, in some cases, teachers became resourceful and connected regularly, or at least frequently, with parents/guardians through phone calls which proved to be more accessible for some families due to no, or minimal, internet access. Moreover, when discussing a recent study, [Sharma and May \(2020\)](#) contended that some education support staff described how they would phone learners prior to online lessons to discuss learning goals, in addition to phone or email contact following lessons to provide any required support.

Likewise, while the provision of adequate resources is an oft-cited principle of inclusive education, and an issue most commonly identified by teachers, the school closures helped demonstrate that in some school systems the students who were impacted the most by resource changes during a time of disruption in schools were those living with disabilities. The case of Alberta, Canada provides a salient example of that. As discussed earlier in this chapter, the Government of Alberta cut \$128 million from support services, leaving students without support from teacher assistants and additional substitute teachers at a time when they likely needed more, not less, support. While it is right that teachers be viewed as the provider of education to all students, including those with disabilities, Alberta teachers were themselves expected to adapt to a sudden and profound change in their pedagogy as they moved rapidly from in-person to online delivery. The reduction of support to these teachers left many students with disabilities struggling to engage and genuinely and actively participate in their education. Conversely, and as previously noted in this chapter, Australia made decisions on the opposite end of the spectrum when it came to the roles and responsibilities of teacher assistants. Teacher assistants in Australia maintained a solid position in the remote learning environment and were key stakeholders in learner support (e.g., working with learners in online breakout rooms).

Moreover, school closures due to COVID-19, in many ways, provided all students with additional barriers to education. An over-reliance on technology meant that where delivery switched quickly from in-person to online instruction, those who had adequate technology at home and a suitable study space faced fewer issues associated with access than those who did not. However, the additional barriers presented by online learning compounded barriers to learning already being faced by many students with disabilities. Learning, by and large, became mediated by audio and visual modalities through a computer. Those with visual impairments, those who are deaf or have hearing impairments, and those who have difficulty interacting through a computer for other reasons, were found to be left behind. The reduced provision of human resources to facilitate learning resulted in learning opportunities for students with disabilities that were uneven at best, and non-existent at worst. Moreover, while most teachers were aware to varying degrees that online pedagogy is very different from in-person pedagogy, few had taught in an online environment, or if they had it was often supplemental to in-person classes. Suddenly, with little notice and almost no support, they were expected to change modalities and continue to offer quality learning experiences in an online format of which many had minimal knowledge. This was difficult for those teaching very young children, and those others who had students who required additional support and assistance. Teachers, for the most part, were just expected to do their best with little thought being given to the provision of expertise. In some regions, subject areas, such as physical education, were abandoned and teachers were re-assigned to subject areas they may

have been largely unfamiliar with. For all the talk of having expert teachers in classrooms, this often seemed less important than simply getting through the day during the COVID-19 pandemic. Again, aside from the barriers, throughout the remote learning stage, some educators placed a large focus on reaching out to students and families to assist with technological-related issues and found ways to communicate relevant information through other means (e.g., phone calls).

If schools only existed for the purposes of learning academic content it would be relatively easy to argue that there are other more efficient ways of accomplishing this, and that they are not necessary. Schools, however, also serve a number of purposes, and one of these purposes is the development of social and emotional maturity, typically through communication and friendships. For many learners, school is a primary source of social interaction with their peers, especially in rural areas where due to geography social interactions outside of school are sometimes more difficult to engage in. The COVID-19 pandemic helped demonstrate that the social and emotional development of learners is not a high priority for school systems. While academic classes were scheduled online, there is scant evidence that much was done to maintain social relationships between learners through the facilitation of unstructured settings such as children experience during recess and other breaks in the school day. Educators, perhaps feeling overwhelmed and out of their depth, tended to focus on “the basics” of delivering academic instruction, with social and emotional development very much taking a back seat—and such a focus was set out explicitly by various governmental departments (e.g., Alberta Education). That said, there were some effective measures taken to help build and/or maintain peer relationships during remote learning such as scheduling homework-like assignments for students to check in with peers. This strategy led to profound results for learners staying in touch with classmates while helping to enhance social and emotional development.

What we can learn from COVID-19

Our focus now turns to research question 2, *What can we learn from this current situation about how best we can address inclusion and equity in schools in the future?* As we continue to navigate our way through this COVID-19 state, what has become apparent from this work is that specific principles of inclusive practice have received minimal, if any, attention from various levels extending from governmental-to classroom-level decisions all the way to the other side of the spectrum where educators became quite resourceful in helping to reach all students via remote learning. In fact, according to [Sharma and May \(2020\)](#), in response to COVID-19-related challenges, many educators have rapidly altered their practices and created innovative approaches to ensure learning for all. Throughout this study, there have been some clear messages related to moving forward toward more inclusive education. We would like to offer the following as a step forward for schools globally.

- *Create strong home/school partnerships.* School communities must continue to explore and discover ways to establish quality, deep-rooted relationships with families to ensure there is a true understanding of learner needs from both the school and family perspective. It is of the utmost importance that educators continue to discover ways to ensure effective communication and understanding is focused upon to promote learning for all.
- *Develop a deeper understanding of teacher assistant roles.* When it has been perceived (and even stated) that “teacher assistants now will not be working” during the remote learning stage, it becomes much clearer as to the overall perception toward the roles teacher assistants fulfill for student learning. The critical importance of teacher assistants must be understood from the perspective of educators at the school levels, but also decision-makers at the government level. Laying off teacher assistants in the midst of a pandemic seemed to be quite the opposite of demonstrating an understanding of what teacher assistants’ roles are in schools. However, some schools demonstrated a great deal of knowledge about the importance of teacher assistants (e.g., Australia schools) where teacher assistants played an integral role in student learning throughout the remote learning stage. We note that developing a more thorough understanding of teacher assistant roles is a necessity for all key educational stakeholders.
- *Build and/or maintain peer relations.* Developing ways for learners to build and/or maintain strong peer relations with classmates is a vital piece of the learning pie for all. Although there was much shared throughout the literature about lack of communication among classmates, there were also several terrific ideas that teachers carried out during the remote learning stage that included team-building within the online learning environment. For example, affording students with opportunities to reach out to each other during regular check-ins seemed to help enhance peer relations for students, including students with disabilities who in many cases were found to be quite excluded when practices such as this were not carried out. We contend that the building and/or maintaining of peer relations will lead directly to higher levels of social and emotional wellness for all learners.

Conclusion

In this chapter, we argue that school closures due to COVID-19 have had a significant impact on student learning, and in particular, students with disabilities. Although much can be learned from how school systems reacted to the COVID-19 state by closing schools and turning the in-class learning environment into an online delivery model where students were asked to stay home. At first glance, for those with adequate home support (e.g., family) and technology (e.g., home computer, internet access), this may have seemed to be a seamless, if not rewarding in some ways, request. However, on the flip side, this could not be further from the truth. For learners without family support during the day (e.g., parents are essential workers) and without adequate technology (e.g., no home

computer, no internet access), this request had a negative impact on their learning. In some cases, governments, school systems, and front-line teachers became very resourceful and worked to enhance student learning for all during the remote learning stage. However, evidently, there were also cases where students were left to their own devices for learning such as having limited home/school interaction, losing access to teacher assistant support, and having minimal, in any, communication with peers.

Overall, we believe COVID-19 has played a major role in shedding light on issues related to the principles of inclusive education in schools. In fact, we have concluded that COVID-19 has put a spotlight on a perfect storm. With lack of teacher readiness to help all learners during remote learning combined with fewer resources, and difficulties in communication with families due to technology issues, the remote learning delivery model exposed many of the commonly used nice statements the educational landscape employs as being false in practice.

As we head into the post-COVID-19 world, we are hopeful that major gains can be observed in the areas that became focal points in this chapter to help reach all learners, specifically, students with disabilities. First, a place to begin when it comes to teaching students with disabilities is to ensure policy makers obtain a clear measure of the situation when it comes to actual numbers of students with disabilities in schools. According to UNESCO (2020c), when considering a chronic lack of quality data on students left behind, almost half of low- and middle-income countries do not collect enough education data about students with disabilities. Although household surveys are critical for obtaining education data related to individual characteristics, 41% of countries—representing 13% of the world's population—did not conduct surveys or disseminate data from such surveys, leaving the world with inadequate information on such a vital piece of the educational picture (UNESCO, 2020c). That said, when considering the significant number of students with disabilities, it is hoped that a deeper level of attention is given to home/school partnerships, teacher assistant roles, and peer relations in the learning environment.

For now, although COVID-19 has played a role in increasing the educational divide for many people across the world (Sharma et al., 2020), we can use the information obtained from this study to help guide governments, school systems, teachers, teacher assistants, and families in developing ways to enhance learning for all, and in particular, learning for students with disabilities. And, in the end, if we can help school communities become more aware of and willing to employ the principles for inclusive education discussed throughout this chapter, we will surely see more quality inclusive education worldwide.

Introduction

It is widely accepted in policy dialogue globally that the case for investing in education in Low- and Middle-Income Countries (LMICs) is strong. As UNICEF states *“Investing in education isn’t just the right thing to do, it’s smart economics”* (Brandt, 2015).

Within the broad policy dialogue on education, the promise of tertiary education is three-fold. Firstly, it is argued that tertiary education contributes to human development, improving young people’s prospects later in life, including the ability to actualize capacities and capabilities to be both a holistically developed human and to build knowledge and skills for decent work and other activities that derive pleasure and fulfilment (Sypnowich, 2018). Secondly, it is argued that increased participation in tertiary education at the national level may lead to national development (McCowan and Schendel, 2016), stimulating economic growth and strengthening crucial public services. Thirdly, it is argued that tertiary education contributes to social cohesion, whereby individuals enrolled in tertiary education can experience social mobility (Mehrotra, 2005).

These rationales for investments in tertiary education in low- and middle-income countries are further supported by the increasing demand for tertiary education, *“fueled by the twin pressures of a burgeoning youth population and an improvement in secondary school completion rates ...”* (McCowan and Schendel, 2016, p. 2). Increasingly tertiary education participation is gaining space within national education plans in LMICs due to national aspirations to realize the promise of tertiary education’s contribution to the public good. The national aspiration for tertiary education is articulated in terms of increased productivity and prosperity by preparing graduates for occupations, increased innovation in industry, the creation and distribution of knowledge, reducing social inequalities, increasing the preparedness of citizens for democratic decision-making and to advance free expression (Marginson, 2016).

However, the three promises of tertiary education do not always sit comfortably together. The tension between Nussbaum’s (1999) and Sen’s (2000) seminal work on capabilities as development and traditional approaches that focus on economic growth as development is fundamentally evident in the promises of tertiary education in LMICs.

Within this chapter, we review the multiple recent shifts in the tertiary education landscape and reflect on the implications of COVID-19 for the sector. We then consider the treble promises of tertiary education in the cases of three countries: Ethiopia, India and Peru. Within each of these cases, we review the realization of the promises related to education for all at the primary and secondary levels, we outline challenges to delivering tertiary education during the pandemic and review funding and market trends within the sector. Finally, we explore some of the risks that accompany the processes of expanding access to tertiary education, and how these risks may undermine delivering on tertiary education’s triple promise.

The multiple recent shifts in the tertiary education landscape

The policy logic of investments in the tertiary sector are nested in conceptualisations of tertiary education’s transformative power to improve social mobility and enact change in society. As Heyneman et al. (2007) state: *“That higher education can play an important role in promoting understanding between social groups and building a sense of unity in diverse societies has long appealed to educators and policy-makers alike.”* However, while education is often held up as a mechanism able to challenge and redress inequality in society, there is

a strong sociological tradition arguing that university and school structures reproduce social inequalities and collude to exclude certain students (both within and from education) (Outhred, 2012). As Sellar (2015, p. 112) points out, despite the promise of the relationship between education, economic growth and social mobility, this promise can become an “opportunity trap” (Following Brown, 2003) for many. This is due to global changes in education, increasing competition within job markets and changes in the modes of production in labor markets themselves (Brown, 2003).

Perhaps more than any other sector, tertiary education reflects the complexities of the human development, economic growth and social mobility relationship. As Peters (2016) highlights, it was around forty years ago that Jean-Francois Lyotard predicted the end of the “modern university” based on Enlightenment principles and a push toward tertiary institutions increasingly serving economic needs. Indeed, the role and function of the university sector has undergone significant changes over the last four decades (Blackmore et al., 2010). Post-war western universities are increasingly corporate and play the roles of multinational businesses in service of a knowledge economy (Peters, 2016).

In addition, private tertiary institutions will soon outnumber public tertiary institutions across the continent of Africa (QS, 2015), and in many countries this has already taken place.¹ Many Asian countries have privatized tertiary education in some way (Varghese, 2015). For example, in Indonesia and Singapore public universities are legal entities able to introduce cost-recovery measures, and Lao PDR and Cambodia have introduced fees. In Vietnam a share of funds to the tertiary sector comes from cost recovery through student fees, though public funding continues as the major source of funding (Varghese, 2015). In Latin America, the private sector enrolls a significant percentage of students, and in the cases of Chile and Brazil, the large majority (Reisberg and Altbach, 2018).

Therefore, recent shifts in the tertiary education landscape point to the promise of human development and human capabilities as increasingly subservient to the promise of economic growth. The promise of social mobility and increases in social cohesion also remains notional. Prior to the pandemic trends in tertiary education systems in LMICs indicate that inequalities are growing, rather than decreasing (McCowan and Schendel, 2016). Ilie and Rose identify crucial inequalities in relation to poverty and gender across a sample of 35 LMICs (Ilie and Rose, 2016). They argue that, “... expansion in access to higher education may predominantly benefit the rich, unless measures are taken to tackle inequalities” (Ilie and Rose, 2016, p. 435).

Challenges to delivering tertiary education during the pandemic

The question of how (and under what conditions) education can build human capacity, support inclusive growth and improve social cohesion is now further complicated by the global COVID-19 pandemic. Early in the pandemic (as of April 8, 2020) tertiary education institutions were closed in 175 countries and over 220 million post-secondary students (13% of the total number of students affected by education closures globally) had their studies significantly disrupted due to the global pandemic (World Bank, 2020b). More recently (as of October 28, 2021) fourteen countries have country-wide school and university closures and approximately 55 million learners are affected by these closures (UNESCO, 2020). Few education systems globally were prepared to respond to such disruption and as such, policymakers, education managers, faculty and students themselves have been ill-equipped to continue learning in the face of physical institutional closures.

In March 2020 the predictions were that “higher education can expect at least 12 months of ‘abnormal conditions’ from the COVID-19 pandemic – with at least five years before global student mobility recovers” (Marginson, 2020). Marginson also predicted South Asia and Sub-Saharan Africa will suffer the most from the impact of COVID-19 as student movement would likely be slower and that their recovery would likely take longer.

Pivoting to online delivery has been the most immediate response to closures (World Bank, 2020b), however the challenges of infrastructure, connectivity, access to devices (for faculty and students) and educators’ limited capacities to shift their pedagogical practice to online learning are significant. These challenges are compounded by issues of equitable access for already marginalized groups, along the lines of gender, rurality, class, disability and caste. In addition to limited access to the internet and devices to engage in online learning, the closure of schools and early learning centers has increased the domestic and reproductive burden on women during the crisis, exacerbating pre-existing inequalities.

The mid to long-term outlook for both individuals and the sector, paints a picture of a sector unlikely to simply recover from these challenges and continue with business as usual. Financing for tertiary education has dramatically decreased in both public and private institutions to such an extent that the landscape for tertiary education is likely to shift permanently, and the sustainability of the sector is at risk in many regions. The early indications are that these challenges are not distributed equally between countries. As of 2021 LMICs are more likely to report a reduction in financing for tertiary education than high-income countries (UNESCO, 2021a).

Not only are governments in LMICs unlikely to be able to provide stimulus packages to support the sector, many national budgets are reallocating education budgets toward the health emergency during the pandemic (Salmi et al., 2020). In addition, reallocation of tertiary budgets to the primary and secondary sub-sectors may take place in many countries. Private institutions that are fully dependent on tuition fees may not survive the pandemic. LMICs are also more likely to have reported greater reductions in student enrollment in 2021, presenting a particular challenge for private universities, or systems with capitation-based funding (UNESCO, 2021a).

¹For example, in South Africa the ratio of private to public tertiary institutions is 4:1 and in Ghana, it is 7:1.

Fig. 1 Tertiary enrollment rates in Ethiopia, India, Peru, and the world (Our World In Data, 2021).

Overall, the pandemic highlights the fragility of the tertiary sector, particularly in LMICs, and the risks to sustainability and inclusion when delivering on the promise of human capital development is pursued at the cost of the other promises of tertiary education.

The cases of Ethiopia, India and Peru

In order to consider the risks, sustainability and inclusion implications of delivering on the promises of tertiary education, we review three country contexts: Peru, India and Ethiopia. Collectively, these countries represent a mix of early tertiary education take up contexts (Ethiopia), recent rapid uptake contexts (India) and a country soon approaching the massification of tertiary education (Peru) (see Fig. 1). The role of tertiary education in the vision for national development also differs in each country.

In addition, each of the three countries have had diverse experiences with the prevalence and likely impacts of COVID-19. Peru is among the top 10 countries with the most COVID-19 related deaths, and by many reports the highest deaths per capita globally (as of December 2021). Education institutions partially re-opened in September 2021, with 34 weeks of full closures and 36 weeks of partial closures since the beginning of the pandemic. India has recorded a high number of infections and COVID deaths. Education institutions have, as in Peru, been fully or partially closed since the beginning of the pandemic. With distance learning being the norm, the divide between students from privileged and less privileged backgrounds is growing as access to technology becomes integral to accessing education during closures. In Ethiopia, COVID cases and deaths (as of December 2021) are significantly lower than many countries. School closures have been shorter than in either Peru or India, with schools having been fully closed for 22 weeks, and partially closed for 9 weeks. However, as in India, school closures are likely to increase the inequalities between the advantaged and disadvantaged students due to unequal access to technology and differing domestic and reproductive burdens.

Ethiopia

In Ethiopia, tertiary education policies have been central to the vision for economic growth, poverty reduction and sustainable development since 1991. The Ethiopia Education Development Roadmap outlines the need to improve gross education enrollment in tertiary education in order to reach lower-middle income status by 2025 (with the target set at 25%). The latest figures indicate gross enrollment (2014) is at 8.1% (UNESCO, 2021b) and has remained approximately the same since 2010. While since the early 1990s, efforts have been made and the representation of women has increased, high attrition rates remain and enrollment ratios of students from less affluent regions stands at just 2.5% and the wealthiest households account for 87% of TVET and 82% of tertiary education enrolments (UNESCO, 2021b).

Ethiopia's private tertiary education sector accounted for around 17% of national tertiary education enrollment. This private sector has experienced pronounced effects of COVID-19, due to the heavy reliance on student tuition and fees. There have been calls to provide greater government support to private institutions through tax exemptions, long-term loans, rent waivers and direct

financial support (Tamrat, 2021). Some observers have concluded that “... unless a substantial intervention is made in time the [private] sector which boasts the largest number of students in Africa will be significantly weakened” (Tamrat, 2021).

Ouedraogo et al. (2021) analysis of intergenerational mobility in education attainment and occupational status indicators in Africa, finds that upward social mobility² in Ethiopia is most clearly observed at the primary education level (at 15% likelihood). However, downwards social mobility at the primary education level is higher at 28% likelihood.³

The likelihood of a child completing tertiary education, when adopted or born to parents who have completed secondary education in Ethiopia is extremely low (0.1%) and the chances of a child not completing tertiary education, when adopted or born to parents who did complete tertiary education is 96%. This indicates that lower mobility is a more likely outcome even among the most educated families (Ouedraogo et al., 2021).

Upwards intergenerational mobility in occupation status in Ethiopia is extremely low, with the likelihood of a child, born or adopted from parents working in the agriculture sector, working in blue- or white-collar occupations, at only 3%. This is even lower for males and those living in rural areas (Ouedraogo et al., 2021). Downward intergenerational mobility measured by occupation status (the likelihood of a child working in agriculture, born or adopted to parents who worked in blue- or white-collar occupations) is more likely than upward mobility (28%) and even higher for males and those in rural settings (36 and 57% respectively) (Ouedraogo et al., 2021).

These intergenerational trends of limited educational and occupational upward mobility and considerably high downward educational and occupational trends speak to the “opportunity trap” (Brown, 2003) whereby global changes in education have increased upwards mobility at the primary school level, yet tertiary and occupational intergenerational mobility are hindered by changes in the modes of production in labor markets themselves.

While intergenerational mobility at the primary school level has taken place in Ethiopia, even before COVID-19 disadvantaged children across Ethiopia and the rest of sub-Saharan Africa were unlikely to complete their primary education (Yorke and Rose, 2020). COVID-19 will likely increase drop out for the poorest children (Yorke and Rose, 2020).

India

In India’s 2020 National Education Policy, tertiary education is framed as being key for individual, societal and economic development (Government of India, 2020). The most recent figures (2017) for gross enrollment at the tertiary level is approximately 27% (UNESCO, 2021b). From an equity perspective, regional inequalities in the distribution of tertiary education facilities and regional market forces have resulted in high regional disparities in tertiary participation rates. Caste remains a strong barrier to entry and Muslims lag behind all other religious groups in terms of enrollment (Tilak and Choudhury, 2018). There are some improvements in participation rates of students from families belonging to the poorest group in the lowest economic quintile (around 4% in 2007, and 9.9% in 2014).

While different studies have taken different approaches to measuring inter-generational education mobility, the findings are consistently mixed. There is evidence that education mobility has improved over time in India (Azam and Bhatt, 2012; Asher et al., 2021; Kundu and Sen, 2021). This general trend however masks other important equity considerations. For example, Asher et al. (2021) found that overall improvements in education mobility for scheduled tribes and castes masked a worsening of mobility for children from Muslim families (Asher et al., 2021). It was also found that increasing levels of parental education closed the attainment gap for girls (Emran et al., 2020). While the impact of family background on educational attainment may be decreasing overall, this is not true for all marginalized groups.

Around two-thirds of India’s tertiary education students are enrolled in private institutions. Combined with significant increases in the annual average household expenditure on tertiary education between 2007 and 2014 (Pushkar, 2021), rising unemployment and poverty rates in India due to COVID-19 are likely to undo the previous gains of access to tertiary education for the poorest.

The impact of COVID-19 on the public sector is both financial and human. For example, the University of Delhi has lost 15 teachers to COVID-19 and Aligarh Muslim University has lost 16 current and 18 retired faculty members to the virus (Pushkar, 2021). With a history of neglect, poor regulation and inadequate financial support, India’s public universities may never recover from the effects of the pandemic (Pushkar, 2021).

Household expenditure on tertiary education is highest for the students enrolled in private -unaided institutions and is lowest for public institutions, with private-unaided household expenditure 3.5 times higher than public institutions (Tilak and Choudhury, 2018). Rising income inequality in India has increased the challenges of access to quality tertiary education for those from the poorest households and the returns to education have increased during this time (Tilak and Choudhury, 2018).

²Defined by Ouedraogo and Syrichas as the likelihood of a child adopted or born to parents who have not completed primary education, completing primary education themselves.

³Defined by Ouedraogo and Syrichas as the likelihood of a child adopted or born to parents have not completed primary education, not completing primary education themselves.

Peru

The National Education Project in Peru supports the “Higher Education Quality Improvement Project”, which has adopted a strategy to increase the quality and relevance of tertiary education in Peru. The Peruvian national development plan’s (Gobierno del Perú, 2019) objectives are captured in the plan’s title “National Plan Competitiveness and Productivity”. Objective two is of the plan is to “strengthen human capital” which includes a sub-objective on the strengthening of access to and quality of tertiary education.

Most recent figures (2017) have gross enrollment in tertiary education at approximately 70%, with higher female enrollment and large differences between urban and rural (80.8 vs. 30.6% respectively) and the richest and poorest students (142 and 31% respectively) (UNESCO, 2021b).

Education mobility in absolute terms has increased dramatically in the last fifty years, driven by an expansion of availability in basic education in the 1970s (Gaentzsch and Román, 2018). This increase in absolute mobility,⁴ however, masks a lack of progress in relative mobility.⁵ The likelihood of a child whose parents have no education achieving tertiary education is 0.06 (Gaentzsch and Román, 2018). In another study it was found that 65% of those with high parental levels of education are likely to achieve the same, with this figure dropping to below 15% for those with low parental levels of income (Neidhöfer et al., 2018). This is among the highest levels of inter-generational educational persistence in Latin America, though it is improving over time, with persistence rising at higher levels of education, and falling for lower levels of education (Neidhöfer et al., 2018). While access to tertiary education has increased, lifetime returns on tertiary education are heavily influenced by the quality of institutions, which is in turn influenced by socio-economic background (Sánchez et al., 2021).

As with many countries approaching the massification of tertiary education, observed gaps in enrollment between the richest and the poorest are often explained in terms of aspirations. Castro et al. (2016) state that the observed gap between the participation of rich and poor households is not only explained by short-term credit constraints, but also by poor cognitive skills and family backgrounds affecting “*tastes, aptitudes and aspirations for formal education*” (2016). Policy discourse regarding aspirations has come to the fore during the tertiary education massification projects of high-income countries. Success is at times understood to be a matter of choice, discounting the structural issues that plague education systems and societies (Bowers-Brown et al., 2019).

Massification of tertiary education in Peru has been heavily supported by an expansion of private sector involvement in education. This was initially driven by a 1996 reform of the education sector, which opened up the sector to private investment, and provided tax incentives for investors (Zeta, 2021). The result of this is that 8 in 10 tertiary education students are currently studying in private institutions (Benites, 2021). This liberalization of private investment in education means that in terms of the proportion of GDP spent on education, household expenditure outweighs government investment, with tertiary education accounting for the largest share at 44% of household education expenditures (Acerenza and Gandelman, 2017). Reflections on the post-covid landscape in Peru have predicted that it will be these private institutions, and particularly low-cost private institutions which will be most adversely affected by the crisis (Benites, 2021).

Looking to the future

Looking at these three case studies we see a diversity of historical trajectories, as well as current social and economic standing. We also see some common characteristics of countries in the process of massifying tertiary education. The tertiary education landscape in all three can be characterized as:

1. Being driven by a policy environment focused on the massification of tertiary education for the purpose of achieving greater economic growth.
2. Having low levels of education mobility, particularly for economically or socially marginalized groups.
3. Being increasingly reliant on the private sector to support the massification of tertiary education.

It is a crucial moment in time for policy makers and decision-makers to understand how education systems (at all levels) can support inclusive growth in tertiary education, without widening inequality. Policies aimed at narrowing gender gaps and widening opportunities for decent work through education during and after COVID will be crucial to delivering on the promises of tertiary education in future years.

Considering the common facets of systems working toward the massification of tertiary education outlined above, we suggest three “traps” that lie in wait for policy makers. They are traps in the sense that if they are not carefully considered they will undermine and weaken the connection between the expansion of tertiary education and its triple promise to improve individual capabilities, economic growth and social cohesion. They are:

- (1) the risks inherent to the rapid expansion of access to tertiary education (the massification trap);
- (2) the risks inherent in not putting equity at the forefront of planning (the opportunity trap); and
- (3) the risks associated with the role of international student mobility (the internationalization trap).

⁴Defined as the change in proportion of people accessing education over generations.

⁵Defined as the determination of education outcomes by parental level of education.

The massification trap

The massification of tertiary education seems to be an inevitable follow on from the massification of basic and secondary education. This is evidenced by the Sustainable Development Goal (SDG) target 4.3, which aims to, "... by 2030, ensure equal access for all women and men to affordable and quality technical, vocational and tertiary education, including university" (United Nations, 2015). This shift has begun in LMICs and is visible in the three case studies presented here. As the world of work becomes both more globalized and more technologically demanding, citizens will look to their governments to provide them with the kind of tertiary education that has become a global norm (Rizvi, 2018).

Lessons on massification are evident in both the experiences of massification of tertiary education in high-income countries, as well as the experiences of massification of basic education in LMICs.

Lesson from high-income countries

Massification of tertiary education in high-income countries has generally taken place in the second half of the twentieth century. This massification has led to a rapid expansion of the number of people taking part in various forms of tertiary education. Obvious benefits in terms of individual capabilities, workforce capacity, and social cohesion appear within the massification narrative. However, several trends undermine this narrative.

Firstly, there has been a trend toward *managerialism*. Academic boards in Australia and in Britain in the 1960s were predominantly constituted by professors, whereas recent shifts toward tertiary education as a consumable has led to a growth in the proportion of board members who are senior managers or executives (Blackmore et al., 2010). While this is inevitable in the context of hugely increased student numbers, it presents a challenge to the promises of tertiary education. It has led to an increased managerial burden and scrutiny on lecturers, the increased standardization of teaching practices, and the increased need to align with external demands rather than the developmental needs of students (Fisher, 2006; Carpentier, 2018; Evans et al., 2021). It is argued that this has led to a perceived change in the *character* of the university toward an organ of the economy rather than of the holistic development of young people (Fisher, 2006). This suggests that the process of massification in high-income countries has led to the prioritization of equipping the workforce over the individual capabilities of the student.

The second observable trend leading from the massification of tertiary education in high-income countries is the process of *differentiation* of institutions. A common factor visible in countries which have expanded access to tertiary education is the emergence of a range of different kinds of tertiary education institutions. The creation of an explicitly or implicitly tiered system of tertiary education is impactful in widening participation rapidly, but ultimately entrenches existing inequalities (Carpentier, 2018). For example, in the United Kingdom, where significant emphasis is placed on marketing to potential students, it has become increasingly difficult for students to interpret this differentiation, placing increased emphasis on a need for students to *manage* their own educational journey (Knight, 2019), an ability linked to individual cultural and social capital.

Lessons from the massification of basic education

The implementation of the Millennium Development Goals (MDGs) on education led to a rapid expansion of access to basic education globally with the proportion of out of school children at primary school ages halving between 1996 and 2015 (World Bank, 2020a). However, it has since been recognized that this has not translated to improved learning outcomes with 6 of 10 children and adolescents not meeting minimum proficiency standards in reading and mathematics (UIS, 2018).

Low quality and irrelevant education threaten delivering on the promise of developing human capital toward national economies and developing the capacities of individuals. Poor quality education can fail to develop the capacities of children and young people who spend much of their time in learning institutions yet are not learning. Additionally, too many students who are *successful in school* are not learning the skills and knowledge aligned with current and future employment needs to contribute to national economic growth (Allen et al., 2016). Both the real and perceived benefits of schooling are affected by gender, age and wealth (Rollleston, 2014, p. 135) and the extent to which individuals and schools can convert endowments into learning and learning into academic and workforce outcomes differs by individual background factors (Outhred and Lipcan, 2016).

The challenge of balancing the rapid expansion of access, with a need to deliver quality outcomes is also likely to be seen in the massification of tertiary education. This will particularly be true where the expansion of access is done rapidly, without opportunities for a gradual build-up of institutional capacity which would allow for the delivery of quality education (Rizvi, 2018).

The opportunity trap

It is widely assumed that increased access to quality education leads to greater social mobility. Discussion of social mobility is primarily interested in the extent to which an individual's, or group's opportunities in life are defined by their social origins (Müller and Pollak, 2015). In discussing the promise of tertiary education, this means focusing on the extent to which participation in tertiary education weakens the link between social origin and lifetime opportunity.

There is ample evidence from the Organization of Economic Cooperation and Development (OECD) on the interactions between social mobility and educational outcomes. Unsurprisingly this link is bi-directional and complicated. The level of social

mobility in a country influences equity in access to tertiary education, and participation in tertiary education influences social mobility. The OECD's conclusions (OECD, 2018) on the links between social mobility and education are:

1. Income inequality is the key factor in limiting social mobility
2. Income inequality is also shown to limit access to tertiary education for under-privileged students
3. In unequal societies, both the perceived and actual lifetime returns on tertiary education are lower for under-privileged students.

The evidence concludes that in societies where education outcomes are more determined by family background than they are by student aptitude, the expansion of tertiary education serves only to reinforce inequalities (OECD, 2018). The implications of this are that where societies are unequal, investment in tertiary education, without a clear equity agenda and strategy, will do little for social cohesion. Its impacts on individual capabilities and workforce capacity will skew toward the privileged (Ilie and Rose, 2016; McCowan and Schendel, 2016).

Evidence from high-income countries highlights the importance of how tertiary education is financed. Looking across OECD countries there is a strong correlation between the funding model for tertiary education, and inter-generational educational mobility. Countries with universal access, either through central funding, or a centralized loan system, have a lower correlation between socio-economic background and access to education (OECD, 2010). This suggests that investment in tertiary education does not guarantee equity in opportunity. If tertiary education does not work to increase social mobility it is unlikely to fulfill its promise of increased social cohesion, and its benefits in terms of individual capabilities and workforce capacity will be limited to those with inherent privilege. This equity dimension is particularly important in cases where per-student investments in tertiary education significantly outweigh per-student investments in primary and secondary education. If access to, and benefits from, tertiary education are skewed toward those from privileged backgrounds, these investments are particularly unequitable.

The globalization traps

In our three case study countries, the globalization of tertiary education has taken place. This can be seen globally, with international student mobility doubling between 2007 and 2019 (OECD, 2021). The number of students from low and middle-income countries studying abroad is relatively small, for example the outward mobility ratio (defined as outwardly mobile students as a percentage of total tertiary students in a country) for India is 1.3%, and for Peru is 1.7% (UNESCO Institute of Statistics, 2021). For receiving countries however, the internationalization of tertiary education is very significant. For example, the inward mobility rate in the United Kingdom is 18.7%, and for Australia is 28.4% (UNESCO Institute of Statistics, 2021).

There is an ongoing debate regarding the positive and negative impacts of the globalization of tertiary education. From the inwardly mobile (host country) perspective, the benefits are framed both in terms of economic benefits, and human capital benefits. As an example of the former, the export of tertiary education services was worth GBP 16 billion to the economy of the United Kingdom in 2019 (Department for Education, 2020). This trend has been heavily driven by the marketization of the domestic tertiary education market, bringing financial benefits for attracting more students, particularly in cases where international students are required to pay higher fees than domestic students. Human capital perspectives are driven by an increasing demand for highly educated young people, and the ability of high-ranking universities to attract the best students globally (Knerer et al., 2012). This builds on the promise of tertiary education to support the development of a modern and competitive workforce.

From the outwardly mobile perspective, there is evidence that when students return to their home country, they are able to bring both new perspectives and knowledge, which benefit both the development of their individual capabilities, as well as the capacity of the workforce in that country (Knerer et al., 2012; Chan et al., 2016; Campos and Rocha, 2021). This is tempered by the threat of "brain drain" in LMICs, which can deprive universities in countries of origin of promising students, financial revenue, as well as prestige, as they are implicitly considered as offering an inferior product to a foreign education (Mlambo et al., 2020). The scale of brain drain is less clear. While there is evidence that students who study abroad are more likely to work abroad in the period after studying (Oosterbeek and Webbink, 2011) there is no evidence to account for how many students will permanently relocate. There is also a theoretical position of ideal outward mobility, in which the education maximizing effect of the possibility of studying abroad outweighs the loss of educated population through brain drain (Docquier, 2014). While this makes a strong case for international student mobility being a potential positive influence on the individual capabilities and economic development of countries of origin, the literature does not address completely the social cohesion dimension, and the issue of the perception of value of domestic tertiary education as set out by Mlambo et al. (2020).

Tertiary student flows from LMICs to, often the colonizing nations of Europe, reflect both the historical and present-day role of tertiary education in stratifying humans. Historically there are three main waves of colonial university establishment, from:

- (1) The early "outposts" established by the Spanish in the New World during the sixteenth century;
- (2) The next 300 years of progressive consolidation of universities in the New World; and
- (3) the British established higher learning institutions in African colonies after World War II, as part of the policy of indirect rule (Peters, 2019).

Following independence, universities in formerly colonized nations have faced multiple challenges (many outlined in this entry), including ridding themselves of the epistemological and ontological legacies of colonialism, that perceives them and their people as

the recipients of world knowledge (“the periphery”), rather than creators of it (the center) (following [Peters, 2019](#)). The challenge of decolonizing is certainly one of a multitude of challenges that impact upon both the real and perceived quality of tertiary education available to citizens.

Against this historical backdrop, emerge national elites able to parlay their positions of relative advantage for greater opportunities (perhaps Bauman’s “Tourists” of the human condition in globalization) ([Bauman, 1996](#)). This is undertaken through mobility to tertiary institutions within “the center” countries.

From the perspective of our three promises of tertiary education, the globalization traps are complicated. There are benefits in terms of individual capabilities for studying abroad, both in terms of access to high quality academic education, as well as in the personal and intercultural benefits of studying abroad. In terms of workforce capacity and social cohesion the outcomes are less certain. Finally, the globalization traps risk increasing investments in tertiary institutions within “the center” and decreasing material and human resource to build tertiary education quality in LMICs and decolonize the institutions historically embedded as “periphery” knowledge recipients.

Conclusion

The expansion of access to tertiary education promises support to national development in three ways:

- (1) through the development of individual capability;
- (2) through the promotion of a modern, highly skilled workforce, stimulating economic growth; and
- (3) through the strengthening of national social cohesion, through social mobility.

Based on one or more of these promises many governments in LMICs are pursuing massification of tertiary education, supported by the aims of Sustainable Development Goal 4.

This expansion toward universal access to tertiary education is taking place against a background of a dynamic globalizing tertiary education space. Planning for tertiary education is increasingly being driven by the rapidly changing needs of increasingly technological industries, shifting the kinds of knowledge and skills needed for the workforce. Greater international mobility has placed tertiary education firmly in the realm of a global commodity, with highly ranked universities marketing themselves extensively to prospective students in emerging economies. In these emerging economies, the increased demand for tertiary education is leading to a proliferation of private institutions, and often reduced investments in the public institutions.

All of these trends must now be placed against the context of two years of global disruption caused by the global COVID-19 pandemic. COVID-19 has highlighted the fragility of a sector model built to primarily serve the promise of a modern workforce to promote economic development. Disruption during the pandemic has been both direct and indirect. Direct disruption includes restrictions necessitating a move toward remote instruction, threatening the quality of education for a generation of graduates. Indirect and long-term disruption includes the reduction in international mobility, which has the potential to negatively impact both host and origin countries, and decreased investments in tertiary education, as well as a loss of human capacity. Similarly, private institutions are more likely to suffer from loss of funding through lower student enrollment.

Observing examples from across the three case study countries of Ethiopia, India and Peru commonalities emerge. Expansion of access to tertiary education is prioritized in national policies and a steady move toward the massification of tertiary education is observed. At the same time, we can observe systems with entrenched inequalities in access to tertiary education, and systems in which there is little inter-generational education mobility. Reliance on private institutions means that a large proportion of funding for tertiary education is from household contributions. Therefore, a lack of social mobility becomes both the driving force and consequence of unequal access to tertiary education. Without explicitly addressing inequality within and as a consequence of the system, tertiary education cannot deliver on the promise of improving societal cohesion.

Learning the lessons from previous massification projects, policy makers should not assume that as access to tertiary education expands, the nature of the education changes. The successes of massification at the primary and secondary levels have at times been undermined by a reduction in the quality and relevance of education. Therefore, the ability to translate participation in education to increased individual capacities and meaningful lifelong outcomes (promise one) should not be assumed to be equal for all students. This is also evidenced in the opportunity trap. There is ample evidence from countries which have already massified tertiary education to show that often tertiary education can serve to reinforce social inequalities rather than to reduce them. This is particularly true in countries with pre-existing inequalities, as is true in many low- and middle-income countries. Finally, the globalization traps highlight that alongside the expansion of opportunities for access to tertiary education domestically, there is a trend toward greater international student mobility. The evidence for this is mixed, and there are many reciprocal benefits for both origin and host, should the process be well managed. However, the internationalization of tertiary education is also built on the legacy of colonial approaches to tertiary education, entrenching global hierarchies, and threatening the promise of social cohesion.

The massification of tertiary education is not simple, and the link between expansion of access and delivering on the triple promises of tertiary education is not clear. Policy makers in countries looking toward universal access to tertiary education have an opportunity to learn from countries that have been through the process of massification of education and from their own experiences of expanding basic education. Policy makers should not assume that each of the three promises of tertiary education will be realized as a natural consequence of achieving increased access to tertiary education as the three promises rarely sit comfortably together.

Rather, policy makers should seek to balance and maximize the three promises of tertiary education, especially when navigating a complex and shifting post-COVID global landscape.

Introduction

Trends in education are often focused on methods, such as *Understanding by Design* or ideas, such as the creation of block scheduling in schools, but the people behind these practices hold the key to understanding how knowledge and cultures change. Understanding one's own role in teaching and learning is crucial to promoting sound, equitable practices. This chapter will highlight the origins of teacher education to acknowledge the roots of the profession, and then will highlight the role of reflection and its place in teacher preparation. Finally, autoethnography will be discussed as a method for critical reflection used to undergird a foundation for practice grounded in social justice.

Origins of teacher education

Teaching has existed in various forms from the earliest days of civilization. Knowledge was passed from one generation to the next, for instance through storytelling and folk tales, reflecting traditions and cultures of the community and its people (Amali, 2014). As formalized schooling began to occur in Europe and later in North America, there was no specific training for teachers, but rather those who completed a given level of education or experience were deemed ready to teach. Labaree (2008) notes that the expectation for teacher preparation was that if you took the class, then you could teach the class. In early times, special courses or even apprenticeships were not part of teacher preparation (Labaree, 2008). Instead, teaching was based on the personal experience and knowledge of the person teaching. People were at the center of the teaching process.

As the field evolved, teacher education and its place in the university setting differed across the globe. As early as medieval Europe, teacher education was embedded in a liberal arts curriculum to ensure breadth of knowledge, and the university was seen as the place to award advanced degrees indicating “master” teacher status (Schulman, 1986). Yet in the United States, teacher education in institutions of higher education did not take root until the nineteenth century, and even then it was not at the epicenter of the university (Labaree, 2008). The different forms of teacher education have shifted from general, liberal arts preparation to a more specialized preparation based on the demands of the job, particularly as the professional status of teachers changed. Yet, even with the changes in teacher preparation, people and their experiences remain constant.

According to Labaree (2008), the “common school” model originated in the United States in the 1830s, launching a greater demand for formal teachers. With the increased pressure for teachers also came the need for credentials. Even in the earliest years of formalized teacher education, the issue of standards arose. Yet the idea of performance standards within teacher education broke down into relevance versus rigor in many early programs with the more elite schools opting for rigor over relevance (Labaree, 2008, p. 293). Conversely, critics of teacher education, such as Arthur Levine (2006), label teacher preparation as, “academically weak and professionally irrelevant,” despite the elite labels. Arguments arose that teacher education failed to acknowledge and keep pace with the changing demands of schools. This suggests that teachers were teaching based on what they knew to be true—their own experiences with education, rather than the current educational landscape.

As the field of education continues to evolve, teacher education needs to follow suit in order to meet the demands of the profession. Yet, rather than mirroring the educational trends, often mandated by political appointments, this chapter argues that teacher education needs to be first centered on critical reflection and awareness in order to ensure that pre-service teachers acknowledge their own bias and experience in relation to their practice.

Teachers are products of their own education and experiences, whether positive or negative. Danielson (2009) asserts that pre-service teachers, “developed preconceived ideas of what teaching is through having watched others do it. They may sense what teachers do but have no grasp of why they do it.” Without acknowledgment and deep, critical reflection on these experiences, replication of outdated or ineffective practice will be likely. This is especially true for white, middle to upper class teachers, who teach diverse populations of students. Developing a critical reflective practice is essential for delivering culturally relevant pedagogy and identifying issues of social justice.

Reflective practice in teacher education

Not all reflection is created equal. Dewey (1933) began addressing reflection as a way to face dilemmas and make sound decisions based on the information at hand. In the classroom, this may mean using the information gathered to make instructional decisions. Other researchers supported this (Hargreaves and Fullan, 1992; Lortie, 1975). Yet, as teacher education continues to evolve, reflective practices vary greatly across institutions in type, amount, and regularity. There are important distinctions between reflecting based on an incident or specific practice, and reflection for the purpose of challenging social norms and issues of social justice. Is the purpose of reflection for grade or for lasting change?

Valli (1997) outlines five types of reflection common in teacher education—technical, reflection-in and on-action, deliberative, personalistic, and critical reflection. The first type is considered “technical,” as this kind of reflection pertains to specific instances within the classroom (Minott, 2008, 56). However, this type of reflection can be considered transactional in that the pre-service or practicing teacher is only focused on one specific event or series of actions, for instance a lesson or a unit of study (Zeichner, 1994). This type of reflection has been criticized for allowing the writer to assign blame when lessons do not go as planned. For instance, statements such as, the children were not focused, or it was after lunch and the students were restless. Excuses are provided instead of examining lesson content, accessibility to learning, classroom environment and other factors. Reflection in this case is often done to satisfy a requirement for a class or to earn a grade. This results in surface level thoughts, a recounting of events, and once completed, it is often forgotten with little to no learning involved.

Another type of reflection described by Valli (1997) is reflection-in-action and reflection-on-action. These types of reflection are about the overall teaching practice of the pre-service teacher or practitioner. This can occur before a yearly review with a supervisor or at the end of a teaching term. Minott (2008) states that this type of reflection includes an examination of personal beliefs and values, but without specific means for this to occur, not all educators engage in this practice independently. This closely relates to a third type of reflection—deliberative, as outlined by Valli (1997). In this case, educators or pre-service teachers research and consider competing views, weighing evidence and different viewpoints, then making a decision based on their own situation (Minott, 2008, 56). Yet, while this approach potentially evaluates current research, it does not specifically address a teacher’s own experiences and beliefs in relation to the research and situation at hand. As a teacher approaches and evaluates research, they will already hold preconceived notions based on their own experiences and previous beliefs. There is a real danger of confirmation bias in this approach.

Another common type of reflection seen in teacher preparation programs is referred to as, “personalistic” reflection (Valli, 1997). This draws upon personal reflections on one’s inner voice or thoughts. This is closely related to technical reflection in that it could be about a specific event, but it differs in that it could be much broader in scope. This kind of reflection could be about a teacher’s relationship with a particular group of students or their own views on their role as a classroom teacher in general. While this may be a cathartic exercise for pre-service teachers, it does not facilitate proactive examination of specific beliefs and practices undergirding one’s practice.

Finally, Valli (1997) does acknowledge critical reflection as one of the five types. The goal of this reflective practice is to better understand issues of social justice impacting students and the classroom environment. Yet, without specific instruction and a method for entering into this practice, how do we ensure that pre-service teachers and current practitioners are regularly engaging in this mentally demanding task? Hatton and Smith (1995) criticize Valli’s reflective typology, calling it hierarchical in nature (Minott, 2008, 57). These critics suggest that only some types of reflection, as outlined by Valli, require a more critical perspective—those at the top of the hierarchy. However, it is not the hierarchy that needs to be questioned, but rather the intent and frequency of the various types of reflection and their place within teacher education. Teacher preparation programs need to examine when, how, and why pre-service teachers are engaging in reflection to understand its effectiveness.

Many other researchers (Bright, 1996; Brookfield, 2004; Cranton, 1996; Dewey, 1933, 1938) recognize the importance of critical reflection in teacher education. Shandomo (2010) defines critical reflection as, “... the process by which adults identify the assumptions governing their actions, locate the historical and cultural origins of the assumptions, question the meaning of assumptions, and develop alternative ways of acting” (101). This type of reflection invites a deeper level of examination. It goes beyond looking at specific events such as a lesson, and instead invites an inquiry of one’s own beliefs.

Critical reflection also acknowledges pre-service teachers’ expertise and life experiences. Zeichner (1994) notes, “... reflection also signifies a recognition that the generation of knowledge about good teaching is not exclusive property of colleges, universities, and research and development centers, a recognition that teachers have theories too, that can contribute to a codified knowledge base for teaching” (10). This places ownership on pre-service teachers, as well to draw up their own knowledge base and to consider

how this aligns with what the university is teaching. It begins to build a practice where teachers evaluate knowledge and determine if and how to use it. Materials and programs do not teach children, people do. Acknowledging the expertise, as well as the bias and backgrounds of educators is essential to ensuring sound practices in the classroom.

The five types of reflection defined by Valli (1997) need to be questioned and examined further by educator preparation programs to determine whether and how the different modes of reflection are used. As stated previously, not all reflection is created equal. While there may be a time and a place for different forms of reflection, the foundation needs to be grounded in critical reflection. Without a deeper examination of one's beliefs and values, one's teaching practices are only replications of past practice and experiences.

Critical reflection can take many forms, yet one method offers a way to reflect on both beliefs and experiences, while drawing upon evidence. Autoethnography can be used as a method for critical reflection with pre-service teachers, as a way to examine their own school experiences and their beliefs about learning. The next section of this paper will discuss the merits of autoethnography as a method for critical reflection in teacher education.

Autoethnography as critical reflection

As a method for critical reflection, autoethnography stems from more traditional ethnographic research. In the context of teacher education, this research-based approach has been used to ignite critical reflection from pre-service teachers (Rice, 2019, 2021). The definition used for autoethnographic reflection in these studies stems from the work of Adams et al. (2015). These authors define autoethnography as a specific research method with six related principles (1–2):

1. Uses a researcher's personal experience to describe and critique cultural beliefs, practices, and experiences.
2. Acknowledges and values the researcher's relationships with others.
3. Uses deep and careful self-reflection to name and interrogate the intersections between self and society, particular and general, personal and political.
4. Shows people in the process of understanding and acting on that understanding.
5. Balances rigor while considering emotions, intellectual pursuits, methodological underpinnings, and creative writing.
6. Expresses concern for social justice.

These six principles form a foundation for autoethnographic writing. As a research method and a form of critical reflection, autoethnography is not the simple act of generating a personal narrative, such as with the 'transactional' approach to reflection described in the previous section. Rather, the principles outlined by Adams, Holman Jones, and Ellis acknowledge the experiences, practices, and values of the writer, while interrogating the roots of these things for the purposes of social justice. Similarly, Cunningham and Jones (2005) identify autoethnography as an objective stance on the author's personal beliefs, and a way to interpret specific actions, thoughts, and behaviors specific to teaching. It is an opportunity for pre-service teachers to identify specific personal biases that may influence instruction in the classroom.

In order for pre-service teachers to be effective in their profession, they need to understand the complex diversity present in their classrooms, and how as teachers they personally identify with these ideologies (Starr, 2010). Freire (1973) describes the concept of "conscientization" or becoming aware of one's own self and position in society, and how it creates a space for change within one's reality. Starr (2010) describes it more simply as a "study of space between self and culture to engage the individual in experiences that cultivate an authentic cycle of "action-based reflection" (1–2). Increasingly, teachers do not always represent the cultures and diversity of the students in their classroom, as many teachers are white females. It is necessary for educators to reflect on their own experiences and beliefs in order to acknowledge their potential bias, positionality, and pedagogical decisions.

Several fields, including sociology, education, and Disability Studies, already employ autoethnography as a tool for research (Pitard, 2019; Starr, 2010). Yet, the majority of the research in education has failed to consider the potentially significant role that autoethnography can play in developing reflective practice. Autoethnography is a way for pre-service teachers to recognize and process their beliefs about teaching, through examining their experience as learners. The future teachers unearth their predispositions about teaching and learning, so as to better their classroom instruction. For instance, a pre-service teacher may choose to recount their own experiences with punishment in school (seeing punishment given or receiving it). This could lead to an interesting discovery about the individual's current beliefs about classroom management and student behavior. As an example, if the pre-service teacher experienced punishment frequently as a student and saw the process as unfair, then this could impact how he/she approaches classroom management, specifically punishment in their current classroom. Autoethnography becomes the tool used to unearth who we are and what we believe in order to determine how we arrived in this place.

Another view: a critique of autoethnography

There are scholars who critique autoethnography as personal, self-indulgent writing (Starr, 2010). As a research method, autoethnography is also criticized for lacking rigor and having limited bearing on scholarly writing (Anderson, 2006). However, Starr

(2010) counters this with an important aspect of autoethnography, which is often misunderstood—as a method, it offers the capacity for dialog leading to social change, increased consciousness, and informed participants. In addition, when using autoethnography as critical reflection with pre-service teachers, the emphasis is less on scholarly writing, and more about unearthing long held beliefs and practices.

Traditional research relies on objectivity to remove one's self and bias from the process, and from potentially skewing results. Yet in autoethnography, these lines are blurred by the nature of the method (Cunningham and Jones, 2005). The focus of autoethnography is on one's self, personal experiences, and views. Throughout the process of generating an autoethnography, the participant steps back to interpret these attributes of the work as part of the reflective practice. While complete objectivity is not possible, as the writer is central to the genre, relative objectivity can be achieved with analysis and reflection about the process. The potential benefits of autoethnography as a method for critical reflection, and the activation of social justice, outweigh the concerns expressed by some scholars.

Some researchers in social sciences consider autoethnography contentious (Allen-Collinson and Hockey, 2008). Autoethnography is seen as particular only to one's self, identifying it as overly personal. Critics identify the blurred line between researcher and participant as the overarching issue with the method itself. However, proponents of the method would argue that without an examination of one's self and beliefs, then objectivity in any setting would be void (Allen-Collinson and Hockey, 2008).

In teacher preparation programs, it is important to introduce the purpose for and the use of autoethnography as critical reflection, rather than as research, in this case. Some claim that autoethnography is invalid as a research method because it fails to address the three criteria of more traditional approaches—validity, reliability and generalizability (Allen-Collinson and Hockey, 2008). These criteria, while important for quantitative studies, can still be accomplished to some extent through autoethnography, although this is not the focus of the work. Arguably, the most important use of autoethnography by educators is not to replicate and generalize beliefs, but rather to challenge them for the purpose of enacting social justice.

While pre-service teachers in university programs often engage in traditional research methods, such as action research and thesis projects, it is equally as important for them to understand the *why* behind their work. Without a clear understanding of how their beliefs about teaching and learning were formed, and how these beliefs and values impact their work with students, then candidates engaging in the action research process risk missing opportunities for deep, impactful learning. Autoethnography provides a vehicle for pre-service teachers to accomplish critical reflection about practices and beliefs, while also identifying specific opportunities to enact social change within the classroom. Specifically, inclusive education requires educators to recognize potential barriers and work to remove them before instruction is negatively impacted. Without a reflective practice in place, educators will not have the tools to do this work successfully.

A case for using autoethnography

Many teacher preparation programs require their pre-service teachers to reflect after lessons, especially observed lessons. The intent is for the pre-service teachers to identify what went well and what needs to be changed for future instruction. This practice is considered reflection-on-action, as described in the previous sections. The following scenario is fictional, but based on years of reading reflective journals from pre-service and practicing teachers. An entry like this was a common occurrence in one teacher preparation program, before implementing autoethnography, as a practice for critical reflection.

Today's lesson was supposed to go much differently than it did. I knew it was going to be a struggle when my two students, already receiving special education services, immediately began acting out. I had arranged the desks to ensure they would be apart, but this did not matter. Instead, they sabotaged the lesson completely. One crumbled up his worksheet and threw it across the room to get his friend's attention. The other student was only trying to entertain his peers, rather than engage in the lesson. I don't know what to do. All of the other children were ready to go and listened to the directions. I have already sent the two students to the office, and every time they return to the classroom almost immediately. Why do the administrators keep sending them back without consequence? How are the other children supposed to learn? I did my best work to prepare this lesson.

As this sample narrative demonstrates, there are tones of frustration, assigning blame, and ultimately no recognition of how the pre-service teacher's beliefs and values were driving the lesson. This narrative also suggests that the learning of some students may be more important than others, and that administration needs to address problem behavior outside of the classroom. On a micro-level, the pre-service teacher could examine the structures of the lesson. How was the instruction being provided? Were there different opportunities for all students to engage with the materials? Are the classroom participation rules clear and being followed regularly? On a macro level, this pre-service teacher has the opportunity to think deeply about where these beliefs originated from. How are the beliefs about teaching and learning being perpetuated or challenged? This pre-service teacher would benefit from engaging in critical reflection through autoethnography.

While autoethnography is a useful tool for critical reflection, it should not be the only method; otherwise it risks becoming a trend and not a foundational practice. Positioning autoethnography purposefully into the curriculum as part of teacher preparation is necessary. If autoethnography is firmly in place, then other methods of reflection can be successfully used post-lesson and at other specified times. In these cases, pre-service teachers could then draw upon their autoethnographies in their lesson-specific

reflections to identify where and how their own beliefs impacted their decision-making. Opportunities for change emerge when beliefs are challenged.

The next section of this chapter will provide an overview of how one teacher preparation program implemented autoethnography into the curriculum to support critical reflection among pre-service teachers enrolled in a graduate program. This is one example of how autoethnography can be used in teacher education.

Autoethnography as critical reflection in teacher preparation

The graduate program currently serves pre-service teachers in over twelve areas for teacher licensure in the Northeast United States of America. Some have had previous experience in education, while others are new to the profession. However, all pre-service teachers in the programs hold a bachelor's degree. The graduate students are generally white, middle to upper class students, yet the places these pre-service teachers work are increasingly diverse—economically, culturally, and accessibility.

As the graduate education program reviewed pre-service teacher data, including multiple reflections, exit surveys, and teaching evaluations from the field, it became evident that candidates needed additional opportunities for critical reflection before going on practicum. A review of the data indicated that the pre-service teachers needed a way to critically analyze and reflect on their beliefs about teaching and learning. The majority of reflections and materials collected focused on student deficits or negative responses to instruction, rather than the pre-service teachers' role in the classroom as the instructional provider. The submissions analyzed lacked an aspect of self-awareness, one of the cornerstones of critical reflection. This section will outline the lessons learned from implementing autoethnography into the teacher preparation curriculum.

Autoethnography offers an opportunity to examine beliefs and practices; therefore, integrating it into the early classes in the program was essential. In addition, given the number of programs offered, there was not one course required by all degrees. However, two courses were identified that would ensure all pre-service teachers engaged in the practice of autoethnography. One course focused on writing instruction and the other course on inclusive education. Both courses invite participants to engage in deep, critical reflection about their beliefs about teaching and learning. This is facilitated using focused weekly writing prompts. Each week course participants delve into an aspect of their own experience. This can be challenging for the pre-service teachers. In many cases, their previous experiences are different from the concepts being taught now in their teacher preparation program. For instance, one of the writing prompts asks participants to think about how they learned how to write. Did they enjoy writing as a child? Why or why not. This prompt is done early in the process, as a warm up to the more provocative ones that come later. However, even the basic questions about learning to write offer opportunities to reflect and acknowledge their previous experiences.

An important component of this process includes opportunities to share and discuss ideas that arise from the journal prompts. Write with your students. Engage in the process with them. This will facilitate a deeper conversation, but it does require some vulnerability and disclosure about ones self. Establishing a safe space to share experiences and ideas will help course participants, as well as the instructor to share more openly and honestly. In one of my courses, I shared that my earliest writing experiences were marked with shame and embarrassment because my teacher did not like how I held my pencil. I was given a special grip and made to sit in a special seat so that she could ensure I used it properly. This made me hesitant to write. I allowed my students to ask me probing questions about my experience. This generated a discussion about student accommodations, creating a safe learning space, as well as writing instruction. The discussion gave the pre-service teachers a reason to reflect on my experience, but also connect it to their own. Without the use of autoethnography, this type of discussion would be difficult to generate authentically.

Model texts are also used as a way to discuss and critique autoethnography as a method for reflection. Books such as Phil Smith's (2012), *Across the Table*, offer autoethnographic essays focused on various issues connected to Disability Studies. The essays are great examples of how autoethnography can raise awareness of issues of social justice, generate action, and promote deep reflection. Course participants are asked to read and discuss at least two autoethnographies from the text. The chapter selections are suggested on the syllabus. With the necessary permissions, programs might also consider using exemplars from past students. Interacting with texts in this way allows the pre-service teachers to not only experience the power of the method, but also understand the expectations for the final assignment.

After engaging in weekly writing prompts and engagement with model texts, pre-service teachers are assigned a final autoethnography paper. The final paper must demonstrate the pre-service teachers' ability to critically reflect on a belief or practice. The topic for the final paper can stem from one of the earlier journal entries, but must go into more depth to illustrate a deeper level of mastery. The assignment requirement states five pages as the expectation, but the papers submitted are almost always much longer. By this point, most pre-service teachers have embraced the process and feel comfortable sharing at a deeper level. Trust has been established, which is crucial to the process.

The implementation of autoethnography into the teacher preparation program led to other changes in the curriculum. In an early study, Rice and Threlkeld (2017) determined that pre-service teachers needed specific opportunities to engage with issues of social justice. A deeper analysis illustrated that the pre-service teachers could identify issues of injustice, but did not have the tools to enact change. The autoethnography assignments were an avenue for unearthing the issues, but the pre-service

teachers were unsure of their next steps. This led to the implementation of an action research project during their final semester. Pre-service teachers are in the field, completing their practicum experience, as well as enrolled in a reflective seminar. The seminar course is online and spans a full semester. During this time, pre-service teachers are encouraged to revisit their autoethnography, as well as consider their classroom placement. They are guided to design and implement an action research project, often stemming from an issue connected to their autoethnography. The pre-service teachers engage in specific change based on a previous belief or practice. This process has helped to close the gap between theory and practice; however, more research is needed to determine whether the autoethnography and the action research projects are authentically linked to permanent change.

Conclusion

The origins of teacher preparation relied on individual experiences and knowledge as credentials. Early teachers taught what they knew. Faced with new practices that may differ from their experience as students, teachers require opportunities to critically reflect on these differences. The types of reflection used most often, fall short of the mechanisms needed for critical reflection. Autoethnography introduces a method for reflection that offers an opportunity to think deeply and critically about beliefs and practices related to teaching and learning.

When implemented in one teacher preparation program, autoethnography provided a vehicle for analysis, critical thinking, and reflection on experiences and practices. Done early in the program, this allowed pre-service teachers to continue the process of critical reflection throughout their remaining courses and field experiences. Other types of reflection are used, for example after an observed lesson during practicum, but these opportunities also invite pre-service teachers to revisit their autoethnographies to help draw conclusions and plan next steps. The autoethnographies become a reminder to pre-service teachers that their beliefs about teaching and learning are always present.

As research continues and the field of education grows, the need for critical reflection will remain constant. Dewey (1933) brought reflection to the forefront as a way to heighten awareness, but as the culture of education evolves, a more robust tool for personal examination is needed to ensure that pre-service and practicing teachers will integrate the old practices with the new both purposefully and thoughtfully. Autoethnography can be used to ensure that teachers consider their own experiences and beliefs and the impact this has on practice, while meeting the evolving needs of their students; a necessity Freire (1973) articulates for ensuring that all are represented authentically. Autoethnography is a vehicle for addressing and honoring the changing knowledge and diverse cultures within education.

Introduction

The concept of voices in research has been discussed extensively in the literature (Jackson and Mazzei, 2019; Thomson, 2011). Under the umbrella term “voices,” the concept of “student voice” is also situated, which is the focus of this chapter. The movement of student voice has gained prominence over the last two decades, especially after the UN Convention on the Rights of the Child in 1989 (United Nations, 1989) which has been ratified almost by every country in the world. Despite the reported benefits of student voice approaches there is also a range of challenges that have been reported in research that involves children and young people, such as tokenistic ways of engaging with the views of students and issues of unequal power between adults and children and young people.

Students' voices and inclusive education are interconnected ideas (Messiou, 2012, 2019). Following Ainscow's definition of inclusion as a process that focuses on the presence, participation and achievement of all learners (Ainscow, 2007), I argue that a crucial avenue for enabling participation for all learners, is listening to students' voices. More importantly, moving into dialogs with learners can be a further way for enhancing participation and developing inclusive practices. As Kozleski (2020) argues inclusive education “honors divergent perspectives, capacities, and approaches to learning” (p. 340). The approach described in this chapter, *Inclusive Inquiry*, directly relates to student voice approaches, focusing especially on dialogs between children and teachers, in order to develop more inclusive practices in schools. Such dialogs, it is argued, allow divergent perspectives to be explored, and ultimately lead to changes in practice.

Voice/voices in research

The notion of voice has been problematized in the literature. For example, what constitutes voice has been discussed extensively, drawing attention to moving away from verbal means of communication and highlighting non-verbal means of communication (Thomson, 2008). Mazzei (2009) argues that it is impossible to have voice fully captured in research, while St Pierre (2009) points out that participants' voices in qualitative research may have been burdened with too much weight. She goes on to remind researchers that voice is just one source among many others that qualitative researchers should use in trying to make sense of complex phenomena.

On the other hand, Reay (2006) draws attention to the dangers of the collectiveness of voice, while others have raised concerns about the use of plural. In particular, Mazzei and Jackson (2009) argue that:

This practice of “more is better” has indeed highlighted the ways in which voices are not singular, yet the obsession for more full voices side-steps what we view as a more salient feature of the problem: these practices remain attached to notions of voice inherited from metaphysics – voice as present, stable, authentic, and self-reflective. Voice is still “there” to search for, retrieve, and liberate” (pp. 1–2)

This is a strong reminder that highlighting multiplicity of views is still not satisfactory since such a position assumes voice as a state, whereas voices are constantly changing and emerging and affected through interactions with others. Such views can also be linked to the principles outlined by Blumer (1969) in explaining the term that he coined, that of symbolic interactionism:

- (1) That people act toward things, including each other, on the basis of the meanings they have for them;
- (2) That these meanings are derived through social interaction with others; and

- (3) That these meanings are managed and transformed through an interpretive process that people use to make sense of and handle the objects that constitute their social worlds.

Blumer (1969: 2).

Similarly, it could be argued that voices are constructed as a result of social interactions and relate to meanings that people hold toward others. Through these social interactions conversations and dialogs occur. As Lodge (2005) argues, dialog means to arrive at a point that you would not get to alone and involves shared meanings. Whereas, Wegerif (2019) referring to the Bakhtinian term "polyphonic truth," argues that it is "a truth that emerges from the interaction between a range of voices in a dialogic field and is not so much a final accomplishment as a direction of travel" (p. 13). Finally, as Thomson (2011) argues, "The strongly democratic use of "voice" equates to a call for a public sphere in which there is dialog, reciprocity, recognition and respect (p. 21)." Therefore, the issue of dialog closely relates to notions of voice.

The approach introduced in this chapter, *Inclusive Inquiry*, and a specific example from two schools that used the approach, will explore some of the issues raised here about voice. In other words, the idea of voice as a direction of travel, as well as being fluid and socially constructed within a specific context will be further explored. In addition, through the presentation of this example, an exploration of how different voices can lead to the development of more inclusive contexts with identified changes in practices, will be made.

Students' voices

The notion of student voice, similar to definitions of voice described above, ranges from simple expression of views either through verbal or non-verbal means, while at the same time refers to the idea of active participation and having an active role in decision-making processes (Cook-Sather, 2006). Others have drawn attention to such an active role leading to changes within given contexts. For example, Rudduck (2006) distinguishes between consultation and participation, with the first one referring to talking with students about things that matter in school whereas the second one refers to active involvement in the development of a school's work. Taking such an approach links between notions of voice and participation can be seen.

Back in 1989, the UN Convention on the Rights of the Child (United Nations, 1989), drew attention to children's and young people's rights to be heard. Specifically, in Article 12 it is argued that:

States Parties shall assure to the child who is capable of forming his or her own views the right to express those views freely in all matters affecting the child, the view of the child being given due weight in accordance with age and maturity of the child (p. 5).

The Convention has been ratified by almost every country in the world. Though the Convention was an important step forward, it still entails some controversy around the language used. For example, age and maturity are presented to be significant in determining the importance of a child's view, therefore undermining some children's and young people's ability to have a valid view. Such a position is not in accordance with conceptions of childhood that consider children to be active "beings" (Prout and James, 1990).

Much of the research that focuses on students' voices, starts from notions of childhood that view children as active agents and children's right to be heard. However, the issue of rights leading to opportunities to be heard is only the starting point in voice research. What is of most importance, is how those views are used in order to bring about change. In other words, actions should be taken following an engagement with students' views, in order to ensure that the process is worthwhile. Otherwise, such efforts may have the opposite effects of disengaging students (Messiou and Hope, 2015).

Research in various countries has focused on involving students as researchers with a focus on exploring various aspects of school life (Ainscow and Kaplan, 2005; Carrington et al., 2010; Fielding, 2001; Tangen, 2009; Thomson and Gunter, 2006). Such approaches have various impacts on students, such as "deep participation" (Wilson, 2000) and growth of agency, belonging and competence among students (Mitra, 2003, 2004; Mitra and Serriere, 2012). In addition, other studies draw attention to relationships between students and children becoming stronger (Fielding and Bragg, 2003; Fielding, 2004; Hope, 2012; Baroutsis et al., 2016; Graham et al., 2018).

While there are many benefits as reported above, at the same time research that focuses on students' voices entails certain challenges. The issue of unequal power between adults and students has been highlighted by a number of authors (Mayall, 2001; Mitra, 2008). Though this is inevitable to some extent, due to the age difference, a range of ways has been discussed in order to minimize the effects of this power difference (Morrow and Richards, 1996), not least is the use of methods that allow students' voices to emerge and come to the surface. Essentially, as Fielding (2001) argues such work involves a change in what it means to be a student and, indeed, in what it means to be a teacher. In other words, both parties should be prepared to take different roles, respecting one another when engaged in such kind of work. The issue of teachers resisting to students' voices, or even rejecting their opinions as valid has been reported in some studies previously (Kaplan, 2008; McIntyre et al., 2005). These may stem from resistance to believe that students do have valid views, or from being reluctant to take on different roles, as Fielding suggests.

Finally, another area that has been discussed in relation to voice and research is the issue of silence. Lewis (2010) has pointed out the importance of silence in research that involves students, and suggests five methodological aspects to be taken into account:

1. Recognizing,
2. Noting,
3. Responding to,
4. Interpreting, and
5. Reporting silence from children.

Lewis's (2010) work reminds us how silence is complex and a result of co-construction between researchers or other adults and children, linking again to the ideas of symbolic interactionism. In the same way that people act toward others based on the meanings they have constructed for them, as Blumer (1969) suggests, it could be argued that silence is voice, or action, that stems from particular meanings ascribed to individuals or situations, which have emerged through interactions with others.

In other words, when a child remains silent within a research context, either while being observed in their natural setting, or while being interviewed, this silence could be seen as a form of voice, which derived out of interactions with others within a given context. Those others could be the researchers who led to these silences through their own questioning or actions, other children in a classroom setting, or the teachers who may have led to these silences through their own reactions or words. As Lewis (2010) puts it, "Listening better includes hearing silence and that silence is not neutral or empty (p. 20)." Silence can therefore be seen as voice, linked to particular situations and interactions and should be recognized and explored in depth.

Conditions for voice

Focusing within the classroom context, Lefstein et al. (2020) highlight four conditions of "voice":

1. Having the opportunity to speak;
2. Expressing one's own ideas;
3. Speaking on one's own terms; and
4. Being heeded.

Alexander (2019: 667) suggests that these conditions "prompt four questions:

1. What do we do to encourage our students to speak?
2. How do we ensure that what they say is treated equitably and respectfully?
3. When students speak, whose voices do we hear?
4. And how do we handle contributions that digress from our agenda?"

Although these issues have been raised in relation to voice in lessons, they relate to the ones posed by Fielding (2001) about student voice in research and in schools. Fielding proposed a list of questions, organized in nine clusters:

- Speaking,
- Listening,
- Skills,
- Attitudes and dispositions,
- Systems,
- Organizational cultures,
- Spaces,
- Action, and
- The future.

These, he observes, can point toward areas that need further development in efforts toward promoting democratic dialogs in schools. These clusters and the related questions can guide efforts to understand "more clearly and more acutely what conditions are most likely to foster student voice as a transformative force rather than as an unwitting adjunct to the increasingly irrelevant and pernicious paradigm of school effectiveness" (p. 133). As he argues, these questions "apply equally well to any set of arrangements which seek to move more closely and more authentically to a practice of dialogic democracy" (p. 133). The approach described in this chapter, *Inclusive Inquiry*, had as its central feature the idea of dialog, with a focus on creating more inclusive environments and ultimately arrive at what Fielding describes as the practices of dialogic democracy. In addition, Mitra (2008), using the concept of "community of practice" as a lens, suggests a number of strategies in order to strengthen student voice initiatives. She is arguing for the need to build "meaningful roles based upon mutual responsibility and respect among all members; developing shared language and norms, and developing joint enterprises aimed at fostering voices that have previously been silenced from decision making and knowledge-building processes" (p. 221).

Moving away from notions of voice as stable and taking the position that voices are created through a set of complex interactions, influenced by the way that others contribute in dialogs as they occur in particular contexts, in what follows I set out to explore how voices were constructed as part of an approach that was used in various schools with the aims of enabling all children to

participate in lessons and develop more inclusive practices. The approach has emerged through collaborative work with colleagues in five countries where we attempted to ensure that all students' voices are heard. The dialogs, take place mostly outside the classroom context, when children and teachers get together in order to design collaboratively a lesson that aims to reach out to all children.

Inclusive Inquiry

Inclusive Inquiry is an approach that has emerged through the work of two inter-connected studies which were funded by the European Union. The first study involved secondary schools in three countries (England, Spain and Portugal) (Messiou et al., 2016) and the second involved primary schools in five European countries (Austria, Denmark, England, Portugal, Spain). Both studies employed collaborative action research as a methodology, where different stakeholders took the role of co-researchers (Mitchell et al., 2009).

Inclusive Inquiry involves teachers and children working together to co-design lessons that are inclusive (Messiou and Ainscow, 2020). The approach involves three phases: Planning, Teaching and Analyzing. Each of the phases consists of 12 specific steps. These comprise a "Levels of Use Framework" that can be used by teams of students and teachers who are working collaboratively to help them with discussions about the extent to which the approach has been followed consistently. A distinctive feature of the approach is the involvement of some students as researchers collecting and analyzing their classmates' views about learning and teaching, and observing and refining the lessons in collaboration with their teachers.

In practice, schools that use the approach have to form groups of children and teachers who will collaborate for the implementation of the approach. Usually, these groups consist of three teachers, ideally teaching the same age group, and a total of nine student researchers, three from each class. Teachers are asked to choose children from their classes that are seen as "hard to reach" who will become researchers, such as disabled students, those with migrant backgrounds or others that lack confidence or are not focused enough in lessons. These students are then trained by their teachers on using various methods to collect their classmates' views, as well as on how to conduct lesson observations. They then go on to collect their classmates' views about learning and teaching and analyze their ideas. These ideas are then used to inform the design of a lesson that they plan collaboratively with their teachers. Once the lesson is designed, it is then taught by the first teacher while being observed by the other two teachers and the student researchers who are not from that class. The student researchers have been trained to carry out observation focusing on the activities of the lesson and whether they allow all children to participate or not. At the end of each lesson the student researchers from the other classes who were observing collect students' views about the taught lesson. Their views are taken into account and brought to the discussion that follows the lesson between teachers and student researchers. The discussions focus on identifying ways in which the lesson activities allowed all children to participate as well as suggest possible changes to allow for greater participation. The changes to the lesson are made before the process is repeated three times. After the three lessons have been taught, student researchers and teachers discuss the wider implications for practice that are identified, and these are implemented in various future lessons with a view to enabling better participation of students in all lessons.

Over the three years of the project, data were collected and analyzed in the thirty schools in the five countries. The analysis of the data has highlighted some significant impacts on teachers' thinking and practices and, more importantly, on the student engagement particularly for those students that took the role of researchers.

A set of materials offering step-by-step guidance have been developed that can be used by schools who wish to implement the *Inclusive Inquiry* approach. These have been prepared in five languages (English, Danish, German, Portuguese and Spanish) and can be downloaded for free from the project's website (www.reachingthehardtoreach.eu).

Getting started

The example that will be used aims to illustrate how dialogs within schools that used *Inclusive Inquiry* led to change in practices. At the same time, it will illustrate the fluidity of voices.

The example relates to two schools that are on the same site, English School 1 Infants and English School 1 Juniors. The two schools worked together for this project. Both schools were smaller than an average-sized primary school with 178 pupils and 201 pupils respectively. Four teachers were involved in the project: two from the Infants School (Year 2 teachers, 6–7 years old children) and two from the Junior School (Year 3 teachers, 7–8 years old children). One of the year 2 teachers led the whole process, the one who facilitated the children researchers training but was not involved in the teaching of the lessons.

A range of criteria were used to select the student researchers. Three were chosen from each class. There were four boys and five girls. A number of these children were seen by the teachers as not being confident, while others were children who were in receipt of pupil premium (additional funding for publicly funded schools in England to raise the attainment of disadvantaged pupils and close the gap between them and their peers), but at the same time lacked confidence and interest in learning. There was also a child who was negative toward other children in the class and rude at the same time; while another one was not behaving appropriately in class. Overall, the majority of the chosen children were children who lacked confidence.

Before the planning of the research lessons, the teacher facilitator had trained the student researchers, who then collected their classmates' views. Specifically, the student researchers had three sessions to be trained as researchers. During the first session they focused on exploring the children researchers' own views about learning, specifically what helps them and what makes it difficult for children's learning. The second session focused on how they would explore their classmates' views about learning and teaching. During the final session of training, they focused on how to carry out lesson observations. When the children researchers collected their classmates' views in all three classes, the most popular answers were the following: to use videos and to have games.

Co-designing lessons

At the end of this process the three teachers who were going to teach the lessons, the teacher facilitator and the nine student researchers all got together to discuss the lesson planning. This session started by the children researchers explaining to the teachers how they gathered their classmates' views, followed by a presentation of the findings from each class in relation to what children thought helps with their learning, such as the use of games and videos. Then the teachers explained that since the lesson that they had to plan would take place in both Year 2 and Year 3 classes, they decided to focus on a lesson about reading for pleasure, since this is something that they do in both year groups. They then asked the children researchers to discuss in small groups, with the support of one teacher in each group, about the various skills that are needed for reading. The children mentioned the following skills: fact finding, unknown words, predictions, inference, listening and summarizing. The teachers sometimes had to prompt children in order to remember and name some of these skills. Then the teachers asked them to focus on a skill that they are not so good at. They all agreed that prediction was a skill that they are not very good at. Therefore, they decided to focus on prediction for this lesson. The children worked again in small groups in order to think of various ideas that would help with practicing prediction. At the end they shared their ideas with the whole group. For example:

T1¹: We had a really good idea around the table. Should we share? What do you think we could do? I think from listening you have the same idea that we have as well. What's your idea?

S3: So, we could do it's like what half of the video clip and in our books, we could predict what's gonna happen next and predict who the author is.

T1: Ah good idea, what about D. here. Do you have similar idea?

T2: It's similar but J. has a really good idea. What could we do?

S2: So, we can like watch a video clip and then we can like predict what's gonna happen next and then we can watch the rest.

T2: What did you say before that? What could we do to help our prediction?

S2: (remains silent)

T2: I can say J. said we can do some drama so we could act it out, couldn't you? That's what you said, didn't you?

T1: That's one of the things that you've all said ... more interesting, didn't you? J. what's your idea (to another student)?

S5: We could read a book and then you predict what maybe gonna happen next.

T1: Fantastic any other ideas? A.?

S4: We have a story of Iron Man so we can watch a video clip and then we can like predict what's gonna happen next in the book.

Teachers all agreed:

T1: I think we can choose something that definitely nobody's read or watched before otherwise they'll know the answer and then you won't be able to predict. Any other ideas? M. was talking a lot about being able to move around the classroom weren't you. Can you explain a bit more?

S3: Or outside because you could have a game of like an adventure, then what we learned about, then could like put teddies around, then we can come back together, then answer questions of what we see kind of like that ...

T1: Any other ideas?

What was impressive here was that the teachers enabled the children to see that there was a clear purpose for this lesson—to develop the prediction skill and, therefore, any of their suggestions had to be linked back to this objective. Toward the end, it seems that S3's idea about moving outside the classroom, is not really taken into account and explored in more detail.

Having decided on the use of a video to predict what is going to happen next, the teachers moved on to exploring how the children were going to work.

T1: I've got a question for you. There're some good girls over here also said we can watch something and we can stop it and we can predict I said how would you like to do that? Would all everybody sit silent and write it in their books? How would you like to do that? Anyone's got any idea? What are the different ways we could do that?

S3: So we could like talk to our learning partners.

T1: Brilliant. Is that what you said? What did you say A.?

S8: We can make the game.

¹T: Teacher, S: Student.

T3: No, no, you said one of them was doing it on their own what did you say to me? You do with ...

S8: Buddy.

T1: Learning buddy. You have learning buddy, haven't you? We could do it with learning buddies. How can you do it? There could be one you, there could be two of you, you could work in a ...

Students: Group.

T1: Group ok. What do you think? What do you think is the best way to do it J.? or what do you think might work?

S: uhm ...

T1: The idea was what would you like to do it. If you are asked to do a job, would you like to do that job on your own, in a group or with a partner?

S: group.

The teacher facilitator then asked each student researcher whether they like working in a group, with a learning buddy or on their own and most of them chose as their preference working in group.

At the end of this planning session, the three teachers stayed a little longer to finalize the details of the lesson. What emerged through their discussion was that since the researchers would be observing the lesson in the other classes, they would have seen the video. Therefore, each lesson had to use a different video in order to allow all children to be able to practice the prediction skill. The teachers found three different videos to use in each lesson.

Dialogs that lead to changes

The first lesson was taught and observed by the student researchers from the other classes and the teachers. Following the first lesson, the teachers and the student researchers who observed the lesson had a discussion. The first person who spoke was the teacher who taught the lesson who said how she felt that the lesson went well overall. However, on reflection and if she had to teach it again, she thought that she would probably need to focus more on the justification of their predictions and for them to be in a position to explain a bit more why they thought that of a specific prediction. The teacher who led the discussion was the one that led the training of student researchers.

T1: What did you notice when you were watching the children?

S1: They were quite interested.

T1: What did they do to show us that they were interested?

S2: They were looking at the teacher.

S3: And listening.

T1: Were they listening to each other when they were working in groups? What do you think? What ideas did you write down?

S3: Some children had arm crossed.

T1: Yeah, what did that mean?

S3: It's err they were bored or something.

T1: But why they do their learning journey when you went closer to watch them, were they bored or were they enjoying the lesson?

S4: There were those like sitting there doing nothing.

T1: Okay so do you think that they were listening?

S4: No.

T1: Some children, we talked about some of children, weren't talking when they were sharing with others, lots of children were talking. What could we say might be a better way to get that conversation kind of all the children? What do we talk about? What could happen in that part when all the children were sharing ideas and some children were sat that ... like this. What do you think the teacher should do next time? What could we do in the lesson next time?

S5: Play a little game.

T1: How could we do that? How's that gonna help everyone have a turn? What did we say we could do next time to make sure everyone have a turn?

S1: So, like we could start from one person and then we go around to last person.

T1: So that everybody gets a chance to talk, didn't you? Everyone gets a turn to talk before they all start writing I thought that was a really good idea.

Again, here we see how a student's suggestion that children may be bored, which is then repeated by another student, is given attention by the teacher who leads the discussion. At the same time, it does seem like the teacher was trying to make them think more critically and move beyond what children's non-verbal communication was suggesting and think of alternative explanations, while she is also becoming more focused on children who did not appear to talk in their groups. Through sharing their observations, both teachers and children researchers started thinking about possible changes to the next lesson, to enable greater participation, and the children had some good suggestions about how to enable all in a group to have a say. One of the changes for the second lesson, was related to this aspect. Whereas in the first lesson the children worked in groups of five in the second lesson they reduced the number to three and each child had to express their views taking turns.

Thinking about voices and dialogs through this process

Returning to Lefstein et al. (2020) conditions of “voice” and Alexander’s (2019) related questions, it can be argued that through *Inclusive Inquiry*, all children were given the opportunities to express their views. Though the ones that were student researchers had a more prominent role in the whole process, at the same time all students were asked to express their views about learning and teaching before the design of the lesson. The fact that their views and ideas were taken into account to design the lesson, was a clear indication that their views were respected and treated equally. This was emphasized at the start of each of the lessons and it was important in communicating this to the students. Therefore, all children were given meaningful roles, as suggested by Mitra (2008).

However, the dialogs between teachers and children were more in depth with those who took the role of researchers. In the example here, we saw how the students drew attention to children in the lesson who may have been bored. Even though the teacher was trying to give them an alternative perspective and make them think more critically, at the same time she was also becoming more critical about what she was observing and why some children may have appeared to be disengaged by having their arms crossed. Therefore, we can see how dialogs outside the classroom context about a lesson were indeed allowing space for children to express their views, based on what they thought when they observed the lesson. This differs to the example presented by Lefstein et al. (2020) where, in the lesson that they observed, as they argue, though some of the contributions were student initiated, the contents were directed by the teacher, to the extent that the teacher’s voice was dominating. Whereas in our example, though the discussion was certainly led by the teacher, it could be argued that the children researchers’ suggestion of some children appearing not being engaged in the lesson that they observed was what brought into sharper focus details of the lesson. Specifically, the student researchers suggested what they called a game, which in essence was turn taking in group work, ensuring that everyone talks in a smaller group. Though this might seem obvious and a common practice among many classrooms, as a basic group skill, it was evident that this was not used in the particular classroom.

Final thoughts

The introduction of the student voice agenda to research, has been a welcome one and much needed. It could be argued that much of the research falling under the student voice umbrella term runs the risk of marginalizing certain voices, such as those of adults, in the effort of giving weight to students’ voices that have been traditionally marginalized.

Through *Inclusive Inquiry*, it is the coming together of different perspectives, those of adults and of children, that are important. Together these different perspectives, through the process of dialog aim to arrive at creative ways of working and ensuring that all children are included in the process of learning. Slee (2018) points out that our efforts should be “directed toward the ways in which institutions can pursue structural and cultural adjustments to support inclusion” (p. 67). I am arguing that dialogs between children and teachers facilitated such adjustments and led to changes in practice to enable all students to be active participants in lessons. Such notions of participation, strongly relate to the notion of voice. Students and teachers collaborating can embark on common journeys, and through dialogs such as the ones described here identify possible *directions of travel* for developing more inclusive practices.

Overview of Indigenous models of education before contact

When Europeans made their way to what is now known as Canada, Indigenous Peoples on these territories were sovereign nations who lived and enacted their systems of education through their everyday activities and life. Indigenous Peoples have engaged in their own education systems which were informed by their epistemologies. Indigenous societies have always had their own economies, leadership structures and knowledge systems. That was as true then as it is now (Coates, 2018; para 11).

Long before the arrival of Europeans and the creation of Canada, Indigenous People lived on their ancestral Lands on which they implemented their own ways of living (Assembly of First Nations, 2018, 26). They lived in harmony with, and were respectful of, the Land. According to McCue (2011, Para 1), traditional education among most Indigenous People was accomplished through various techniques, such as observation and practice, family and group socialization, oral teachings and participation in community ceremonies and institutions. Tenning (2010) explains Indigenous worldviews on teaching and learning, observing that children were also learners and teachers whose skills developed as a result of reflection, collective deliberation, and experimentation. Indigenous forms of education are not static. According to McKinley and Smith (2019, p. vii), "... these education systems had no ending: each generation expanded the community's knowledge base".

Three Laws of Relationship (Western Canadian Protocol for Collaboration in Basic Education, 2000, as cited in Laramee, 2008, p. 57) discusses key characteristics of Indigenous worldviews which guide education and interactions of most Indigenous Peoples of the Land. First, The Law of Relationship with the self, the Law of Relationship with nature and the Law of Relationship with the Land guided the behavior of learning and living.

Indigenous Peoples and the knowledge systems of First Nations were often guided and grounded by relationships with each other and to the Land and by their community, with an effort "... on preserving a physical, emotional, mental and spiritual balance" (Coates, 2018, para. 2). Indigenous Education comes from the Land and from oral traditions. Elders constitute a key part of Indigenous People's teaching, learning and identity. Beyond the family, the community and the Elders, Indigenous Education is also born from the ancestral territories. Indigenous Education is distinct to each Indigenous People and Indigenous nation (Lifemosaic, 2020). Indigenous knowledges and pedagogies are complex. They are focused on experiential learning and on lived experiences that are meant to be enjoyed, but which also serve a deeper purpose. These concepts are meant to encourage both individual and collective responsibilities, which are crucial to Indigenous life and wellbeing (Coates, 2018, para. 5).

Tenning (2010) asserts that "... at the core of Indigenous forms of education was the value of respect: respect for oneself, for others, for the Creator, for the environment, for the ancestors, and for the generations to come in the future" (para 8). Indigenous People at the time were and still are self-determining nations with their own languages and governance systems which include their education (see Carr-Stewart, 2019, p. 7).

In Canada under its constitution, there are three recognized groups of Indigenous Peoples including, First Nations, Métis, and Inuit, under section 35 of the Canadian constitution (Tenning, 2010). Indigenous People's educational systems were impacted by the onslaught of colonial education and laws violently forced on them.

Institutionalized violence and forced education systems

European contact with Indigenous People in Canada, and particularly at the school systems which the Europeans, and Euro-Canadians designed for, and imposed upon Indigenous People are examined in this section of the chapter. Further, the term "Indian" sometimes appears in this discussion when referring to some Indigenous or First Nations Peoples. This is for two reasons. First, the word "Indian" is used in historical sources and may appear in direct quotes. Additionally, "Indian" is the legal term that is found in many government reports, and it is embedded in federal legislation in Canada, such as Canada's Indian Act, which imposes on and regulates the status of First Nations People. As a result, the context sometimes requires the use of this word.

Mission schools

In fact, Carr-Stewart (2019, p. 7) emphasizes the argument that with the arrival of Europeans, Indigenous Peoples and their education systems experienced dramatic and rapid changes. Indigenous Education systems were intentionally ignored since the goal of European governments was to colonize and control Indigenous People's lives. Successive governments and Christian churches have, for hundreds of years, dedicated their time and were determined to control, and ultimately erase, Indigenous Peoples and their knowledge systems and pedagogy, and this has had a major impact on Indigenous People's identity and lives (see Coates, 2018, para. 3).

For more than 200 years, from the early 1600s to the 1800s, before Canada's residential school system, which was aimed at forcing Indigenous People to forget their identity, became official in the 1800s, Christian missionaries ran mission schools which were aimed at teaching Christianity to Indigenous children. This was the precursor to the Government of Canada's residential school system (see Canadian [The Canadian Encyclopedia](#), 2020). Religious mission schools have existed in Canada since at least 1620. In that year the Recollect Order of Franciscans (Roman Catholic) organized schools at Quebec, which functioned until 1629 (see [Anishnawbe Aski Nation](#), 2005). By 1636 the Jesuits established a school in Quebec and accepted several students. However, many parents refused to send their children to the school because it was too far away from home (see [Anishnawbe Aski Nation](#), 2005). There were many attempts to establish schools for Indigenous children, such as the Ursuline Sisters' establishment of girls' schools in Quebec in 1639. In the early 1600s various Roman Catholic orders set up schools. The Catholic Church's strong efforts to set up schools did not last long (see [Miller](#), 1996). The Mohawk Institute was the oldest continuously run Anglican residential school in Canada, starting from 1828 (see [General Synod Archives](#), 2008). What's more, missionaries continued to establish Day schools and Boarding schools for First Nations and Inuit children from the 1600s to the 1850s (see [Kanai Board of Education](#), 2005).

It is widely known and well-understood that Indigenous People have their own forms of spirituality, education and governance systems, and at no point in time did Indigenous leaders see themselves in need of Christian conversion. They did not see education as a means to be used to assimilate their children or their communities. After all, they had their own ways of life that worked well. With the new changes that were imposed on them as European settlement, and with it European tyranny grew, and with Indigenous People's understanding and worldviews of thinking of the wellbeing of future generations, Indigenous leaders saw education as a way to adapt to the new changes, although not at the expense of Indigenous People's own governance and education systems (see [Kanai Board of Education](#), 2005).

Yet, Europeans used education as one of the ways in which they carried out their colonial project of acquiring Indigenous Lands. The Royal Commission on Aboriginal People, [RCAP](#) (1996, p. 232) explains that, of all the processes that they used to try to achieve the goal of colonization and assimilation, "... none was more obviously a creature of Canada's paternalism toward Aboriginal people, its civilizing strategy and its stern assimilative determination than education". The dissatisfaction of not reaching the goal of assimilation and Christianization through mission schools ultimately led the government to develop aggressive policies and laws which were focused on further removal of Indigenous People.

Indigenous People continue to experience the destruction of their cultures, the dismissal of their rights and the aggressive assault on their identity through Canada's residential school system. The term residential schools refer to an extensive school system which the Canadian government established, and the churches administered. This school system's objective was to force their education on Indigenous children. However, it also had the more damaging, and equally explicit, objectives of indoctrinating Indigenous children into Euro-Canadian and Christian ways of life and thought, and of assimilating them into Canadian society ([Hanson](#), 2009).

For example, the government—first Britain (before Canadian Confederation in 1867) and later Canada (after Confederation in 1867)—developed key reports to facilitate the process of their intended assimilation of Indigenous People.

Key assimilation reports

Decades of dedicated efforts by governments, churches, and others to erase First Nations' knowledge and pedagogy continues (Coates, 2018, para. 3). For example, The Bagot Commission, which was in effect from 1842 to 1844, presented its report to the Legislative Assembly in 1845. Its recommendation was that the separation of children from their parents was the best method of reaching assimilation into the Euro Canadian culture. The commission also recommended that the Mohawk Institute should be considered a model for other industrial schools (see Canadian [The Canadian Encyclopedia](#), 2020).

The historical records provide ample evidence of the intention of European governments of what the [Truth and Reconciliation Commission \(TRC\) Report](#) (2015a) terms a policy of cultural genocide. The Truth and Reconciliation Commission Report describes cultural genocide as the destruction of those structures and practices that allow the group to continue as a group, and it states that the aim of cultural genocide is to destroy "the political and social institutions of the targeted group". The Truth and Reconciliation Commission Report adds that the Land is taken away and the targeted population is forcibly removed with restricted and controlled movements. Also, ancestral languages and spiritual practices of the group are prohibited, and, importantly, Indigenous families' structures are disrupted. All of this serves to block the transmission of cultural values and identity intergenerationally ([TRC](#), 2015).

As a matter of fact, the fifth recommendation of the Bagot Report (1845, p. 8) recommended that:

... the establishment and maintenance of schools, which instruction shall be given as in the rudiments of education, as in agriculture and some of the handicrafts, and the English as well as the French language taught; and to promote these objects it is suggested for consideration, with some of the medals or ornaments now given as presents, might not be converted into prizes for proficiency in these pursuits; and whether it might not be advisable to make the gift of presents to Indians and their Families, conditional on their sending their children to such schools.

In 1847, another main individual in the attempt to establish residential schools was Egerton Ryerson. At the time, Ryerson was the superintendent of Education for Upper Canada, now the province of Ontario. In the report of May 26, 1847, Ryerson wrote the following:

Their purpose should be to 'give a plain English education adapted to the working farmer and mechanic' and in addition 'agriculture, kitchen-gardening and mechanics so far as mechanics is connected with the making and repairing the most useful agricultural implements'. To attain their objective, it would be necessary for the students to reside together, with adequate provision being made for their domestic and religious education.

Ryerson also recommended that the schools should be operated by the church and funded by the government (Kanai Board of Education, 2005, p. 175). After the release of Ryerson's report, Methodist missionaries organized and directed a number of schools in Southern Ontario in the 1850s (Truth and Reconciliation Commission, 2015c, p. 22).

In 1867 the British Parliament passed the British North America Act which created the Dominion of Canada, and responsibility for governing this new Canadian entity was passed to the new Canadian government. Under Section 91 of the Act, the relationship which the British had with First Nations was also transferred to the newly formed Canadian government (Kanai Board of Education, 2005, p. 50). There was no consultation with First Nations People who were (and are) themselves sovereign nations. The lack of consultation reinforced the paternal relationship and unequal power relations, revealing how the British and later Canadian governments perceived Indigenous People.

Even more, in 1879, Nicholas Flood Davin released a report which examined the boarding school models in the United States. This report called for a model of schooling in which children would attend schools which were far away from their homes, families, and communities. The report referred to these schools as "industrial boarding schools." They came to be known as residential schools in Canada. According to Davin, "... the schools would be more successful because they could be completely removing children from their homes where, they can no longer be influenced by their parents" (Davin, 1879, para 7).

Using the US schools as a model, Davin's report called for the creation and funding of off-reserve schools to teach children the skills which he felt they would need at the time in the contemporary Canadian economy. He advised the government to set up boarding schools rather than day schools. Residential schools, it was reasoned, would be more successful because they could completely remove children from their home environment and influences (Para 7). Meanwhile the then Prime Minister of Canada, John A. Macdonald, and the rest of the government and churches fully supported Davin's recommendations (Union of Ontario Indians, 2013). In the 1800s the government and churches established partnerships to carry out their goals of evangelizing and assimilating Indigenous youth. In 1868 there were two residential schools in Canada, but by 1894 there were 45. This demonstrates the growth of aggressive assimilation. Over 130,000 residential schools were built in Canada, with the last to close in 1996 (Truth and Reconciliation Commission, 2015e, p. 7).

The impact of residential schools

Subsequently, the system of residential schools in Canada was designed to eliminate Indigenous Peoples and their identity. When students entered the schools, their languages were assaulted, and their identity attacked. Indigenous children experienced punishment for speaking their languages and foreign dominant colonial languages such as French and English were officially enforced (see Truth and Reconciliation Commission of Canada, 2015a; Report of the Royal Commission on Aboriginal Peoples, 1996). Canada's residential school is only one part of the history of imperialism on Indigenous peoples and their Lands over the past 500 years. It is also part of the history of the settler colonial Canadian state and, as the Truth and Reconciliation Commission asserts, "that history is not over" (Truth and Reconciliation Commission of Canada, 2015b).

It is well-understood that Indigenous People have been on their ancestral Lands since time immemorial. Prior to disruption by settlers, there were an estimated 450 Indigenous languages and dialects in Canada belonging to 11 language families (see McIvor, 2008, p. 14). According to Statistics Canada (2016), more than 70 Indigenous languages were reported in the census with languages divided into 12 language families.

The eradication of Indigenous languages impacts identity, and "(T)he impacts of language loss are profound and devastating" (National Association of Friendship Centers, 2018, p. 4).

Indigenous languages were highly impacted and remain “critically endangered.” Yet, Indigenous People have developed creative ways to exercise and assert their sovereignty through language by using technology and social media platforms to engage and reclaim their languages. This is demonstrated in the many Indigenous language apps, TikTok videos and YouTube language classes with both Elders and youth engaging through technology. Indigenous organizations and Indigenous schools are focusing on and prioritizing Indigenous languages within their environments. For example, there is a Bachelor of Arts in Ojibwe Languages at the Six Nations Polytechnic in the province of Ontario. These are some of the creative ways in which Indigenous People continue to renew their languages (Six Nations Polytechnic, 2022).

According to the Truth and Reconciliation Commission of Canada (2015d, p. vii),

For most of the system’s history, students were strapped and humiliated, and in some of the residential schools, they were handcuffed, shackled, beaten, locked in cellars and makeshift jails, or displayed in stocks. In addition, overcrowding and a high student ratio meant children who were not subject to physical abuse still grew up in an environment of neglect.

According to the Report of the Royal Commission on Aboriginal People (1996, p. 349) “... the very language in which the vision of residential school was structured revealed what would have to be the essentially violent nature of the school system in its assault on child and culture”.

Consequently, when Canada attempted to disconnect Indigenous children from their parents, sending them to residential schools it was done ... to break their connection to their culture and identity (Truth and Reconciliation Commission of Canada, 2015e).

Many government officials upheld and acted upon these ideas. These officials included, among others, Davin in his 1876 report and Duncan Campbell Scott, another Canadian government bureaucrat, who in 1924 expressed how crucial he felt it was “... to get the children away from their parents and get them while they are young”. According to a Department of Indian Affairs annual report (1890, p. 15):

It would be highly desirable, if it were practicable, to obtain entire possession of all Indian children after they attain to the age of seven or eight years and keep them at schools of the industrial type until they have had a thorough course of instruction, not only in the ordinary subjects taught at public schools, but in some useful and profitable trade, or in agriculture, as the aptitude of the pupil might indicate he was best fitted for. Were such a course adopting the solution of that problem, designated “the Indian question” would probably be affected sooner than it is likely to be under the present system.

These schools were part of a larger government policy which had, at its heart, Canada’s 1876 Indian Act, which was designed to legislate and control the lives of Indigenous People. The Indian Act both imposed and determined ideas of who they believed Indigenous People were under Canadian law. These laws, and the processes which the laws codified, also determined (and continue to determine) when Indigenous People were no longer Indigenous (Truth and Reconciliation Commission of Canada, 2015d, p. 11). Nevertheless, Indigenous Peoples are distinct and unique nations in what is now known as Canada today. They knew who they were then as they do now.

Meanwhile, it was estimated that over 6000 children died in Canada’s residential schools. Recently, the bodies of hundreds of Indigenous children were located in unmarked graves and, as of August 2021, it is estimated that over 1300 unmarked graves were noted at various residential school sites in Canada (see Voce et al., 2021). The unmarked graves were not news to many communities. In fact, the Truth and Reconciliation Report, Volume 4, (2015 p. 11) stated that “On the basis of the work undertaken to date, it is apparent that there are likely to be other unidentified residential gravesites across the country.” There is nowhere in the world where any parent would send their children to school to die. These schools operated for over 100 years with more than 100 and 50,000 students forced into attendance (Truth and Reconciliation Commission of Canada, 2015e). Both Indigenous parents and their children resisted these schools in many ways. For example, according to Kostecky (2019, p. 86) residential schools can be understood as containing “geographies of resistance”, wherein places of oppression can also be seen to include “areas of resistance, resilience, and endurance.” As Indigenous People’s advocacy and activism led to the phasing out of residential schools, Indigenous People themselves established “effective regional and national organizations and, in the courts and the legislatures, they advocated for their right to self-government” (Truth and Reconciliation Commission of Canada, 2015e, p. 129). These procedures related to the Residential Schools were part of overwhelmingly destructive, oppressive policies to remove Indigenous People as distinct Peoples and to assimilate them into the Canadian society (Truth and Reconciliation Commission of Canada, 2015e, p. 3).

Indigenous children and parents resisted this policy in multiple ways. For example, some parents refused to enroll their children as students, or they sometimes refused to return children to school. They also advocated for the government to improve the quality of education, food, and clothing in these schools. As the Truth and Reconciliation Commission reported, in taking these steps, parents often put themselves at risk of legal reprisals (Truth and Reconciliation Commission of Canada, 2015e, p. 114). This is because under Canada’s Indian Act, residential school attendance was mandatory. Therefore, refusing to send the children to school meant Indigenous parents could be criminalized under Canadian law.

Significantly, Canada’s residential school system was not created by any single individual or law. It developed from the days of mission schools in the 1600s, and the pervasive mentality developed over time as new laws and policies were created and

implemented. It was systemic and institutionalized in the British laws, and later in Canadian law, by people who believed in the assimilationist colonial project and were adamant about its success (Adams et al., 2018, p. 24).

Federally run day schools

In addition to residential schools, some mention of the federally run Day schools is critical in understanding Indigenous People's experiences of Canada's broader colonial project. This is an area not frequently researched, and the experiences of federally run Day School Survivors are critical to understanding Canada's Day Schools that operated alongside residential schools. These schools were funded, controlled, and managed by the government of Canada. They were not residential schools (Grand Council of the Crees, 2019).

Rather, Day schools had First Nations, Métis and Inuit children attend during the day, but the students lived away from the schools.

Both residential and Day schools were part of the genocidal project of settler-colonial Canada (Wall, 2019, para. 11). For example, in the province of New Brunswick, there were 12-Day schools, there was no residential school. Currently, there is a Class Action lawsuit, called the *McLean Class Action*, concerning federally run Day schools. This is, yet another example of Indigenous People asserting their sovereignty. A quick review of the list of federal Day schools shows that hundreds of Day schools operated throughout Canada (see *Federal Indian Day School Class Action*, n.d.). These federally funded Day schools were run by many Christian churches including Roman Catholic, the United Church, Methodist, Anglican, Mennonite, Presbyterian, and Salvation Army. There were also a few non-denominational schools. These were different from the original mission schools which were discussed earlier in this chapter and were operated by missionaries (Kanai Board of Education, 2005, p. 181).

This chapter does not discuss another aspect of Canada's system of control—that is, the Day Scholar experiences. Day Scholars are students who attended the same Residential School systems as many First Nations, Inuit, and Métis students. However, they did not sleep at the school overnight (see *Justice for Day Scholars*). The Day Scholars were not included in Canada's 2008 federal apology to Residential School Survivors, and the Day Scholars also have a Class Action suit called (*Gottfriedson v. Canada*) (Grand Council of the Crees, 2019). This is a critical example of Indigenous self-determination, particularly, considering that Indigenous People under Canada's Indian Act were prohibited from hiring lawyers until amendments were made to the Act in 1951. And, despite being a Day Scholar like the Day school experience, the Day Scholars experienced assault to their languages, cultures and identities in these colonially imposed schools.

Wall (2019, para. 9) points to the need to see the linkages between these institutions and activities, and to gain a deeper understanding of Canada's objectives in setting up residential schools and "... the techniques used to that end, are decipherable in connections between residential and Day Schools". In reference to Day schools, Suddath (cited in *CBC News*, 2020, para 6) asserts that the education system was "... mandatory, colonial, religious, paternalistic and discriminatory". Suddath states further that: "It did not reflect the traditional Indigenous ways of educating their children. So, it's a collective trauma that will take generations to heal."

According to Wall (2019, p. 18), this illustrates the "... genocidal context within which the system was established and endured". According to the recent final report of the National Inquiry into Missing and Murdered Indigenous Women and Girls (*Manitowabi*, 2019, Volume 1A, p. 25), "this is genocide".

In the Assembly of First Nations policy statement called "Indian Control of Indian Education" which was released in 1972, First Nations leaders called for a change that would make education relevant to the philosophy and needs of First Nations People (Tremblay, 2001). The history of residential school, Day school and Day Scholars' experiences show that even under oppressive conditions, Indigenous People found ways to assert their self-determination. Indigenous People have initiated, led, and developed their own schooling systems. There is an understanding that education is crucial to governance and identity.

Abu-Saad and Champagne (2006) remind us that the delivery of education to Indigenous Peoples has been problematic. Indigenous Peoples and communities are living cultures. "Their worldviews, institutions and current actions are designed for the future" (Abu-Saad and Champagne, 2006). Indigenous People have the right to determine when and how jurisdiction will be exercised over the education of their children. Only First Nations communities have jurisdiction over the education of their people (Tremblay, 2001, p. 17). Indigenous Peoples globally are reasserting their cultures and redefining their political, economic and social systems. Key to this process is ensuring that Indigenous youth continue to develop a sense of pride in their ancestral territories through their own education (see Maina, 1991, p. 294).

Whether in rural or urban contexts, Indigenous People are drawing on their own models of education. One example that comes to mind is the Amiskwaciy Academy which has been around for a little more than 2 decades. It is the first urban Indigenous high school in the Western part of Canada. This school was developed in consultation with Indigenous Elders and communities, and its architecture, curriculum and environment reflect Indigenous epistemologies, worldviews and ways of life (Amiskwaciy Academy, 2020). This model of education demonstrates the ways in which the government can honor Treaties and show commitment to Indigenous Education. I had the opportunity to visit Amiskwaciy, and the walls and classroom designs reflect Indigenous ways of knowing, Indigenous ways of teaching and Indigenous ways of learning. This is one example of how Indigenous People continue to exercise their sovereignty as the Original Peoples of these Lands now known as Canada. Other examples include the use of Indigenous languages and land-based education. This is remarkable demonstration of Indigenous sovereignty following the imposition of the destructive Residential Schools.

In another example, a postsecondary institution in Western Canada that is entrenched in Indigenous knowledges and methodology is University nuhelot'ine thaiyots'į nistameyimākanak Blue Quills. This accredited university historically was part of the

residential school system which was designed to disconnect Indigenous People from their culture and identity. Today it is the first Indigenous owned and controlled university in Canada. Its transformation and existence came about through the efforts and leadership of Indigenous peoples to reclaim their education, and in recognition of their sovereignty as Indigenous people who are rooted in their ancestral territories. In a message, Blue Quills former president, L. Makois ([Blue Quills First Nations College, 2002](#), p. v), reasserts the view that “Our belief is that spirituality is the highest form of consciousness. Through its evolution, Blue Quills has walked full circle to return our people to the original teachings of, love, honesty, sharing, and determination.”

At the university, Indigenous culture and teaching philosophies are salient and the university promotes and supports Indigenous pedagogical approaches and identities. These two models of Indigenous education and governance systems focus, and emphasize Indigenous curricula, perspectives and voices. For example, they center local Indigenous languages in the region into their curriculum including Cree and Dene. Elders are crucial to Indigenous teaching and learning and have important roles in the learning environment of these Indigenous institutions. A quick review of courses and programming shows a curriculum that is Indigenous informed, and community based in every subject area. When the curriculum is structured in Indigenous epistemologies and pedagogy, [Shirley \(2017, p. 168\)](#) writes,

It provides youth with opportunities to examine core aspects of their Indigenous identity in addition to acquiring knowledge and skills required for protecting, promoting, and preserving Indigenous people, language, culture, and land. These processes contribute to rigorous academic work that are intellectually engaging and empowering.

Indigenous Education is not static. Indigenous Education too can refer to the ways in which Indigenous People have survived and defy colonizing and assimilative agenda by asserting their sovereign right to educate their children according to their own cultures, languages, and knowledges ([Hopkins, 2020](#), p. 5).

The calls-to-action which resulted from Canada’s Truth and Reconciliation Commission are about understanding and redressing the history and legacy of residential schools. Of the Commission’s 94 calls-to-action under Education and Reconciliation, calls 62 and 63 explicitly state:

We call upon the federal, provincial, and territorial governments, in consultation and collaboration with Survivors, Aboriginal peoples, and educators, to: i. Make age-appropriate curriculum on residential schools, Treaties, and Aboriginal peoples’ historical and contemporary contributions to Canada a mandatory education requirement for Kindergarten to Grade Twelve students.

We call upon the Council of Ministers of Education, Canada to maintain an annual commitment to Aboriginal education issues.

[Truth and Reconciliation Commission of Canada \(2015f, p. 7\).](#)

These are direct calls for Canada to examine and make right its historic wrongs and to end its continued systemic oppression of Indigenous Peoples.

Conclusion

The history of residential schools in Canada is part of a broader history of global colonization and imperialism of Indigenous Peoples and their ancestral territories. The laws and policies which were developed suppressed Indigenous Peoples and their identity ([Truth and Reconciliation Commission of Canada, 2015f](#), p. 133). In fact, the residential schools, the Day Scholars and the federally funded Day schools were all part of the Eurocentric assimilative and genocidal policies.

Indigenous People lived their lives and educated their children just as any other peoples and cultures. They were, and still are today, distinct peoples living, working, and thriving on their Lands prior to colonial governments systemic oppression and targeting of Indigenous culture resulting in genocide. They were subjected to European violence that questioned their validity and viability and threatened their identity and ways of life. The British and Canadian governments introduced and enforced laws and policies which were intended to facilitate the process of aggressive assimilation and systemic abuse engrained in enforced policies and legislations.

Despite these pressures, Indigenous People expressed their self-determination and sovereignty in various ways in response to the attacks on their knowledge systems. The [Assembly of First Nations \(2018, p. 37\)](#) in their learning series Plaintalk 3 stated: “It is a testament to the strength, resilience, will, determination, and power of First Nations peoples that they have survived pressures that can only be described as genocidal”. Schools such as Amiskwaciy and University nuxelhot’ine thaa?ehots’i nistameyimâkanak Blue Quills, and other governance and leadership initiatives and engagements by Indigenous People, big or small, work toward sustaining Indigenous Peoples and their future. [LifeMosaic \(2020\)](#) suggests that these all help to prepare a new generation of connected Indigenous leaders, who are ready and willing to support their Elders, protect Indigenous rights, cultures, and territories, and examine new ways to promote Indigenous knowledge and practices while following in the ways of their ancestors.

Introduction

It is impossible to do justice to the burgeoning field of gender and sexuality studies in education and the extent to which an increasing body of theoretical and empirical knowledge about gender and sexual diversity has come to inform our understandings of sex, sexual orientation, gender identity, gender expression and questions of embodiment. What we provide here is some insight into our own engagement with selected literature as a gesturing toward a mapping of the field that attempts to encapsulate a shift away from an earlier focus in *Lesbian and Gay Studies* with its minoritized focus on sexual identity categories to an embrace of *Queer Studies* with its envisioning of a more universalizing focus on a *radical* sexual politics with heteronormativity in social theory and research as its focus (Butler, 1993a; Gamson, 2000; Rubin, 1984; Sedgwick, 1991; Umphrey, 1995; Warner, 1991). However, we highlight the emerging and vital epistemological significance of *Transgender Studies* and its capacity to inform our understanding of gender identity, *trans* and nonbinary personhood and gender expansiveness in the field of education and specifically the site of schooling, which take us beyond the antinormative limits of queer theory (Kennedy, 2018; Martino and Cumming-Potvin, 2018; Wiegman and Wilson, 2015).

We begin with a review of the significant contribution of large-scale reports on the experiences of gender and sexually diverse (GSD) youth in the school system in their capacity to highlight the systemic barriers related to the impact of homophobia, heteronormativity, transphobia and cisnormativity on the lives of these students. This body of research has functioned to amplify the lived experiences of GSD students in schools with a very important focus on outlining recommendations which have very clear policy and practice implications for fostering gender and sexual diversity in schools, and more specifically supporting GSD students. We proceed by reviewing a selection of qualitative studies, which provide access to the voices and perspectives of GSD students in schools, to draw attention to the onto-epistemological, political and ethical necessity of such a desubjugating focus in educational research that is committed to supporting GSD youth in the education system. Finally, we provide some reflection on queer theory and its limits, while also acknowledging its productive potentialities for the field which, we argue, can only be realized through a more thorough engagement with and commitment to *Transgender Studies* and what it has to offer in terms of a necessary epistemological focus on *trans* bodily ontological accounts of gender personhood (Rubin, 1998; Stryker, 2006).

The experiences of gender and sexually diverse students in schools: large-scale survey studies

The increasing visibility of gender and sexually diverse (GSD) students in schools has illuminated the necessity for greater and more nuanced understanding of the ways in which current systems, policies and programs affect their experiences and perceptions of safety and support. More recently, there has been a growing interest in learning about the experiences of gender diverse students

specifically in schools, which have highlighted the inimical impact of cisgenderism and cisnormativity¹ on these youth (Bartholomaeus and Riggs, 2018; Ferfolja and Ullman, 2021; Kennedy, 2018, 2021; Luecke, 2011; Mangin, 2020; Martino et al., 2020; Riggs and Bartholomaeus, 2018; Sinclair-Palm, 2017). This attention to the experiences of *trans* and gender diverse students is a recent development, given that, as Greytak et al. (2013) have pointed out, historically, the “T” in “LGBT” studies in education has largely been omitted and erased from research that readily employs this acronym. However, a number of large-scale survey studies have included a focus on the experiences of both gender and sexually diverse youth in the school system (Bradlow et al., 2017; Kosciw et al., 2020; Taylor and Peter, 2011; Ullman, 2015). This research has, indeed, contributed to generating knowledge about the lives of GSD students in schools and the extent to which they feel supported. Significantly, only some reports signal the necessity of concomitant considerations of race, ethnicity, disability, social class and their intersections with gender and sexual diversity. However, *collectively*, these reports highlight global north similarities not only about the reality of the lived experiences of GSD students, but in the policy and practice recommendations they support.

In a nation-wide study that involved surveying 3700 students from across Canada through a 54-item questionnaire, Taylor and Peter (2011) sought to contribute to the “lack of a solid Canadian evidence base” regarding the experiences of GSD students, which served as a significant “impediment faced by educators and administrators” who needed to understand “the situation of LGBTQ students in order to respond appropriately and to assure their school communities that homophobic and transphobic bullying are neither rare nor harmless, but are major problems that schools need to address” (p. 14). The report identifies alarming rates of both verbal and physical harassment endured by GSD students. Specifically, “74% of *trans* students, 55% of sexual minority students, and 26% of non-LGBTQ students reported having been verbally harassed about their gender expression,” and when asked about being verbally harassed about their gender identity or sexual orientation daily or weekly, “37% of *trans* students, 32% of female sexual minority students, and 20% of male sexual minority students” (p. 15) reported affirmatively. Such findings highlight that homophobia and transphobia continue to be a pervasive problem in schools.

Unfortunately, these findings are neither exclusive nor confined to the Canadian context, nor are the reported instances of homophobia and transphobia simply an issue of the past. For example, Kosciw et al. (2020) conducted a nation-wide survey involving approximately 16,700 students between the ages of 13 and 21 across the United States, and revealed starkly similar findings to the Canadian context related to instances of verbal and physical harassment experienced by GSD students in schools, nearly a decade after Taylor and Peter’s study. In particular, they highlight that “[m]ore than two-thirds of LGBTQ students (68.7%) were verbally harassed at school in the past year based on their sexual orientation” while, just as alarmingly, “[o]ver half of LGBTQ students (53.7%) were verbally harassed at school in the past year based on their gender” (p. 28). Additionally, these “disturbing and increasing rates of verbal and physical harassment of sexuality and gender diverse students” were also reported in the Australian context (Ullman, 2015, p. 7). In a nation-wide survey comprising of over 700 students between the ages of 14–18 across Australia, Ullman (2014) noted that “45% of participants indicated that they had witnessed school-based physical harassment of classmates perceived to be sexuality and/or gender diverse,” whereas a “startling 94% of students had heard homophobic language at school, with 58% of these young people reporting hearing this language daily” (p. 7). Evidently, the school experiences of GSD students pertaining to homophobia and transphobia are pervasive and reported consistently across Canada, the United States, and Australia.

Further corroborating these experiences on a global north scale, a nationwide survey in the United Kingdom that specifically surveyed over 3700 LGBT young people between the ages of 11–19, found that “nearly half ... (45%—including 64% of *trans* pupils) are bullied for being LGBT at school,” and just over half of “LGBT pupils (52%) hear homophobic language ... and almost half (46%) hear transphobic language ‘frequently’ or ‘often’” (Bradlow et al., 2017, p. 6). These instances of harassment have been shown to exacerbate issues of mental health, as documented by Bradlow et al. (2017) who noted that “rates of poor mental health are alarmingly high among LGBT young people, with *trans* pupils at particular risk” (p. 30). In this respect, Kosciw et al. (2020) underscore the significance of schools having a Gay Straight Alliance (GSA) which has been shown to invite “a greater sense of belonging to the school community and greater psychological well-being among LGBTQ students, perhaps as a result of the overall positive impact of GSAs on the school environment” (p. 147). Taylor and Peter (2011) also noted the importance of GSAs as “safe space[s] in which LGBTQ students and allies can work together on making their schools more welcoming for sexual and gender minority students” (p. 127), and resultantly, students from schools who have GSAs were “much more likely to agree that their school communities are supportive of LGBTQ people compared to participants from schools without GSAs (53.1% vs. 26.4%)” (p. 128). The importance of these clubs and the recommendations for their creation are reiterated in the reports where GSAs exist (i.e., Canada and the United States). Importantly, it is also noted by Kosciw et al. (2020) that there are “benefits to GSA participation for LGBTQ students of color,” (p. 58) though research has suggested that LGBTQ students of color often avoid these spaces as “they do not see their school’s GSAs to be inclusive or useful” (Kosciw et al., 2020, p. 63) or that their identities or lived experiences are represented in GSAs and often find they are “under surveillance by their heterosexual Black peers” (McCready, 2004a, p. 42).

¹Lennon and Mistler (2014) define cisgenderism as “the cultural and systemic ideology that denies, denigrates or pathologizes self-identified gender identities that do not align with assigned gender at birth, as well as resulting behavior, expression and community” (p. 63) while Serano (2016) explains cisnormativity as “the assumption that a person’s assigned birth gender corresponds with a mutually exclusive set of masculine or feminine attributes, aptitudes, abilities, and desires” (p. 4).

Experiences of gender and sexually diverse students of color

Largely, the experiences of GSD students of color are only reflected in some reports (Kosciw et al., 2020; Taylor and Peter, 2011; Truong et al., 2020a,b; Zongrone et al., 2020a,b), while being otherwise overlooked or unaccounted for in others (Bradlow et al., 2017; Ullman, 2015). Importantly, Taylor and Peter (2011) make the distinction regarding the experiences of GSD youth of color, indicating that “Caucasian youth, both LGBTQ and non-LGBTQ, were far less likely to report having been physically harassed or assaulted because of their ethnicity: 8% compared to 13% of Aboriginal youth and 15% of youth of color” (p. 20) underscoring the pervasive reality of the aforementioned “double whammy” (Taylor and Peter, 2011, p. 65). Such an assertion overlaps with Kosciw et al. (2020) who reported that “all LGBTQ youth of color were at greater risk of experiencing multiple forms of victimization than their White LGBTQ peers” (p. 114). In light of these intersections of gender and race, Taylor and Peter (2011) insist that “policy, program, and curriculum development needs to reflect an understanding of how school climate for sexual and gender minority youth is affected by intersecting systems of social power such as racialization and poverty that are at work in all schools” (p. 28).

Similarly, Human Rights Campaign and Gender Spectrum (2018) highlighted the importance of addressing these problematic policies and systems in their report surveying over 5600 gender expansive youth, indicating that “difficulty in finding LGBTQ counselors of color or programs that relate directly to their experiences with gender and race-based discrimination often leads to feelings of isolation and a lack of sense of belonging” (p. 33). Therefore, the report emphasizes the necessity that “youth-serving professionals understand the intersection of race and LGBTQ identities, and the ways in which white supremacy polices the identities, expressions and existences of gender-expansive people of color” (p. 33). In addressing and considering these systemic barriers for *trans* youth of color, the statistics outlined in some of these comprehensive reports on GSD youth can be more purposefully addressed and considered. Speaking to more sweeping changes, every large-scale study “indicates a need to explicitly address gender identity, gender expression, and *anti*-transphobia in school and school board safer schools and equity and inclusive education policies” (Taylor and Peter, 2011, p. 18), signifying the necessity of both the development of GSD inclusive school policies and their enactment with respect to curricular and pedagogical implications.

Curricular and pedagogical implications

Each report highlights the importance of education about gender and sexual diversity which is largely lacking in many schools. For example, Bradlow et al. (2017) reported that “two in five LGBT pupils (40%) are never taught anything about LGBT issues” (p. 22). Meanwhile, Kosciw et al. (2020) found that when GSD content was discussed or referenced, “[o]nly 19.4% of LGBTQ students were taught positive representations of LGBTQ people, history, or events in their schools” (p. xxii). This absence of inclusion of gender and sexual diversity in curriculum is a consistent finding and focus across major reports examining the experiences of GSD youth in schools. Even when there is some measure of GSD-inclusive curriculum, it is often “covered in only one course, which would minimize any impact” and therefore, Taylor and Peter (2011) implore that “LGBTQ matters need to be implemented more widely across subject areas” (p. 125). In this respect, Ullman (2015), in her nationwide report of GSD student experiences in Australia, recommends “[t]raining for school staff which addresses expectations for inclusivity of sexuality and gender diversity and provides guidelines for inclusive language and related resource integration across all areas of the curriculum” (p. 9). However, these opportunities for professional development are scarce and it is often the parents of and/or GSD students who are responsible for driving such initiatives or challenging cisgenderism (Bartholomaeus and Riggs, 2018; Carlile and Paechter, 2018; Ferfolja and Ullman, 2021; Luecke, 2011; Rodela and Tobin, 2017; Slesaransky-Poe et al., 2013; Travers, 2018). As Payne and Smith (2014) indicate, “few professional development opportunities are provided to practicing teachers to gain knowledge about the LGBTQ student experience” (p. 400), and moreover, feel that it is “‘not their role’ to discuss sex, sexuality, and gender with their students” as they view their students as “innocent and asexual” (p. 401; see also DePalma and Atkinson, 2006).

As such, Truong et al. (2020a) highlight that a school curriculum which is “inclusive of diverse identities” may contribute to “instill[ing] beliefs in the intrinsic values of all individuals” (p. 32) thereby accounting for the fact that “Black LGBTQ students have unique school experiences, at the intersection of their various identities, including race, gender, and sexual orientation” (p. xx). Such inclusivity is particularly significant given that “LGBTQ students of color (including Black, AAPI, Latinx, Native and Indigenous, MENA, and multiracial LGBTQ students) commonly experienced both racist and *anti*-LGBTQ victimization at school” (Kosciw et al., 2020, p. 146). This intersectional compounding victimization is referred to by Taylor and Peter (2011) in their report as a “double whammy” where GSD students of color are “not only being physically harassed or assaulted because of reasons related to gender or sexual orientation, or both, but they are also much more likely to be physically harassed or assaulted because of their ethnicity” (p. 65). In fact, Kosciw et al. (2020) insist that “school staff must support LGBTQ youth of color with an intersectional approach that acknowledges and responds to racism, homophobia, and transphobia, and to the ways these interconnected forms of oppression may influence one another” (p. 114). To achieve this, Taylor and Peter (2011) recommend that: “Faculty of Education integrate LGBTQ-inclusive teaching and intersectionality into compulsory courses ... so that teachers have adequate opportunities to develop competence before entering the field” (p. 140) and therefore, can more effectively provide positive representation and considerations in their pedagogy, especially when considering the experiences of GSD students of color. Intertwined with such recommendations are also other policy and practice implications which these studies also highlight as necessary.

Policy and practice implications

Kosciw et al. (2020) underscore “important benefits associated with both comprehensive *anti*-bullying/harassment policies, as well as policies affirming the rights of transgender and nonbinary students” (p. 147). In addition, Bradlow et al. (2017) also note that schools should “have clear and widely promoted policies and procedures preventing and tackling homophobic, biphobic and transphobic bullying and language” (p. 38). This advocacy for GSD-inclusive policies and ensuring that they are understood by students and staff is especially significant, as Ullman (2015) notes, given that “sexuality and gender diverse students who are aware of inclusive policy are more likely to feel safe and less likely to report school-based victimization related to their sexuality and/or gender diversity” (p. 34; see also Kull et al., 2015). Of course, given the identity vectors that only heighten experiences of victimization for GSD students of color, Taylor and Peter (2011) insist upon not just “*anti*-homophobia, *anti*-biphobia, and *anti*-transphobia [but also] intersectionality measures in safer schools policies and programs” in order “to provide institutional authority and leadership” (p. 139).

Taylor and Peter (2011), specifically emphasize the significance of *intersectional* considerations in policy (as well as curricular) development and enactment. Such considerations are significant given that the creation of *anti*-discrimination legislation often only considers “the least marginalized of the marginalized,” while omitting “a person who faces intersecting vectors of harm [who] would be unlikely to benefit from *anti*-discrimination law” (Spade, 2015, p. 44). It is for this reason that Spade (2015) advocates for a *critical trans politics* that moves beyond an “individual framing of discrimination and ‘hate violence’ and [to] think more broadly about how gender categories are enforced on all people in ways that have particularly dangerous outcomes for *trans* people” (p. 9). Policy creation often “permits—and even necessitates—that efforts for inclusion in the discrimination regime rely on rhetoric that affirms the legitimacy and fairness of the status quo” (Spade, 2015, p. 44), and therefore, Taylor and Peter’s (2011) insistence for an intersectional approach is significant.

Beyond policy considerations, there are common recommendations across the reports for ensuring that leadership (e.g., administrators, department heads, etc.) “send out a strong message to all pupils and staff that homophobic, biphobic and transphobic bullying and language is not acceptable” (Bradlow et al., 2017, p. 38). Moreover, Kosciw et al. (2020) affirm the importance of supportive educators who evidently positively influence “students’ academic performance, educational aspirations, feelings of safety, school absenteeism (missing fewer days of school), psychological well-being, and connection to their school community” (p. 147). In procuring such supportive staff, Taylor and Peter (2011) advocate for “professional development opportunities to assist schools in the implementation of LGBTQ-inclusive and intersectionality curriculum” (p. 140). However, Payne and Smith (2014) have indicated that these opportunities are rarely provided to educators, which ultimately limits the capacity for teachers to recognize and achieve what Ullman’s (2015) report advocates for, which is “establish[ing] a classroom climate where sexuality and gender diverse students feel safe to advocate for curricular inclusions and to report marginalization from peers or adults in the school” (p. 42). In the following section, we turn our attention to qualitative studies which allow for more particularized and detailed insights into the perspectives and lived experiences of GSD students in schools.

Desubjugated voices of gender and sexually diverse students in schools: small-scale qualitative studies

GSD people in general have long been marginalized, *subjugated* and marked as unqualified knowers of their experience (Namaste, 2000; Stryker, 2006). Children and youth, particularly, are often subjugated due to the belief among some medical practitioners that an individual’s age determines what they can and cannot know about their own sexual or gender identity (Pyne, 2014). To seek out and center the voices of GSD students in research, then, is to provide an opportunity for “desubjugating previously marginalized forms of knowledge about gendered subjectivity and sexed embodiment” and thus ascribe rightful value to “the kind of knowledge that transgender people, whether academically trained or not, have of their own embodied experience, and of their relationships to the discourses and institutions that act upon them” (Stryker, 2006, p. 13). Youth-centered, qualitative inquiries add to a growing body of empirical work which helps us better understand the local-level implications of the themes proposed by the large-scale studies reviewed above (Porta et al., 2017), presenting an ever-growing set of recommendations that can better address the issues that impact on GSD students in the school system (Earnshaw et al., 2020; McGlashan and Fitzpatrick, 2017; Snapp et al., 2015; Wilson and Cariola, 2019).

More importantly, qualitative studies often provide more in-depth, particularized knowledge and specificity in detailing the perspectives of GSD students in schools, which further enhance and enrich our understanding of their lived experiences in these institutions, revealing complexities and nuances related to struggle and resistance that are not reflected in larger scale survey research. In this section, we explore two major themes, *knowledge* and *safety*, that are taken up by researchers in qualitative, youth-centered studies which focus on the experiences of GSD youth in schools. The sampling of studies reviewed in the following section are not exhaustive; they illustrate the ways in which knowledge and safety are conceptualized and mobilized by youth, including foci on youth of color, and bring to light the critical role of GSD youth in changing their contexts through advocacy work. Additionally, these studies also raise important questions about the limitations of adult-driven research that presents GSD youth as objects of inquiry vs. collaborators or co-creators.

Knowing and being known

Knowledge is often discussed as formal, (e.g., curricular inclusion, representation, and omission particularly, sexual health and social sciences curriculum), and informal (e.g., alternative educational spaces such as Pride or Rainbow clubs) (Gowen and Wings-Yanez, 2014; Snapp et al., 2015). Qualitative research demonstrates that the availability of formal knowledge in schools where GSD people are represented is inconsistent, at best, and that representation alone does not guarantee the accuracy of the information presented. More often than not, students report missed opportunities for representation (Gowen and Wings-Yanez, 2014; Ullman, 2014). Youth participants clearly indicate that, when faced with limited curricular representation, students consistently act with agency and request inclusion. Youth from a California study (Snapp et al., 2015) confirm that, although GSD was present in some social sciences and health classes, the information they received was superficial and incomplete, such as the exclusive inclusion of gay men in sexual health. These youth also reveal that teachers often ignore their repeated requests, despite students directing educators to specific curricular connections between GSD history, contemporary issues and class content. Importantly, these perspectives illuminate youth agency at work. In response to academic erasure, GSD students take it upon themselves to educate teachers about their legal duties under California's FAIR Education Act, and they create alternative learning spaces to discuss the pertinent issues that are overlooked in formal learning space (Snapp et al., 2015). One student in this study actively mentored an educator in creating inclusive class content that can be drawn on by other history teachers in the school (Snapp et al., 2015). In the face of erasure, youth employ a variety of tactics from "pushing the issue" (Ullman, 2014, p. 436), that is to say, confronting the educator about their silence or omission, to intentionally remaining silent because of the implicit understanding that any attempt to draw attention to GSD issues would be dismissed (Gowen and Wings-Yanez, 2014). It is widely noted that youth-led knowledge mobilization often migrates from the classroom to alternative learning spaces, such as Pride clubs or even to hallways for informal conversations with teachers outside of formal instructional time (Gowen and Wings-Yanez, 2014; Ullman, 2014).

The common thread that connects these experiences and responses is that youth are keenly aware of when their identities are being erased, but also of the power dynamics at play. In each instance they weigh the trade-off between troubling erasure and the subsequent imposition on them to act as educator with exposure and possibly opening themselves up to further alienation. GSD youth exist in a paradox where their erasure from curriculum is a major detriment to their academic engagement, and their visibility—a result of requesting inclusion and representation—also makes them vulnerable to further discrimination (Ullman, 2014). Youth advocates who take on the task of educating their educators exemplify the fact that, more than being experts of their own experience, (let alone being called on to be experts full stop on the experiences of GSD students in general), youth knowledge extends beyond simple curricular inclusion to knowledge about the power dynamics at work in school systems that help them navigate relations with staff, and astute critical thinking that allows them to elegantly maneuver GSD content into formal and informal educational contexts. However, scholars such as Frohard-Dourlent (2018) point to the limitations of student led change, especially when *trans* students are placed in the driving seat of such educational advocacy work in their demand for recognition without the provision of the necessary resources needed. They argue that "[e]mphasising self-determination and putting responsibility on individual students and their families to adapt to or change educational contexts obscures the (re)production of gendered, racialized and classed inequalities" and that "this process may create situations where educators are absolved from challenging institutional and cultural marginalization of gender diversity, and from their role as potential failures" (p. 338).

Safety

As previously established, *safety* is conceptualized broadly as a physical and psychological well-being, and the violence that GSD students face is subsumed under the umbrella of "bullying" (Earnshaw et al., 2020; Kosciw et al., 2020; Taylor and Peter, 2011). Youth voice represented in qualitative research extends this generalized understanding of *safety* by offering a more nuanced exploration of how GSD students conceptualize safe and unsafe environments. Additionally, their observations highlight the relationship between knowledge and safety and illuminate the critical role of student-driven advocacy in youth defining and ensuring their own safety at school.

Bathrooms are the focus of research that investigates the absence of safety, the very real presence of danger, and the implications of this reality on the experience of school for GSD students (Earnshaw et al., 2020; McGlashan and Fitzpatrick, 2017; Porta et al., 2017). Youth highlight that physical and verbal harassment are only one facet of what make school bathrooms unsafe for them. GSD youth from a study by Porta et al. (2017) reveal that the indirect and anticipated violence in bathroom spaces equally impacts on their well-being. In this study, youth share first and second-hand accounts of their experience with school bathrooms and through their testimonial, demonstrate how simply *knowing* of potential for violence in these spaces erodes their sense of safety. It should be noted that the "bathroom challenges" that youth describe occur on multiple levels (Porta et al., 2017, p. 110). In addition to overt acts of violence such as being forcibly removed from the space, they also report more insidious forms of epistemic violence (see Fricker, 2007; Hookway, 2010) in which their presence in sex-segregated bathrooms is policed by other occupants who assume the youth is in the "wrong" space based on their gender presentation. The potential for having one's gender policed and being made to justify one's existence is detrimental to a students' overall sense of well-being at school (Porta et al., 2017). Violence related to bathrooms also occurs via the absence of knowledge as is the case for one participant showcased in

Porta et al. (2017) work: with no information available about bathroom options, the participant is forced to out themselves at the school office in order to find out what facilities are available to them. This incident was framed as a “positive experience” by researchers because the student was eventually granted access to a staff washroom, though this representation minimizes the fact that no information about alternative washroom spaces was readily available.

A school climate cannot be deemed safe if students are required to make themselves intelligible to staff in order to access information about something so basic as bathroom use protocol (see Martino et al., 2020). Interestingly, where the schools appear to work reactively as opposed to proactively to support GSD youth (Earnshaw et al., 2020; McGlashan and Fitzpatrick, 2017; Porta et al., 2017; Ullman, 2014), youth seize on this opportunity to mobilize knowledge for the benefit of their GSD peers, and demonstrate how youth advocacy is at the heart of changes in school climate and safety. Returning to Porta et al. (2017), youth express that a gender-neutral bathroom only contributes to a safer school climate if the student body knows that it exists, and if they feel comfortable enough to access it. One student reported taking on the labor of raising awareness about this space and ensuring that it be welcoming for all students by ensuring supplies such as menstrual products and condoms are available there (Porta et al., 2017). Youth perspectives with respect to school bathrooms broaden the understanding of how safety and danger manifest and emphasize that the gaps in knowledge about GSD folk must be filled in order for school climates to shift (Ullman, 2014). Such studies also provide much more particularized knowledge about student agency and illuminate the capacity of GSD youth as leaders and advocates in bringing about necessary change. However, while these studies highlight that GSD students are not simply “docile bodies” (Foucault, 1977); they also unwittingly point to the failure of schools and educators to take responsibility for actively creating the necessary conditions for supporting the safety and well-being of GSD students in the first place (Frohard-Dourlent, 2018).

Indeed, the advocacy work required for the creation of gender-neutral spaces often falls to student-led clubs such as Gay Straight/Queer Straight, Gender and Sexuality Alliances (GSAs), and the presence of these student groups in schools have been identified in the research as a benchmark for measuring safety in schools for GSD youth (McGlashan and Fitzpatrick, 2017, 2018; Porta et al., 2017). The presence of a GSA in and of itself, however, does not indicate a ubiquitous increase in safety for club members. In an example from New Zealand (McGlashan and Fitzpatrick, 2018), youth participants who are members of their school’s Rainbow club situate their safety in the realm of cultural intelligibility at the intersection of transness and Paskifika culture and ethnicity, stating that what made them feel valued at school is “... like, we have each other. There’s someone else that is like you and they are going through what you’re going through, like the same, so we can relate” (McGlashan and Fitzpatrick, 2018, p. 10). For these two youth, safety within their Rainbow club is connected to their sense of solidarity through shared experience of gender, culture, and ethnicity and they report feeling more secure in their identities as a result of coming together in these spaces. The prerequisite for the safety to explore and express oneself here, is as the authors put it, cultural intelligibility: as these students reported, the potential for self-knowledge, discovery, and expression is amplified when they feel their experience validated by their “sister” (p. 10). The GSA itself is not the locus for safety, but rather a vehicle by which students can find safety in each other and a space which provides an opportunity for cultural intelligibility.

Such studies which provide the perspectives of GSD youth safety are essential to uncovering what specific change is needed in particular school contexts and at the local level. Youth accounts make clear that *safety* is far more complex than a matter of bathrooms, clubs, or name-calling; it is embedded in every aspect of school life and cannot be measured only by the presence of gender-neutral spaces or the absence of reports of physical harm (Earnshaw et al., 2020). The safety of GSD students must also take into account how intersectional identities are being affirmed, how knowledge is being mobilized, and how the responsibility for this labor is divided between staff and students.

Toward desubjugation

These studies highlight the need for a commitment to a desubjugation of GSD student voices in the education system in terms of their capacity to deepen and extend our understanding of the lived experiences of gender and sexual diversity in schools. In fact, such studies have the capacity to counter dominant narratives of victimization and docility which have come to define the experiences of these students (Rasmussen et al., 2004). Given the systemic erasure, pathologization and disenfranchisement of GSD people of which there is a long history (Gamson, 2000; Kuhl, 2019; Namaste, 2000), it is vital to create spaces for GSD youth to voice their own experiences and expertise which is not often acknowledged or actively sought out in schools. Such research creates the possibility for generating counter-narratives. Here, we borrow from Stryker’s conceptualization of desubjugation who proposes a *renarration* by which the “considerable intellectual heritage” of GSD communities, a knowledge born of lived experience speaks back normative narratives that have been established by “legitimate” knowers, such as those from academia and the education system. Though employed with the purpose of advancing *Transgender Studies* as a field, Stryker’s (2006) arguments for the desubjugation of marginalized voices can certainly be applied to learning from GSD youth specifically. Subjugation comes in the form of prioritizing adult voice over that of youth—a power dynamic which invariably is performed in schools and which also is replicated through research, even if that research focuses on youth.

In a number of studies in the field, GSD youth repeatedly assert that adults play a pivotal role in terms of impacting their lives at school, and yet school staff are consistently described as being disconnected from the reality of GSD students in their care and, in fact, have been identified as failing to support or “disinclined to intervene” (Taylor and Peter, 2011, p. 107) on their behalf, and “nearly half [of surveyed students] reported that staff never intervened” when hearing homophobic or transphobic remarks (Kosciw et al., 2020, p. 23; see also Allen et al., 2020; Earnshaw et al., 2020; Gowen and Wings-Yanez, 2014; McGlashan and Fitzpatrick,

2017, 2018; Sinclair-Palm, 2017; Taylor and Peter, 2011; Wyss, 2004; Youth Gender Action Project). Whether, as Earnshaw et al. (2020) report, staff are oblivious to the violence that GSD face, or as reported by McGlashan and Fitzpatrick (2017, 2018), well-meaning educators impose their own anxieties about GSD visibility on the youth they support, consequentially muting student initiatives to assert their identities in public spaces, adults are not attuned to their needs. If desubjugation entails recognizing previously disqualified knowers, in this case GSD youth, as legitimate and valuable knowers, then the power dynamics between educator and student must be re-examined, a hard lesson in humility that the former are not always willing to learn (see Frohard-Dourlent, 2018; Sinclair-Palm, 2017). Educators have at their disposal young people who are eager to share their perspectives, but youth must feel supported in this endeavor (Gowan and Wings-Yanes, 2014; Snapp et al., 2015, see also Schmitz et al., 2019). The labor that youth have been undertaking might undergo a desubjugation: as youth report, the educational work they do to ensure representation is marked as subjugated by virtue of being an extracurricular club activity.

In addition to educators learning from youth participants, researchers must also reflect on what it means to facilitate and enact desubjugation. Research that centers youth voice does not necessarily include GSD youth in meaningful ways throughout the research design process. Discussions that impact on GSD young people are quite often led by cisgender, heterosexual, adults (see Porta et al., 2017). As such, in a field that is predominantly adult-centered, it is adult-designated questions that form the basis for inquiries of all scales. This is not to criticize the work that has been done up until now, but rather to ask, if the ethical and politically exigent goal is desubjugating youth voices, then what do we stand to gain by integrating them more meaningfully into the fabric of research that ultimately impacts directly on their lives? This sample of research shows that GSD youth are answering adult-generated questions with insight that is invaluable, however it cannot be taken for granted that the questions they are being asked are the most relevant to their current reality. Youth have voice, knowledge, agency, regardless of whether “legitimate” knowers from academia and the education system grant them audience or not. There is further work to be done to excavate how participatory-oriented research can transform into youth-led research that is concerned to address fundamental and vital questions of testimonial and epistemic justice (Fricker, 2007).

The observations and contributions of GSD youth to research thus far have demonstrated that GSD youth have, beyond a shred of a doubt, the capacity to collaborate in more meaningful ways. As such these studies have not only provided invaluable knowledge about the many ways in which GSD youth themselves (and often supportive parents) are in the driving seat in terms of ensuring their safety in schools (Ferfolja and Ulman, 2021), but also illuminates their leadership role in educating adults and mobilizing knowledge about GSD issues among themselves. In this sense, the question of both GSD student agency, as well as the need the school system to take responsibility for educating about cisgenderism and *trans* inclusion is highlighted (Martino et al., 2020). As such, this youth centered research not only troubles how GSD youth are currently positioned in schools, but raises important methodological considerations about the need for more participatory modes of research. Such approaches move beyond GSD youth merely being produced as objects in connecting educational research to enacting social justice in generating knowledge that is committed to ensuring testimonial as well as epistemic and hermeneutic justice (Fricker, 2007; Lather, 1991; Smith, 1996).

The epistemological implications of queer and transgender studies in education

In reviewing and engaging with some of the significant research, what is highlighted are not only important methodological considerations in generating knowledge about GSD youth in the school system, but epistemological and theoretical questions pertaining to the framing and construction of knowledge about gender and sexual diversity. For example, the significance and contribution of queer theoretical perspectives in the field cannot be denied. Scholars in education have been inspired by Foucauldian and Butlerian insights into dominant systems of heteronormativity and heterosocialization with implications for shifting the analytic focus away from an exclusive focus on the sexual minority subject per se to a more universalizing critique of the mechanisms of *privileging* and *othering* (Kumashiro, 2002) at the heart of normalizing heterosexuality (Sedgwick, 1991, 1993/1999; Foucault, 1990; Butler 1993a). DePalma and Akinson's (2009) and Epstein and Johnson's scholarship in the United Kingdom, as well as that of Rasmussen (2006a) in Australia and Letts and Sears (1999) and Pinar (1998) in the United States are just a few representative collections that provide queerly informed insights into the schooling of sexualities.

Foucault's (1977) analytics of power, particularly in terms of how it informs our understanding of the regulatory and systemic ways in which knowledge of bodies and sex are “put into discourse” (Foucault, 1990, p. 10) with specific biopolitical effects for understanding gender and sexual normativity and diversity in schools, has had a significant impact on generating an important *body of knowledge* about gender and sexual identity that ruptures, and challenges what Britzman (1998) refers to as an “orientation to normalcy as the pernicious production of such binaries as self/other” (p. 82). Butler's (1993b) conceptualization of the *heterosexual matrix*, along with her focus on the compulsory iteration of gender norms which “operate by requiring the embodiment of certain ideals of femininity and masculinity” has indeed informed much queer educational research that has been committed to the “subversion of the norm” with respect challenging hegemonic modes of heterosocialization and gender normalization in schools (p. 22; see also Ingrey, 2013; Rasmussen, 2001, 2006b). Pinar's (1998) *Queer Theory in Education*, along with Britzman's (1995) “Is there a queer pedagogy or stop thinking straight” in our view encapsulate foundational work in education which translated the pedagogical significance of queer theory in the field of education. This body of work is also representative with respect to understanding the logics of antinormativity (Wiegman and Wilson, 2015) as a defining feature of queer theoretical frameworks and their critical application in the field of education with respect to persistent calls to expose and interrupt heteronormativity and its problematic institutionalization in schools (Ferfolja, 2007; Blackburn, 2007; Goldstein et al., 2007).

However, scholars such as McCready (2004a,b) have drawn attention to the need for more intersectional analytic approaches by centering the voices of queer youth of color thereby exposing the limits of the whiteness of queer studies and its analytic focus and erasure of race (Logie and Rwigema, 2014). Bartone (2019), for example, argues that “it is vital for all educators to consider how racism and heteronormativity influence their pedagogy, the classroom and school environment, and the educative experiences of their students” (p. 99). His research on the intersections of race and sexuality in the schooling experiences of black queer youth speaks to the epistemological and political significance of employing both critical race and queer theories—what he identifies as *quare theory* and which according to Johnson (2001) provides a basis for analysis in which “the discursive process of mediated identification and subjectivity in a political praxis [that] speaks to the material existence of “colored bodies” (cited in Bartone, p. 99).

In more recent times a body of growing research in education has emerged which has focused on the experiences of transgender, nonbinary and gender diverse youth in schools. This literature has highlighted vital issues and questions pertaining to the barriers and failure of schools to adequately support *trans* students and to educate about gender identity and gender diversity (Ferfolja and Ullman, 2020; Frohard-Dourlent, 2016, 2018; Sinclair-Palm and Gilbert, 2018; Payne and Smith, 2014; Luecke, 2018; Mangin, 2020; Martino et al., 2020; Morgan and Taylor, 2019; Riggs and Bartholomaeus, 2018; Rodela and Tobin, 2017; Ullman, 2014). However, Martino and Cumming-Potvin (2018) advocate for a much greater engagement with *trans* studies’ epistemological accounts of gender identity, selfhood and embodiment in the field of education, which we agree is central to a *critical trans politics* that is committed to *trans* desubjugation (Spade, 2015; Stryker, 2006). Such an epistemological focus requires a shift away from focusing on heteronormativity to an emphasis on what Kennedy (2018) refers to as “cultural cisgenderism” which refers to “a systematic erasure and problematizing of *trans* people and the distinction between *trans* and cisgender people [which] ... essentializes sex/gender as biologically determined, fixed at birth, immutable and externally imposed on the individual” (p. 308). In this sense, there are some limits to the capacity of queer theory to account for the complexities of embodied experiences of gender diverse people which *trans* scholars themselves have pointed out and which have often resulted in a problematic construction of *trans* people who embrace a more stable gender identity category as “gender defenders,” while those who counter gender norms are read as “gender outlaws,” thereby devaluing the former by casting them in essentialist terms as merely “conforming to the rules of gender [that the latter have] otherwise transgressed” (Elliot and Roen, 1998, p. 238; Keegan, 2020).

Such a position epitomizes the antinormative limits of queer theory in its capacity to account in phenomenological terms for the bodily ontological experiences of many *trans* people which *trans* scholars such as Rubin (1998) have railed against. He argues “that ‘queer’ signifies one condition for articulating a radical *trans* agenda [which] also represents an opportunity for the appropriation of transsexuals by nontranssexuals ... our lives have been appropriated to demonstrate the theories of gender performativity but only to the extent that they fail to reproduce the normative correspondence between body morphology and gender identity assumed as a matter of course by nontranssexuals” (p. 276). This critique has been extended by *trans* scholars such as Bettcher (2013) who points out that *trans* individuals who self-identify as men or women are “every bit as resistant as those who do not,” and that such “deployments of identity categories ... involve radical departures from dominant practices of gender and, hence, an alteration of the meaning of terms such as ‘woman’ and ‘man’” (p. 403). In this capacity, *trans* scholars have identified the limits of queer theory and its potential for enacting hermeneutic and epistemic injustice (Fricker, 2007) in its imposition of an antinormative logic which has consequences with respect to delegitimizing and failing to properly understand the bodily ontological experiences of *trans* men and women and their gender identities (see Kaufmann, 2010 as an example). Our reading of *trans* scholarly literature and engagement with *Trans Studies* specifically highlights that there is indeed a need for a more critical interrogation of queer theory in the field of Education and, hence, an epistemological commitment to embracing *trans*-informed analytic frameworks which center a critical focus on cisgenderism as a basis for understanding the terms of an ethical commitment to *trans* desubjugation.

Conclusion

In this article we have provided some critical insights into research on gender and sexuality in education though with a caveat that what we offer is limited, serving only as a snapshot of sorts from of our own various and situated standpoints from within the field. An overview of large-scale survey studies from Australia, North America and the United Kingdom have been useful in providing knowledge about the lived experiences of GSD students in schools and identifying significant barriers with specific implications for reform in the education system in the Global North, both with respect to ensuring safety for all students and, pedagogically, in terms of highlighting the need for queer and *trans* supportive curricula and affirmative spaces (Cavanaugh, 2016; Martino and Cumming-Potvin, 2016, 2019; Omercajic and Martino, 2020; Martino et al., 2021; Lapointe et al., 2017). However, we highlight the contribution of qualitative studies in education which amplify and center the desubjugated voices of queer and *trans* youth in schools with their potential for offering further nuanced analysis and particularized insights into the lived experiences of GSD students and their agency. In engaging with selected research, we highlight the need for studies that pay particular further methodological attention to participatory approaches to knowledge generation in thinking through important questions of testimonial, hermeneutic and epistemic justice in supporting the ethico-political project of desubjugation of queer and *trans* youth in the education system. We also provide some critical insights into the epistemological necessity of the need for further sustained engagement with *trans* studies’ theoretical scholarship which has highlighted the antinormative limits of queer theory.

Acknowledgment

Introduction

What does it mean to be a refugee? Of course, the meaning of a “refugee” has been defined and protected in international law. It was, in fact, some 70 years ago, in Geneva, that the Convention Relating to the Status of Refugees first officially defined a “refugee” as a person who has left their country of origin due to a “well-founded fear of being persecuted for reasons of race, religion, nationality, membership of a particular social group or political opinion” (UN General Assembly, 1951). Immediately, there are points of exclusion here. What, for example, of those persons who find themselves persecuted for reasons of sexuality? And if we drill down more precisely into the terms that frame this definition, then it becomes apparent, as Carens (2003, p. 102) notes, that there is hardly one that is not “subject to interpretation and contestation.” Equally, to be a refugee is to be among the 82.4 million people who, by the end of 2020, had been forced to flee from the places that had once been their homes (UNHCR, 2021). More precisely, it is to be among the 20.7 million persons from across the world who, by the end of the same year, were (under the mandate of the UN High Commissioner for Refugees) counted as refugees (UNHCR, 2021).

But beyond the statistics, and the label itself, how is its meaning experienced by those uprooted persons who, granted refuge in some foreign land, come to be named “refugees”? Hannah Arendt, in her intensely incisive essay, “We Refugees,” observes that Jews, fleeing Nazi persecution, “don’t like to be called ‘refugees’, and so call each other ‘newcomers’ or ‘immigrants’” (Arendt, 2007a, p. 264). While Viet Thanh Nguyen, who, in 1975, came with his family to the US as child refugee from Vietnam, insists on being “called a refugee” despite the fact that it would be “easier” for him to be known as “an immigrant, to pass ... as belonging to a category of migratory humanity that is less controversial, less demanding, and less threatening than the refugee” (2018, p. 11). Vu Tran, who was also forced to flee from Vietnam as a young child, before finding refuge, along with his mother and sister, in the US, recalls that when he was younger he saw himself as an “immigrant,” since a “refugee felt like a thing of the past, a provisional status ... that suggested vulnerability, inferiority, alienness—everything I wanted to remove from my idea of myself” (original emphasis, 2018, p. 151). Alongside these tensions, there is, of course, further complexity here, since it is better to be defined as a refugee than an asylum-seeker, an asylum-seeker being a person who has yet to be conferred the status of refugee (UN High Commissioner for Refugees, 2006).

What is clear, however, is the fact that whether a person comes to be categorized as an immigrant, an asylum-seeker, or a refugee, there are real consequences for both their social and personal identity. And it is precisely to the question of identity that this chapter attends as it examines the exclusion, along with possibilities for the inclusion, of refugee students. Hostility to immigrants and refugees, as it is manifested in images and slogans that permeate social media, in endless degrading newspaper headlines, and in the discourse of politicians who seek to drum up votes by stirring up fear, distorts perceptions of these students’ identities. But, more than this, such hostility can diminish the very capacity of these students to create identities that disclose their individual distinctiveness.

This chapter opens by turning to Goffman’s (1990a) account of stigma to illustrate the social dimensions of refugee student exclusion. The chapter then examines the critical connection between assimilation and identity formation in the lives of refugee students. Here the chapter argues that as refugee students attempt to fit into preestablished ways of acting, speaking and appearing, so they engage in *identity performances* with the aim of proving to their audiences that they have been thoroughly assimilated.

The chapter concludes by turning to the work of Maxine Greene to examine what it might mean to create educational spaces where uprooted and displaced young people can come to create and divulge their distinctive identities.

Otherization and the identities of refugee students

In his distinct conception of stigma, the American sociologist, Goffman (1990a), illuminates the complex web of social interactions that condition our expectations of others. Indeed, Goffman (1990a) suggests that we rarely encounter another person for the first time with hands that are entirely open, and with gazes that are wholly attentive, to the distinctiveness of the stranger's words, deeds, and appearance. Goffman's insights into stigma contains two quite distinct, but equally significant, implications for our understanding of the exclusion of refugee student identities. First, they suggest that if we are to fully appreciate the reduction and exclusion of these students' identities, then before we attend to their individual attributes, we should first examine ruling social attitudes and prejudices. Second, they reveal the ways social attitudes can diminish the ways refugee students might come to understand and, critically, forge their identities.

Stigma and social attitudes

Goffman (1990a, p. 12) observes that each of us carries within us a set of "anticipations," which are often transformed into "normative expectations," and then into "righteously presented demands." However, we are often quite unaware of what these demands are, unaware perhaps even of the very fact that we possess them. In fact, it is not until a stranger enters into our midst who does not fit the social stereotype that we are poised to project onto them, that a distance can open between this anticipated identity (or what Goffman names a "virtual social identity") and this person's "actual social identity" (1990a, 12). Here what we expected (often without our ever being consciously aware of this expectation) is disrupted by reality. This is the moment of stigma, the moment at which we realize that another person has "an undesired differentness from what we had anticipated" (Goffman, 1990a, p. 15). Thus, before we can begin to examine stigmas, "a language of relationships, not attributes, is really needed" (Goffman, 1990a, p. 13). In other words, stigma occurs, not because of some difference or characteristic that emphatically marks out the stigmatized person from others, but because a tension has emerged between our expectations and our experience (Goffman, 1990a; Uba and Nwoga, 2016). Stigma, in short, is a social and not merely an individual issue.

Goffman's understanding of the social dimensions of stigma thus directs our attention to the ways *all* of us might, at any given time, be harboring a whole host of delimiting social expectations. Immediately, this alerts us to our responsibility to awaken ourselves and others to the hostile attitudes and prejudices we might be unreflectively nursing. In relation to the stigmatization and exclusion of refugee students, this entails avoiding a merely individualized approach to their education. In particular, it involves examining how social relations in and beyond our schools can leave persons alienated from each other, their interactions mediated through predetermined and prescribed social prejudices or stereotypes. This, in turn, involves addressing the ways practices, values, and cultures in a school can ameliorate or compound the trauma that these students may experience, and support or hinder them as they begin to articulate themselves in a language that might be entirely new to them.

Stigma and refugee student identity

Goffman tells us that a person's shifting sense of identity and self-worth forms a kind of "moral career," the dimensions of which are shaped by how they are perceived by others (1990a, p. 45). In a particularly telling example, Goffman describes the unfolding of a boy's "moral career" as he moves from a mainstream to a special school. Goffman observes that this child's self-conception will alter, that he will have to accept "the view which the public at large takes of him," as he comes to "learn that the own he thought he possessed was the wrong one, and that this lesser own is really his" (1990a, p. 47). Further insight is offered by the cultural theorist, Stuart Hall, who wrote in 1959 of how children in the UK. were separated from their peers by an examination they undertook at aged 11. This examination determined if these children were to attend a Secondary Modern, and not a Grammar School. Hall reflected that by the time they reach the age of 13 or 14, children attending Secondary Moderns, "begin to reflect upon their own sense of failure" (p. 18). Hall explains that these children, acutely aware of "their second-class status," along with their teachers' "lack of sympathy and understanding," ultimately "become ... what many teachers have always believed they were: unteachable, unclubbable" (1959, p. 18). What Goffman and Hall convey here is the fragility of so many identities, the way they are constantly susceptible to the fluctuating attitudes and judgments of those around them. As Hall notes, "identities actually come from outside, they are the way in which we are recognized and then come to step into the place of the recognitions which others give us" (1995, p. 8).

Drawing directly on Goffman's understanding of stigma, Eren and Çavuşoğlu (2021, p. 16) offer an account of the ways Syrian students in Turkish schools can be designated to "the role of outsiders in their mainstream classrooms." While refugee writers have reflected on their own experiences of being stigmatized and marginalized during their school days. Dina Nayeri, for example, in her memoir, *The Ungrateful Refugee*, writes of her escape from Iran as a child, before finally finding refuge in America. Nayeri tells the story of how, far ahead of the rest of her mathematics group in her Oklahoma school, she took out her sewing kit so she might engage in a more productive activity. Nayeri's teacher asked her to stop sewing, and then said: "In this country, girls have to learn

math just like boys" (Nayeri, 2020, p. 203). On another occasion, when a piece of a papier-mâché map she was constructing broke off, one of Nayeri's teachers said to her: "Don't be lazy. We work hard here, do you understand" (2020, p. 198). The writer, Reyna Grande, describes how she, having been abandoned by her father and then her mother, became, at the age of nine, "an 'illegal' human being," when she crossed the Mexico-U.S. border on the back of her father who had returned for her (2018, p. 73). Grande recalls that her schooling in the US was "almost as traumatic as being abandoned" by her parents, since it saw her "put at a corner table and ignored" (2018, p. 78). Left alone, and feeling "voiceless," Grande reflects that she was "on the outside looking in, marginalized, excluded, 'othered'" (2018, p. 78). The stigmatization of the Syrian students observed by Eren and Çavuşoğlu (2021), along with Nayeri and Grande's lived experience of stigma tell us nothing about the "actual identities" of refugees and much about the unexamined prejudices and stereotypes that permeate societies and influence social attitudes. Indeed, these experiences stream from and confirm over and over again the same inescapable hostility, the same unending refusal to welcome refugees, the fact that they "are mostly unwanted where they fled from; unwanted where they are, in refugee camps; and unwanted where they want to go" (Nguyen, 2018, p. 17).

The otherization of immigrant and refugee students can, however, occur in more subtle and ambiguous ways. As a young man, Stewart Hall was a supply teacher in a school in London. He soon became aware of growing racism and antagonism in Notting Hill that would erupt in the violent riots of 1958. A moment of stark illumination occurred when Hall addressed the white children he taught and asked them to provide an account of their hostility to newly arrived migrants from the Caribbean. He was told, "Well, they're taking our women," and, "They're taking our things" (Hall and Back, 2009, p. 672). Hall recalls:

So I said, "Do you mean these?" And I pointed to several black kids in the class and they looked at them as if they'd never seen them.

The white children retorted, "No sir," before expounding: "They're one of us" (Hall and Back, 2009, p. 672). Hall asked, "What about me?," only for the response to echo what he had already heard: "No sir. Not you. Them" (Hall and Back, 2009, p. 672). How many migrant and refugee students hear similar words, hear, for example, "They are taking our jobs, our benefits, but not you, you are different"? Consider, for example, a story told by Musa Okwonga, the son of Ugandan refugees forced to flee from the rule of Idi Amin to seek sanctuary in the UK. Okwonga describes sharing a meal with a friend, who suddenly "launched into an astonishing rant against migrants" (2020). When Okwonga pointed out that he and his parents "were no different" from the people his friend "was denigrating," he was told: "I don't see you as a migrant, Musa. I see you as a friend" (2020).

What does it mean to be counted as "one of us," knowing that at any moment one might be counted among the "them," the others? How must it feel to be a displaced person listening to their peers, students, or friends as they disparage migrants or refugees? Once again, Goffman's account of stigma is illuminating. Stigma, Goffman observes, acts upon an individual to exclude them both in their relations with others and, crucially, in their relationship with themselves, it "spoils his social identity; it has the effect of cutting him off from society and from himself so that he stands a discredited person facing an unaccepting world" (Goffman, 1990a, p. 31). And yet, alongside such "discredited" persons, there are, also, those people who live in the knowledge that they are, in Goffman's (1990a) language, "discreditable." Something of the experience of being included in an educational setting, while all the time knowing that hostility might be directed one's way, that some social prejudice or stereotype might thoughtlessly be given voice in one's presence, is conveyed by Joseph Azam. Writing of his experiences of growing up in New York in the 1980s, Azam (2018, p. 29) recalls how children from families like his, families that "had recently come from some distant place in search of a better life," could be identified as different by the clothes they wore, their presence as informal translators at parent-teacher meetings, and even by their very names. And so, they "stood out and were each vulnerable" in their "own way" (Azam, 2018, p. 29). His own vulnerability, Azam (2018, p. 30) tells us, necessitated an "effort ... into curating" his "identity," to "managing" his "otherness."

There are thus many possible dimensions to a refugee student's experience of displacement. Of course, there is the original displacement from their native country, but this original dislocation can be followed by a seemingly permanent experience of uprootedness, of never quite belonging. Alongside this experience, there may be a displacement of a refugee student's identity, a jarring sense that their identity can be neither cultivated nor celebrated within the tapestry of their everyday social interactions, but must, instead, as Azam (2018) stresses, be managed. No wonder, then, that Tran describes how, "on the inside, away from the eyes of those who see her only as a refugee," a displaced person, "especially if she arrived at this status as a child, ... will go on to feel as though she is not whole in some way" (2018, p. 153).

What is missing when a refugee student's identity becomes displaced in this way is the kind of "wise" attention that Goffman (1990a, p. 41) detects in those people "intimately privy to the secret life of the stigmatized individual and sympathetic with it." Indeed, among those persons who are not stigmatized, Goffman (1990a) draws out a clear distinction between those he names the "normals" and those he calls "wise." In contradistinction to the "normals," cut adrift from the stigmatized, Goffman (1990a, p. 41) characterizes the "wise" as "marginal" persons, "before whom the individual with a fault need feel no shame nor exert self-control, knowing that in spite of his failing he will be seen as an ordinary other." In relation to refugees, to be "wise" is to see the person forced to migrate from their native land as something more than a pitiable or suspicious other. It is, instead, to encounter this person in the unfolding of their distinctive and "ordinary" identity. It is precisely in this way that we might begin, in our schools and in our communities more generally, begin to counter the "bigotry directed at migrants and refugees" that is

“contingent upon their dehumanization and deindividualization” and which sees them “presented and thought of as a mass of nothings and nobodies,” in short, as “a faceless mass” (Hemon, 2018, p. 92).

Refugee students, assimilation, and identity performance

In his analysis of the lives of exiles, Zygmunt Bauman traces out how losing a place in the world leads to a loss of identity and then, finally, to a quest for acceptance by way of assimilation:

What makes the exile an unreal place is the daily effort to make it real—that is, to cleanse it of all things that are out of place. In exile, one is pressed to stop being in exile; either by moving elsewhere, or by dissolving into the place, not being anymore out of it. The latter is the pressure of assimilation. To be like anyone else. Not to be odd anymore—to renounce one’s nonidentity, that is, to renounce one’s identity in the name of a new identity, which would be nonidentity.

Bauman (1996, pp. 569–570).

Assimilation is, as Bauman suggests here, a hopelessly self-refuting process, an unending seeking of a place in the world, an unceasing quest to supplant one’s own identity with some accepted identity. We turn now to examine four paths that promise assimilation for refugee students, each of which is rather like that trodden by Sisyphus, condemned by the god Zeus to eternally push a boulder to the summit of a hill only for it to descend back down to lower ground.

Performing the identity of a native

Arendt (2007a, p. 265), writing of Jewish refugees in 1943, observed that “after four weeks in France or six weeks in America, we pretended to be Frenchmen or Americans.” Arendt goes on to note that for “the more optimistic among us” it is “only their new country” that has “taught them what a home really looks like” (2007a, p. 265). And yet, Arendt (2007a, p. 272) recognizes that “under the cover of ... ‘optimism’ you can easily detect the hopeless sadness of assimilationists.” Here the task of forging an identity has become an extended exercise in what Goffman (1990a) names “passing,” where one attempts to become something one does not entirely feel oneself. This task can also involve, in Goffman’s (1990a) phrase, “covering” up any attributes that might negatively distinguish one from others. However, whenever a refugee is able to successfully “pass” as a native or adequately “cover” up any of their distinguishing characteristics from them, their achievement is, and only can amount to, the *presentation*, and not the *disclosure*, of an identity. Thus, Tran notes that “a refugee is ... like an actor,” before explaining:

She knows she must assimilate in order to earn acceptance, to survive and prosper, but the act of assimilation is inevitably a performance—not of a false or superficial identity necessarily, but of one more legible to her audience. She becomes versions of herself, donning the new clothes and accessories, the new habits and modes of behavior that hew to the various settings of her new life (2018, p. 153).

A performed identity might not be “false or superficial,” and it might be argued that all identity is a form of presentation (see, for example, Goffman’s (1990b) *Presentation of the Self in Everyday Life*), but the performance or presentation Tran (2018) describes here is delivered to some extent in the negative and thus cannot be entirely affirmative.

Something of the complexity that can characterize the performance of an identity by refugee students is expressed by Okwonga, whose parents were Ugandan refugees. Okwonga describes how, at the private boys’ preparatory school he was given a bursary to attend, he “became an unofficial ambassador for black people” (2020). He goes on to recall how he studied with a “furious sense of mission” in the belief that, by making “a good impression,” he “could help to erode some of our society’s firmest prejudices” (Okwonga, 2020). Later, at the private school, Eton, Okwonga (2020) was to learn of the impossibility of changing some “perceptions of black people merely by being as hardworking and as agreeable as possible.” Such experiences tell us much about how, for refugee students, achievement in school can take on a double aspect: it can be both a way of confirming something positive about their individual identity and a way of attempting to refute social prejudice. Indeed, identity performances always aim to “pass” and not simply to disclose; to “cover” and not wholeheartedly to reveal. Hence, even before the student’s identity performance begins, its success can be determined, not only by what it shows to its audience, but also by what it manages to hide from them. In other words, the performance of an identity is underscored by the alienation of the performer both from their audience and from themselves.

Performing the identity of a deserving refugee

In 1944, Arendt wrote of how, despite the limited number of refugees in the US, it was always possible to hear “at least one parliamentarian asking in baffled tones just how far one intends to go trading ‘fine young Americans for refugees,’ and at least one widely read journalist ready to discredit them with the platitude that ‘not all refugees have been ennobled by their sufferings’” (2007b, pp. 211–12). In the intervening time what has changed? It is worth reflecting on these words, spoken by the Former British Prime Minister, Theresa May, when she was the UK’s Home Secretary, to a BBC Radio 4 interviewer: “People talk about refugees, but

actually if you look at those crossing the central Mediterranean, the largest number of people are ... economic migrants" (May, cited in Kingsley, 2016, pp. 41–42). Consider also that when he was the UK's Prime Minister, David Cameron, spoke of "a swarm of people coming across the Mediterranean, seeking a better life, wanting to come to Britain because Britain has got jobs, it's got a growing economy, it's an incredible place to live" (cited in BBC News, 2015). Consider, also, the words of the UK's current Prime Minister, Boris Johnson, who described crossing the English Channel to seek asylum in the UK, as "a very bad and stupid and dangerous and criminal thing to do" (cited in Grierson and Sabbagh, 2020). So, politicians in the UK and elsewhere continue to advance a firm distinction between those small number of worthy refugees from the majority of unworthy, illegal migrants. The inference for the refugee is clear, it is their duty to establish their legitimacy. Hence Nayeri tells us: "Every day of her new life, the refugee is asked to differentiate herself from the opportunist, the *economic migrant*" (original emphasis, 2020, p. 8). And there remain journalists equally zealous in advancing their pronouncements of the unworthiness of some, if not all, refugees. Consider, for example, the columnist, writing in the UK's biggest selling daily newspaper, who described refugees as "cockroaches" (Hopkins, 2015). The expression is extraordinarily degrading, of course, but all the time refugees are held to be irredeemably suspect they are, like all stigmatized persons, believed to be, in Goffman's (1990a, p. 15) phrase, "not quite human." Indeed, Nguyen (2018, p. 15) echoes Goffman when he observes that a refugee, "classified as an *other*," is—if they are seen at all—viewed as "not truly human ... but is instead a stereotype, a joke, or a horror."

Immediately, we might note, with Carens (2003, p. 102), the impossibility of determining a "single bright line dividing those who deserve asylum from those who do not." But all the while the division retains its power to exclude, refugees, in their efforts to shun the stigma of being perceived as an "economic migrant," fearing the accusation of mediocrity, will continually struggle to excel as they seek to generate "proof that letting in refugees has a good, healthy return on investment" (Nayeri, 2018, p. 146). For a young refugee, one way of distancing themselves from the category of "unworthy migrant" is to perform the identity of a brilliant and utterly dedicated student. Hence, Nayeri describes her own exceptional efforts to dedicate herself to her school studies as she endeavored to ensure that she did not "lose everything," her "entire identity as a smart, capable girl" (2020, p. 293). The performance of the devoted student is not, of course, devoid of disclosure—it exposes the refugee student's need to fit in, to "pass," and in this way, it reminds us of the profundity of the human need to belong. But the performance can reveal only what the refugee has been deemed to lack and what they long to disprove. Where is there space here for the emergence of a love of learning that is its own reward, and not a marker of assimilation?

Performing the identity of a grateful refugee

Nayeri (2020, p. 197) recalls how, in the Oklahoma school she attended, her success in producing a papier-mâché topographical map of the United States came to be "strangely central" to her teacher's efforts to support her "American assimilation." When Nayeri explained that just a few months previously she had been a refugee, living in Italy, the teacher responded "sleepily," with the words: "Awww, sweetie, you must be so grateful to be here" (2020, p. 197). Latent in this teacher's word, "gratitude," there is both a judgment and a demand. Indeed, throughout her memoir, Nayeri (2020) conveys the burden of gratitude that can be carried by refugee students. The refugee student, she suggests, can feel an almost constant pressure to demonstrate that they are glad, not only to be here, in this new land, in this new educational setting, but also that they are grateful *not* to be there, in their native land, which can be afforded no redeeming, and certainly no delightful, qualities. Such assimilation comes at a cost, it means repudiating the memories and experiences that together inform a young person's identity and enrich their hopes for the future. Already displaced from the place that was once their home, the young person is asked to distance themselves, also, from their memories of this place. Here again, it is possible to detect the complexities and multidimensional aspects of displacement in the lives of refugee students.

Performing the identity of a heroic refugee

In 2018, an extraordinary story was reported around the world about a young man named Mamadou Gassama (see, for example, Hughes, 2018). Walking through a northern Paris suburb, Gassama noticed a crowd staring up at a tiny boy hanging precariously from a fourth-floor apartment balcony. In an act of astonishing athleticism, Gassama scaled the building, moving from one balcony to the next, before pulling the child to safety. In time it transpired that Gassama was an economic migrant from Mali, with no legal status in France. And yet, this remarkable act led Emmanuel Macron, the French President, to bestow Gassama with French citizenship, along with a medal of honor in recognition of his courage.

It is possible to feel awe at Gassama's feat, to recognize and esteem the qualities of character that made his deed possible, and at the same time to be troubled by the idea that only supreme and astonishing accomplishments can transform newcomers from illegal strangers to good citizens.

This troubling sensation might be understood in direct relation to the double exclusion that occurs whenever a refugee is separated out from "economic migrants." First, there is the exclusion of this isolated individual. As others retell the story of their deed or deeds, there is always the possibility of sentimentalization and sensationalism and, worse, of positioning the refugee as a passive beneficiary of their hosts' magnanimity. Hence, Nayeri (2018, p. 146) asks aptly: "isn't glorifying the refugees who thrive according to western standards just another way to endorse gratitude politics?" The irony here is bitter: even as a refugee is elevated to the status of hero, so they are reduced to a mere means for the confirmation of the goodness of their host. It is possible to detect this same process in schools. Consider, for example, the situation in which a once excluded or marginalized young person's success in meeting predetermined academic standards is taken to be proof of the tireless endeavors of their teachers and parents. Second,

there are exclusionary consequences for refugees and those persons who are regarded as “economic” migrants. Of course, for all the “tales of heroes of assimilation who have penetrated new areas of normal acceptance” (Goffman, 1990a, p. 37), most refugees and migrants will find “passing” for a native an endless journey with no destination, a process of incessantly assimilating without ever becoming assimilated. Indeed, exceptions to the rule, like Gassama, are so very exceptional that stories of their assimilation serve to fortify the status of the refugee as strange, entirely other. More than this, the majority of people fleeing from persecution can always be judged in relation to this image of the heroic refugee, a judgment that condemns them for the very ordinariness that Goffman assures us “wise” people look to when they respond to another human.

Refugee student identities and “wise” educational spaces

Nowhere is “wise” attention more needed than in the education of refugee students. So, we turn now to the educational philosophy of Maxine Greene to imagine possibilities for an education of refugee students that is freed of all expectation of assimilation, worthiness, and heroic commitment.

Refugee students and the project of answering back to identity projections

Greene has acknowledged the debt her own educational thinking owes to Sartre’s (1963, 2007) characterization of human existence as “a project.” This idea emerges out of the central tenet of Sartre’s existentialist philosophy. Each of us, Sartre (2007, p. 23) argues, “is indeed a project that has a subjective existence,” before which “nothing exists.” In other words, it is the task of each person to determine the nature of their own existence, since, beyond that which we create of ourselves, “there is no human nature” (Sartre, 2007, p. 22). In fact, the distinct identity of each individual may be thought of as an ongoing outcome of this “project.” And while Sartre maintains that it is entirely up to each of us to shape this project for ourselves, we cannot wish it away. We can choose not to choose, but we cannot choose not to have a choice.

Reflecting on Sartre’s existential philosophy, Greene writes: “We may be moved to choose our project, because ... we are trying to become what we are not yet by acting on perceived deficiency, or on perceived possibility” (1978, p. 26). Acting on “perceived possibility,” one’s identity might be conceived as an ongoing and active attempt to answer a question that can never be definitively or satisfactorily answered, the question of who one is or at least of who one wishes one could be. But if we act under the shadow of one “perceived deficiency” or another, we act against what we are not, and the project of identity formation is supplanted by the task of answering back to identity projections cast our way by others. This necessarily negative project is firmly anchored in the past. The construction of an identity in opposition and resistance to a tirade of stereotypes and degrading expectations is, in other words, quite different from that ongoing process of forming an identity that affirms and even celebrates a person’s distinctiveness.

Nayeri (2020, p. 12) tells us that, on gaining refuge in America, she was assured that her life was her own to determine, that her “gender would no longer limit” her distinctive “potential,” and yet, she came to realize that “already a limit” had been “imposed” on her life, since her “first category had been assigned: refugee, not native-born.” With these words Nayeri encapsulates the violence inherent in the act of naming the identity of another person, in attempting to strike from their hands the chance to answer for themselves those existential questions pertaining to who they wish to be and who they wish to become. Interestingly, the subheading of Goffman’s (1990a) book *Stigma* is *Notes on the Management of a Spoiled Identity*, and the identities of refugee students may be spoiled, not only when one reductive identity or another has been imposed upon them, but when the very project of creating an identity of whatever kind has been disrupted.

Teacher identity and the capacity to heal

In the face of such violence and exclusion, it is both heartening and useful to reflect on the hope expressed by Greene that we might “see more and more teachers willing to choose themselves as healers” (1993, p. 215). Of course, teachers who take responsibility for healing those refugee students whose identities have been spoiled do so by reaching out to, and working in unison with, other agencies and experts in various fields, including trauma, law, and language acquisition. And yet, these teachers can themselves make a considerable difference simply by choosing to be “wise” in their encounters with refugee students. Indeed, Ron Baker’s reflections on his experiences as a child transported to England from Nazi Germany have much to teach us about the necessity and effectiveness of such “wise” teachers. Baker tells us that “the process of having one’s roots disturbed and rearranged is not an easy one” (1990, p. 64), before going on to give voice to a refugee child’s “sense of isolation” and their “gnawing aching need for acceptance, love and security” (p. 65). Grande’s conclusions, born of her own experiences as a migrant student in the US, are equally as instructive. “Nothing is more counterproductive than the goal of rapid integration of immigrant and refugee children into the community,” Grande insists, before noting:

Assimilation and acculturation add to their post-traumatic stress. Immigrant and refugee children need time, patience, love, and psychological help to heal from their experiences (2018, p. 78).

These moving articulations of those qualities of acceptance, security, patience, and love that can be so needed by refugee students remind us of the extraordinary qualities that teachers can and do bring into the ordinary lives of their classrooms.

To suggest, with Greene (1993), that teachers might choose to heal the identities of refugee students is not to deny that often “identities are constructed within, not outside, discourse,” that they can be formed “within the play of specific modalities of power,” and that they can, in short, be “the product of the marking of difference and exclusion” (Hall, 2003, p. 4). It is, rather, to acknowledge the reality that identities can also be—and indeed often are—formed in educational settings where the discourse of teachers is, in Foucault’s phrase, “a hindrance, a stumbling-block, a point of resistance” to those reductive and otherizing discourses that marginalize and silence refugee students (1990, p. 101). It is to acknowledge, that is, those teachers who engage in the necessary and ongoing work of examining how they might, in Greene’s words, “keep pondering the meanings of inclusion and wondering how it can occur without the kind of normalization that wipes out differences” (1993, p. 212). Noting how such teachers “suffer in many ways what they experience as conditioning or manipulation by their superiors or by the ‘system’ itself,” Greene goes on to argue that it is exactly the reflective capacity of these teachers that enables them to recognize these exclusionary factors as “forces that frustrate their quests for themselves and their efforts to create themselves as the teachers they want to be” (1978, p. 34). Such forces and pressures are frustrating to teachers, in other words, precisely because they experience them as hinderances to the advancement of their identities. Indeed, it might be that this very identity, at once professional and personal, fortifies and bolsters these teachers in their daily efforts to block narrow and quantitative targets, league tables, prescribed curricula, and shallow expectations from fully impeding upon, and thus diminishing and delimiting, themselves, their teaching, and the children they teach. The inclusion or exclusion of children receiving or seeking refuge turns at least in part, then, on how teachers live out their answers to existential questions concerning the sorts of schools they wish to create and the types of teachers they wish to become.

Conclusion

What would it mean for refugee students to forge their own identities? This chapter has called for critical attention to be given, not only to what has happened to and what is happening in, the lives of refugee students, but also to the social attitudes that can act upon these students to diminish their identities. This involves answering the situation in which refugees, despite the best of their efforts, can never quite succeed in “passing” as natives, can never sufficiently prove their merit, their gratitude, or their heroic qualities, and so pass from “one of them” to “one of us.”

Following Goffman’s (1990a) account of those “wise” persons who, in opposition to the so-called “normal” individual, conceive the stigmatized beyond their stigma, this chapter has called for the recognition and rejection of dominant narratives of “successful” or “included” refugee students. This necessitates becoming acutely aware of “ways of using language that lead to the ... identification of certain kinds of being as undesirable” (Greene, 1993, p. 216). In particular, it means attending to ways of talking about dispossessed and displaced people that can generate images of “worthy” and “unworthy” students and so result in the “demeaning of poor and immigrant people’s experience” (Greene, 1995, p. 51). A “wise” education, the chapter has suggested, resists this distinction between the deserving and the undeserving immigrant, along with the more general assumption that while some students are worthy of a teacher’s dedication, others are “disaffected,” “lazy,” “disruptive” and so on.

It is “a writer’s dream,” Nguyen (2018, p. 22) contends, “that if only we can hear these people that no one else wants to hear, then perhaps we can make you hear them, too.” Might this not be the dream of teachers, also? The teacher who listens to young people who have been uprooted from their homes, to include them not only as they speak, but also to bolster their growing sense of distinctiveness so they might come to risk speaking out to the world. The necessity of listening and thinking beyond narratives of assimilation, of becoming aware of the various ways they can, in Goffman’s (1990a) crucial phrase, “spoil” the identities of refugee students, informed this chapter’s argument for educational spaces where teachers recognize and act upon what Greene (1993) understands as their capacity to heal. This means generating dialogs of becoming, and not assimilation, in our schools; it means teachers realizing their capability to create spaces that, again following Goffman (1990a), might be thought of as “wise.” Within these spaces, refugee children can contribute to ongoing dialogs without confronting the kind of unthinking expectations that Goffman (1990a) alerted us to. Crucially these are educational spaces where dialogs flourish between people who do not have to prove themselves worthy, since their worth, as human beings and as contributors to an ongoing and expansive conversation, is presupposed from the outset.

Introduction

Educational trends leave their mark on classrooms and on education systems across the world. Educational initiatives or programs based on: mindfulness, growth mindset, belonging, positive behavior interventions and supports (PBIS), for instance, have been implemented across tens of thousands of education settings internationally, often, but not always originating in the US PBIS, alone, claims to have been adopted in 25,000 US schools by 2018 (Kittelman et al., 2019) and is increasingly used in schools in Australia, in England and in many European countries (Poed and Whitfield, 2020). Trends rise and gain influence across school systems in relatively short periods of time. Mindfulness, growth mindset and belonging, along with other prominent, trends were relatively unknown in the education sector, in the English-speaking world at least, before 2010 (Armstrong and Armstrong, 2021).

Despite their prominence in the classroom, comprehensive critical scrutiny of trends is rare (Adey and Dillon, 2012) – a strange absence given the thousands of studies which evaluate the benefits of individual educational initiatives, programs or commercially branded interventions. If these phenomena are recognized as trends at all, existing educational research often takes a limited perspective. Research studies tend to investigate, for instance, which specific mindfulness-based programs are most effective in educational settings, rather than asking deeper questions about whether, for instance, in the case of mindfulness appropriating religious practices from Buddhism for trivial, non-religious use is ethically acceptable (Armstrong and Armstrong, 2021). Acknowledgment of cultural, financial or political agendas driving the promotion of particular trends is often missing in literature (Molnar, 2018). This absence is concerning given the major commercial and political interests involved in, for instance, promoting software apps for behavior management (Manolev et al., 2019) or advocating synthetic phonics as the pre-eminent method for teaching reading (Glazzard and Stones, 2020).

Recent, pioneering research by Armstrong and Armstrong (2021) has sought to address these shortfalls and present the bigger picture about educational trends: this article explains advances made by this emerging research, including the birth of the exciting new sub-field of critical trends analysis (CTA). An initial finding of the application of CTA across 18 prominent educational trends is that a significant cluster of educational trends drive ever greater educational exclusion of students with disabilities in public school systems in Australia, England and the US. The constitution of this grouping is discussed together with the implications of this finding – particularly the concerning point made by Armstrong and Armstrong (2021) that progress toward a more inclusive and equitable education system is compromised by the growth of trends which construct public education as an outcome-centric and performance-driven sector.

What are trends? A definition of educational trends

Following Armstrong and Armstrong (2021) these can be defined as:

Definition of educational trends

An eclectic group of practices, concepts, programs, cultural movements or educational initiatives has widespread uptake (popularization) across educational systems and settings. Trends can also be recognized with an identifiable term or terms which signify their main idea or benefit; neurodiversity, mindfulness, inclusion, or behavior management. Trends have either shaped public policy or have been popularized by public policy, often in conjunction with coverage in the media or marketing promotion by a commercial organization. As social phenomena, trends can be understood through looking at their lifespan, where they can be categorized as emerging, dominant or in decline.

A growing number of educational trends have emerged since the 1990s, suggesting an acceleration in the underpinning drivers for popularization and adoption of trends. Synthetic phonics, evidence-based practice, mindfulness, growth mindset, belonging and many other terms gained widespread adoption across education systems in the English-speaking world from the 1990s onwards, although many have much older origins. Older traditions in pastoral care can be understood, for instance, as the historical precedents for recent educational initiatives which stress the importance of attending to student wellbeing (Purdy, 2022). Recognizing these historical roots might suggest that many trends are flimsy, time-limited phenomena which re-brand older traditions – qualities attributed to fads.

What are fads? A definition of educational fads

Following Armstrong and Armstrong (2022) an educational fad could be defined as:

Definition of a fad

A pejorative (negative) term to describe an educational trend which has little intellectual substance and which is temporarily popular. Lack of durability is an element of the negative framing of fads.

The current popularity of evidence-based practice (EBP) as a desired feature of education often means that fads are typically framed, in opposition, as highly undesirable trends, although evidence-based practice is, itself, a trend originating in medicine and health science in the 1980s and subsequently applied to education (Connolly et al., 2018).

The framing of low cultural value embodied in the word “fad”, draws on deep seated value systems stretching back across time into the 20th and nineteenth century (Williams, 1976). Current educational trends are better understood, arguably, by avoiding value-laden evaluations like “fad” and, instead, by taking a longer-term perspective on their emergence using theory designed to understand cultural production. What immediately follows provides an explanatory framework for educational trends, drawing on sociological theory about cultural production, specifically the production of value. Explaining why trends appeal to teachers, education leaders and, also, other influential system-actors such as “policy entrepreneurs” is central to this framework. As is highlighted, this framework plausibly explains why there has been an acceleration in the number of trends appearing and being adopted in education systems in Australia, England and in the US since the 1990s.

In the UK, US and in Europe industrialization and urbanization in the later 19th and 20th century were drivers for mass cultural production and consumption on a scale hitherto unimaginable (Herbert, 2007). At the same time these societies were highly socially stratified, with social hierarchies based on perception of an individual’s class, race, employment, gender, ethnic group or sexuality (DiMaggio, 2019). The growth and increasing differentiation of the cultural market was accompanied by the growth of ideas and fashions which led to increasing differentiation of cultural goods to meet niche cultural markets. Consuming these cultural goods and adopting associated social practices, involve what the French sociologist Pierre Bourdieu describes as the “distinctions”: the advantages which adopting these fashions conferred on the individual in complex, increasingly urbanized and stratified social spaces. As Bourdieu convincingly suggests, developing what he describes as personal “cultural capital” through adopting fashionable attitudes, practices, and customs (“lifestyle”) is an attractive strategy for individuals who live in socially stratified societies built around hierarchies and the ethos of competitive individualism (Bourdieu, 1987). This sociological model of cultural production and cultural consumption has relevance when considering educational trends occupationally and their function in the education sector.

One plausible explanation for the power of educational trends is that demonstrated knowledge of trends, preferably signified in social situations such as a school staffroom or professional learning event, confers professional cultural capital on the individual. Such an application is consistent with Bourdieu’s emphasis on what motivates individuals to adopt specific social behaviors, around cultural consumption: for instance, the outward demonstration of culturally discerning behaviors related to precious knowledge of the new and emerging fashion (Bourdieu, 1987). Furthermore, this use of knowledge about trends as a form of cultural capital structurally fits with Bourdieu’s pessimistic evaluation of the “education system (as) a ‘conservative force’ given its primary role in the reproduction of existing class relations” (Brown et al., 2016, p. 191). This sociological explanation of the rising appeal of educational trends is strengthened by considering negative processes affecting occupational working conditions in public education in Australia, England and the US over the last 20 years.

Persistent deterioration of occupational working conditions in public education in Australia, England and the US has occurred, involving, for instance, increasing casualization and performance monitoring together with ballooning workloads (Flores, 2020). Indeed, working conditions have deteriorated to such an extent that recruiting and retaining teachers is now an endemic problem in many areas of Australia, the UK and US (Garcia and Weiss, 2019). These larger occupational changes can be understood as driving the increasing desire for professional distinction by teachers in an increasingly competitive, performance-obsessed, and insecure workplace (Flores, 2020; Lo, 2012). This driver for professional success through distinction does not only apply to “shop-floor” educational staff (teachers, tutors, lecturers, classroom assistants, sessional lecturers) but cuts across professional hierarchies.

Currency with the latest ideas and with trends is often built into the person descriptions (PDs) of employment for educational leaders in public education, including Principals, Heads, Center Managers, Associate Deans and Deans, together with the complex managerial lexicon of staff titles in educational bureaucracies. Identifying and promoting new practices, concepts, programs, cultural movements or educational initiatives is often motivated for professionals by employment-related key performance indicators (KPIs) and performance review goals: practices which are described by Flores (2020) as expressions of the increasing “technicization of teaching” (p. 220). Many of the trends which occupy educational leaders’ time on a day-to-day level are handed down by local, state/regional and national/federal government. Addressing these multiple demands is, unsurprisingly, cited by teachers and school leaders as a major driver for high workplace-related stress. An important report by detailing findings from a national survey of teachers about perceptions of the teaching profession (n = 2444), for instance reported teachers urging government to “introduce fewer initiatives simultaneously” and requests to “let people solidify their practices and work before bringing in the next idea” (p. 14).

In parallel, over the last 20 years, governments across the English-speaking world have increasingly prepared education, health and hitherto wholly public areas of public service, for commercialisation.

These policies, enacted by governments at all levels across the English-speaking world, are based in philosophical ideas about the need for small government and emphasize the primacy of the market, calling on ideas by economists such as Friedrich Hayek. Arguments in favor of “rolling back the state” and in favor of individuals making decisions in the extended market places are commonly described as expressions of the political philosophy called neo-liberalism. In their perceptive book *Governomics*, for instance, describe a growing “push to commercialize the common wealth” (p. 249). Public education, like public health, is a major element of this common wealth in Australia and the UK for instance, and historically has been a focus for public spending by government. Many educational trends have been at the vanguard of the efforts to commercialize “common wealth” and as part of concerted neo-liberal education policies to reduce tax costs for business and the corporate sector via greater involvement of the private sector in delivering public education.

Prominent educational trends respond to this increasingly neo-liberal public policy environment in myriad ways. Armstrong and Armstrong (2021) provide the following structure (with headings in italics given for each grouping of trends) to make sense of this interaction – a structure they suggest focusses on the psychological appeal of types of trends to teachers, educational leaders and other education professionals responsible for adopting them:

Performance enhancing trends

These trends build on the premise that students are academically underperforming, feeding off a sense of performance crisis often popularized in the media or government reports – the “problem”. Deficits in a student’s reading performance, mathematical knowledge or scientific knowledge are often focused upon using metrics based in comparative international student performance. Trends in this category claim they can boost student performance, “the solution” – and in doing so ultimately seek to improve school performance and student attainment as measured by national or international metrics. Performance enhancing trends present a convenient tool for meeting KPIs for educational leaders and across education bureaucracies. Trends in this category are often framed instrumentally and adopt simplistic, input → output logic, ignoring complex contextual factors.

Technical trends

Focusing on technical wizardry, “new” or “scientific” knowledge make up the appeal of trends in this category. Technical trends often infer that they can bypass the complex, time-consuming, human, political and institutional factors which make up contemporary classroom practice – offering an attractive apparent shortcut. Technical trends align well with innovation and systems-thinking, values that are increasingly prized professional attributes in the education sector and they also draw on older ideas about the benefits of “machine thinking” in this context. Max Weber, who coined the word bureaucracy, favourably discussed an efficient “bureaucratic apparatus” in his book *Economy and Society* published (posthumously) in 1921 (Weber, 1978).

Crumbling orthodoxy

Trends in this category inhabit mainstream space in educational practice and discourse, constituting widely-accepted “common-sense” cultural and professional knowledge held by teachers, education leaders and policymakers. The term “crumbling” refers to shedding of value which occurs to dominant belief systems when they occupy this central space in a system where innovation and change is increasingly privileged.

Cures, therapy and hope

These trends comprise a varied group which respond, in different ways, to longstanding structural problems in education and in some cases, to the accelerating neo-liberal direction of educational policy.

Trends of the near future

These trends have not yet achieved mainstream orthodox status in education – for many reasons – but could in the future rise to dominant status.

Educational trends and exclusion

Armstrong and Armstrong (2021) advance this analysis of trend categories by suggesting that meta-trends become visible at the highest scale of scrutiny and when looking across the broad sweep of public education systems. A grouping of trends which service neo-liberal policy goals including the increased marketization of public education make up one important meta-grouping. Armstrong and Armstrong (2021) describe an influential grouping as the “performative school” and suggest that a rising tide of exclusionary practices in public education systems are driven by the growing influence of the performative school meta-trend.

According to public data, the formal educational exclusion of school age students in Australia has risen inexorably over the last 5 years at least. Multiple public enquiries and policy reports across different jurisdictions have concluded that children or young people with disabilities are grossly over-represented in these statistics. For instance, the recent Disability Royal Commission Hearing 7 (DRC, 2020) acknowledged that the application of disciplinary sanctions, including exclusion (expulsion) from settings was an escalating problem for students in this population and was highly critical of these practices by schools.

Australia is not, it seems, a special case in the English-speaking world. Although interrupted by the COVID-19 pandemic, the UK Government’s latest report highlights that when, “Looking at Autumn term (2019/2020) only: there were 3200 permanent exclusions in 2019/20 (up 5% from 2018/19) and there were 178,400 suspensions (up 14%)”. The US has seen sustained growth in school exclusions, featuring the popular trends of “three strikes” and “zero tolerance” movements across the school system (Gage et al., 2019). Deeper analysis of school exclusion statistics reveals that this phenomenon affects some of our most vulnerable and disadvantaged children and young people. In the US, African-American students are disproportionately represented in statistics concerning school exclusions collected since at least the 1990s (Gage et al., 2019; Skiba et al., 2011). In Australia students who are indigenous are consistently over-represented in school exclusion rates (Higgins et al., 2021) as are children and young people affected by disability.

In parallel with a growth in official exclusions, gray exclusions, appear to be surging. Gray exclusions constitute a wide range of informal and often subtle practices and actions by school staff which marginalize and exclude students, often resulting in a change of setting for the student. In the UK one prominent practice associated with gray exclusions is off-rolling which constitutes: “illegal permanent removal of students from school rolls where removal is in the school’s interests and designed to enhance school performance data” (Done and Knowler, 2020, p. 1). In many cases informal actions by school staff lead to students simply withdrawing from their existing education setting: an outcome also described as “early school leaving” or more judgmentally as “drop out” (Squires, 2020).

Formal exclusion and gray exclusions counteract policy initiatives designed to bring about greater social justice in education systems. Australia and the UK (although not the US) have, like many countries, made a historic policy commitment to this progressive outcome as signatories to the UN *Convention on the Rights of Persons with Disabilities*. Failure, to meet this commitment in educational practice produces politically embarrassing headlines in the media and has attracted the negative attention from civil rights groups and organisations (AFDO, 2019) who criticize the socially regressive direction of education in Australia. Furthermore, the legal requirement to provide education in Australia, the UK and US, together with commitments to educational inclusion in policy at state or regional level, add further gravity to the problems caused by a growth in exclusions. Slee (2019) asks the critical question of whether belonging is meaningless rhetoric for children with disabilities in “an age of exclusion” (p. 28).

Highly critical public reports by system-level “guardians” and featuring highly critical analyses of exclusionary practice in schools, have added to the sense of crisis in the implementation of inclusion and conveyed a moral crisis about the treatment of vulnerable students in public education (DRC, 2020). Crisis narratives about “the future of inclusion” strengthen socially conservative efforts to reject progressive educational reform and threaten greater segregation in education systems, rolling back the hard-won gains won by advocacy groups and civil rights groups in the 1970s and 1980s (Slee, 2018). Researchers working in the field of inclusive education have noted the use of this rhetorical device in constructing apparent failure of inclusion. Boyle and Anderson (2020) describe how efforts to progress educational inclusion in Australia have been stymied by a wider movement, in educational policy, society and politics against social equality and which result in an apparent failure of inclusion.

They emphasize that: “Acknowledging and understanding the challenges that face successful inclusive education practice in Australia is imperative” and add “Without this knowledge it is too easy to lay blame for the increasing rates of segregation and exclusion at the feet of inclusion, to position the construct as an unattainable utopian ideal. Yet, it is evident from the brief discussion here that inclusive education has not been permitted to thrive (p. 208).”

The interesting concept of “astroturfing” could have some relevance to this analysis by Boyle and Anderson (2018). Political astroturfing refers to an apparently organic, spontaneous expression of representative public opinion about a contentious issue, but which is in fact, an orchestrated political campaign faking grassroots opinion on a social issue. The aim of astroturfing is to influence public opinion about this issue and initiate policy change. One distinct line of argument often heard in public discussion which constructs the apparent failure of exclusion is that “ordinary” teachers based in schools do not believe in it and support segregated school systems, unlike progressive educationalists based in universities. Watson and Barnes (2021) detail how what they

described as “New Right 2.0” in the UK and in Australia has framed this as an adversarial reality with “teachers against a progressive elite” (p. 216) and sought to use the fiction of unheard teachers’ voices as a lever for politicized policy change in favor of conservative or new-right principles.

Armstrong and Armstrong (2021) introduce critical trends analysis (CTA) as a new framework for evaluating the political and economic framework around emerging trends (p. 123). CTA is designed to help teachers; school leaders; and parents adopt a politically aware and research-informed awareness of new trends and evaluate their support for existing initiatives based on trends. This political awareness is vital because teachers, school leaders and parents have been core audiences for “New Right 2.0” campaigns designed to shift the policy agenda (Watson and Barnes, 2021) with trends often featuring as a strategic tool in this change process. Commercial interests also often promote educational trends targeting school leaders with a range of market products such as, for instance, electronic software to monitor student behavior (Manolev et al., 2019).

CTA calls on scholarship by Bacci (2012) and provides a critical methodology for asking questions about the politics and purpose of the problem-framing which trends are deployed to “solve”. Bacci’s (2012) approach is, itself, informed by post-structuralist critical discourse analysis (Fairclough, 2013) and which has intellectual heritage in theory about connections between power and language conceptualized by the French philosopher Michel Foucault (Ball, 2012). CTA applies this approach to guide the reader through a set of questions which foreground the potential power-relation, politics and commercial interests so that teachers and educational decisions makers have critical awareness of these potential biases before adopting new trends or renewing investment in existing initiatives. Whilst CTA is a highly practical approach it also suggests a new and exciting research agenda: for instance, using CTA to explore sector-specific occupational drivers for educational trends which erode inclusion and promote greater exclusion for vulnerable populations of students. Armstrong (2022), in collaboration with educational researchers based in England, has started to advance this agenda in an examination of gray exclusion.

Conclusion

Explaining the appeal of educational trends, together with their origins, lifespan and their many impacts offers a productive political and economic lens through which to consider educational inclusion. As detailed in this article, this focus helps to unpack rising rates of educational exclusion and illuminate public crisis narratives about the failure of inclusion. Examining educational trends also enables deeper sociological consideration of occupational changes in the education sector, connecting the “technicization of teaching” in classroom practice with a neo-liberal framing of education that is relentlessly outcome-centric and performance-driven, features which are part of wider efforts to marketize the sector, readying it for full commercialization. As emphasized in this article, these outcomes fundamentally oppose and undermine educational inclusion. More positively, this analysis reveals a shared ground for action and research-informed collaboration between educational leaders and practitioners who oppose these trends because of the damage they do to teachers’ work and wellbeing (on occupational grounds) and between educational leaders and practitioners who wish to advance an inclusive education system.

Because “community” doesn’t just happen

The term “community” is a frequently overused term in social policy. This is a problem for vulnerable population cohorts. Achieving community requires planning and investment but too often we assume that “community” just happens. The archipelago of Malta comprises three main islands and has a population of less than half a million people. The largest island of the three, Malta, is 27 km long and 14.5 km wide. Geographically and strategically, it is situated in the middle of the Mediterranean. Our geographical positioning has served us well politically and economically. Malta is a member of the European Union (EU) and is the smallest and most densely populated member nation. Being a country, which traditionally is very tightly knit, largely Catholic, in a small compactly populated geographic area contained within an archipelago would automatically seem to imply “community”. This cannot be further from the truth. Evidence from the “loneliness prevalence survey” I will be referring to later in this chapter affirms this. Malta is a deeply layered and complex country wherein camaraderie and community are not givens. Our neo-liberal, secularized country is evolving into a melange of individuals “happily” isolated from each other and it is probably the geography and the practicality of having the extended family for childcare reasons that keeps us distanced from each other even more. To write this chapter I have merged several articles I have written over the last couple of years that lay out the dangers of social fragmentation and what I see as being the primary actions needed to re-invent our communities. The indicators we are getting from the grassroots in terms of the social sector and the fissures we are experiencing is a major concern. This chapter asks: what are the ingredients that will construct a community of understanding (Bauman, 2001)? In what way do we make our communities function? How do we build active citizenship? The term “citizenship” implies engaging with one’s community through economic involvement, public service and other efforts to augment the quality of life for all (Azzopardi, 2011, p. 180) (Fig. 1).

The insider voices

Insider voices are fundamental in helping us to conceptualize community and how people are navigating the complex dynamics of everyday life. *The Story of David* brings out the desperation that people must deal with, but also surfaces the notion of resilience notwithstanding the bleakness that life seems to throw at him. On the other hand, *The Story of Marilyn* foregrounds the strength of the cult and how religion, spirituality and the belief in the self and others gives the needed impetus to carry on notwithstanding the adverse conditions created by the community. She offers very important reflections on the need for service delivery that doesn’t “pigeonhole” people. On the other hand, *The Story of Louisa* conveys the complex dilemma whereby tragedy and a willingness to go on in life is very clear. It is also interesting to recognize the strength of activism and how resistance starts from the stories and these insider experiences of people.

The Story of David

David is a well-known strategist both locally and internationally. He has worked on scoping exercises and the development of strategies all his working life. He has single-handedly led several organizations and proposed reforms on a mammoth scale. He often talked about his struggle with Bi-polar II. “Bipolar II disorder is a bipolar spectrum disorder characterized by at least one episode of hypomania and at least one episode of major depression.” (https://en.wikipedia.org/wiki/Bipolar_II_disorder). David spoke about the struggle he has had to face daily. He was diagnosed with this condition some 20 years ago. Before that, his mental health issues were pushed aside, and people would simply tell him to “get on with it”. He says that speaking publicly about his condition and how it impacts him is what gives him solace knowing well-enough that in the process he is helping others. He finds his immediate family his main source of courage. Another source of audacity are his pets who give him comfort knowing they need and depend on him. He does admit that at times it becomes very hard for those closest to him and recognizes that living with a person who must struggle constantly with this pain can get bumpy for them. Notwithstanding the support he has at home, there were moments where he just couldn’t take it anymore. In fact, during a current affairs radio show I anchor on 103 Malta’s Heart (<https://newsbook.com.mt/en/support-system-key-for-people-with-mental-health-issues/>) he explained how he had

Community participation
Young people should not only be given the right to vote, but also to contest general elections; yes, even as young as 16 years of age. Young people should be on government boards, lead authorities and have a voice in important decision-making arenas (Velasquez & LaRose, 2015).
We are nowhere near close to maximising the potential of our local governments. It would be prudent if we practiced subsidiarity and let local people lead their own locality – but with proper dedication of resources to support autonomy in management.
We need to deal with homelessness and rooflessness. This is a growing problem compounded by the Covid-19 pandemic. At times we think of people in need as benefit frauds and scammers whilst the truth is that usury, drug addiction, and unemployment are leading people to the brink. And while discussing homelessness, what about rent? It is another nemesis for our policy makers who need to juggle the right of people to retain a roof over their heads. There needs to be a fair deal for the tenants.
Alas, the social sector that I am arguing for proposes that we place NGOs at the centre of the debate. NGOs need to be recognized as being at the heart of our communities. They are the ones that need to oil our social machine. They are the ones that need to guide us at this juncture.
Strong community is sustained by care for the environment. Our trees should not be sacrificed to save traffic time. We need to take bigger decisions than simply felling trees. Trees are also memories. A healthy environment should be synonymous with social wellbeing. Gentrification and the way our country is going to the best bidder is worrying. Government needs to understand that not having enough space will result in distress (Vella, Falzon & Azzopardi, 2019).
We still have social classes in Malta and those at the bottom of the heap are disadvantaged whilst the rest are privileged in every sense of the word. We are a classist society and the political discourse insists that “we have a bigger middle-class”. This is incorrect.
The glass ceiling is still there, and gender issues remain prevalent. This country would be a better place to live in if we had more women at the helm in all sectors of society. I am also proposing that we address the issues around misogyny that encapsulates our country.
Liveability
There is no ‘nation’ but humanity, no colour, no religion that should distinguish us because we are all here to make this a better place for ourselves and others. Cosmopolitanism is of benefit to our society.
I believe that older persons are the ones we need to listen to. Their wisdom is for all to savour. Let’s treat them honourably and not turn them into the unwanted, pigeonholed in homes and residential services.
Immigration needs to be handled urgently and expediently. Malta should be the epitome of humanity and serve these people in need well. Whether it is boat people or people coming to Malta through any other way the truth is that we are duty bound not only legally, but morally to provide a safe haven.
We should also ensure that all those entitled to free medication are not made dependent on charity organizations, making them even more vulnerable.
Loneliness is a disfigurement of the illusion we have that our communities are inclusive. Research completed by the University of Malta Faculty for Social Wellbeing in 2019 has shown, that we have over 44% of our population who struggle with loneliness and social isolation. In this sense Covid-19 managed to surface existing shortcomings but hasn’t made this situation any better (Azzopardi, Bonnici & Clark, 2021).
There should be a concerted effort to stop drug trafficking – not enough is being done – drugs are everywhere, drug addicts are collapsing as we speak – the system has failed them. The proliferation of drugs especially amongst young people is devastating. The fragmentation there is between stakeholders is not making the situation any better.

Fig. 1 Manifesto of proposals.

Civil society
Charity collections should stop. When there is a new project being proposed or funds needed by an NGO we should avoid setting up a cantankerous campaign. Telethons should be focused on creating awareness of the issues and not on collecting money. Collecting money in this way should stop. We need marathons, but of ideas and solutions and of ways to attract volunteering and not scenes that dehumanise those at the 'bottom of the heap'.
The Commissions (those in the social sector) should be accountable to Parliament, but before that they need a revamp – they're just not working. The notion of Commissioners (for disability; for mental health; for children; for older persons; for migration; for domestic and gender-based violence, to name a few) is a noble concept that was set up with good intentions. I am suggesting that Commissioners should have a transversal role and they should respond to Parliament and not simply become part of a Ministry's trappings.
Parents should give quality <i>and</i> quantity time to their children.
People deserve to be happy and appreciate that life is beautiful – and for those people who don't feel that, then we should help them to find contentment.
Civil society is the citizens' last line of defence (Barrett, & Brunton-Smith, 2014).
Family is of the utmost importance and protecting this institution is essential for building community.
The national statutory social welfare agency needs to evolve into a coordinating entity.
Social policy actions
Poverty and social exclusion are blemishes – bi-products of a neo-liberal mindset that has encased our communities. It's how much you achieve in terms of money, estate and status which seems to matter nowadays and not who you are.
We still have far too many children in 'care'. Fostering is a great alternative but needs to be at the heart of our social provision with more dedicated funds and energy. Residential care is probably something we can't do away with now. However, what we need to keep investing in is adoption of children who have been abandoned by their parents. A lot of work has been done already, but we need to see more children moving into alternative families. Whilst we're talking about children, the court services responsible for child-related issues need to pull up their socks - they are in shambles. There is clearly a problem when it comes to issuing care orders, the lack of use of the children's house is inexplicable and the absence of promptness from the Court when it comes to decisions that are related to children is atrocious – it all moves at the pace of a snail.
Malta should return to its core values of being welcoming to people especially to migrants who need our hospitality. We can be an example to the World on how we deal with people who are desperate and not turn our face.
We should support parents who have lost their children to drugs, suicide, traffic accidents or sickness.
Alcohol sales should be controlled, but I see no interest from law enforcement to curb abuse.
I am also worried that the social sector is again spread amongst too many different Ministries with not enough efficient mechanisms to keep the system together. I must have counted at least nine different ministries who are involved in the social sector, and this is apart from the Parliamentary Secretaries who all have a finger in the 'social pie'. I expect that the Ministry responsible for social policy takes the lead – fragmentation is untenable.
It is the right time to close most of our residential institutions where some 10,000 persons live and bring these people back into the community – it's where they belong. We need to address institutionalization which runs into thousands of people being placed in residential homes. Related to this is that we also need to tackle loneliness which is leaving a scar on our society

Fig. 1 (continued).

<i>Social governance</i>
We need to stop hate speech and discrimination against people who are LGBTQI+. Good legislation does not automatically mean good quality of life.
Our communities should be physically and socially accessible.
Our Institutions have proven to be weak and succumb to the hidden powers (because of that journalist Daphne Caruana Galizia was assassinated) – we need a new form of governance with the proper checks and balances (van Zyl, 2014).
It is the time for a building construction moratorium - a time when we stop all construction for a year or two and give the nation some time to breathe.
Illegal drugs like cannabis should never be institutionalized, but I also believe that people who are addicted should be loved and not incarcerated. Drug addiction should be decriminalised.
Our state-run social agencies should be managed by people whose sole focus is the good of society.
<i>Values</i>
We should respect and value animals on the same level as we do human beings.
Arts and artists are the heart of our communities. Cartoonists are amongst my favourite.
The Catholic Church should return to its core teachings and be the important player it was in the past, but it must shed its negative institutional history. It should reach out to people beyond its parvis.
Prostitution is what it is and let's call it by its real name – 'prostitution'. I believe we shouldn't objectify women anymore. I also believe that domestic violence scars our society profoundly.
There is no life after death, but death remains the most important transition in life and we need to start talking about it, especially with children, more persuasively.
We need to have more talk shows and debates on our TV, Radio and news portals as stations are symptomatic of dialogue and not simply polarized. Our journalists should be protected. Politicians and public servants cannot choose when to reply to questions, they are obliged to do so. Added to this, I believe our media houses should be at least partially state supported. They are the pivot point for our democracy. I believe that we should give resources for more podcasters, bloggers and vloggers to be able to operate – they are another important opinion in our media landscape.
The time is ripe to get all stakeholders around a table; academics, policy makers, politicians, civil society led by the President of Malta and have an ongoing conversation on this sector. It is only by having this ongoing debate that we can ensure that the ship is being steered in the right direction and responds to the needs 'out there'. I also recommended that when it comes to the political manifesto the social section of the electoral programme should be common for all parties to ensure we have a comprehensive non-partisan vision (Clement, 2016).
<i>Service provision</i>
Professionals in the social and mental health sector should not over-price services and support for people who are in a vulnerable position and unable to contest or refuse to get services because of the cost this incurs.
We should recognize that suicide is nothing less than a failure of society to reach out to a call for help.
People who go into the social care professions need to be ethical, have a vocation and be driven by the cause – if it's just the wage or the power they're after, they're in the wrong place.
Our Judiciary should have a sentencing policy, should not succumb to media pressures and should be just, equally and always.
Solitary confinement should be completely abolished from our criminal justice system.
That the prison system should be dismantled, and the criminal justice system re-invented. It's taking in water from everywhere. Justice is not being seen to be done. Prison should be about 'love' (in its widest of interpretations) rather than retribution. Sorry but those who currently manage the system are not fit for purpose and they have failed the State.

Fig. 1 (continued).

Eating disorders need to be addressed nationally. The problems we are witnessing in this area are of mammoth proportions (Times of Malta, 15/10/2020 – Accessed on 21/10/2022).
The Faculty for Social Wellbeing within University should remain a voice for the voiceless – this is as important as training good professionals in the various areas of social care.
Facebook and Instagram should be flooded with positive messages and used as an emancipatory tool especially for disadvantaged groups who do not have the same degree of power and positioning in our society.
We need freedom of speech but that does not give us the right to abuse others, especially in the world of Facebook. There's something called honourable behaviour. Agree, disagree – that's fine, but respectfully.
Politicians and businesspeople should register their meetings and declare their interests. Once they start consorting it's a disaster. We've seen it happen in the past and it keeps repeating itself. I also believe that our politicians should not focus on the gains but on the pains. Political parties should stand by their values, not only respond to their quest for popularity. I also believe political parties should reinvent their social ethos – where has it gone?
We also need to have Community Development Workers placed in every locality governed by a Local Council so that we can keep understanding what is happening in our communities and how we can address the day-to-day issues.
We should also be reviewing our social benefit system to ensure we are not creating dependency. We also need to tackle the issue of benefit frauds with even more determination.
We need an improved mental health strategy and a new hospital suitable to the needs of the people who need to use it. We need a policy and strategy on suicide and need better trained personnel and the right infrastructure to support first responders who either go through difficulties themselves or people who are victims.

Fig. 1 (continued).

attempted to commit suicide twice; one of them being by driving his car at full speed into a wall, hoping that this attempt would “succeed”. Luckily it didn't, and he came out of that experience able to tell us about it albeit he remained impaired. The daily challenges he has had to face are a massive burden and digging in and trying to find scope and confidence does not come easily for David. He says that he is not always grateful that he survived his attempted suicide, but also reiterated that there is a lot to live for. Still, the overwhelming feeling of depression or hypomania keeps getting in the way. It is his determination that pushes him through the next stage in life.

David Spiteri Gingell, who was diagnosed with bipolar II some 20 years ago said “the surest way of keeping you afloat and not get lost in society is to surround yourself with people who are willing to help you. And this can only be done if you're open about it ...”

Speaking on Andrew Azzopardi's talkshow on 103 Malta's Heart, Spiteri Gingell said that unless people with mental health issues open up about their daily struggles, the people around them will not be able to understand what they're going through.

The Story of Marilyn

Marilyn is a young person who has struggled with anxiety for years. She is a highly talented media producer. She speaks about the struggle to tackle each moment and getting through one day at a time. She claims that faith in God is what sustains her and helps her to process the struggles. She says that in her mind she is in a constant state of struggle and at times she is literally unable to get herself out of bed with the intense anxiety that grips her. For her, each day brings more low points. She says that she values friendships immensely and that her work colleagues are pivotal in accompanying her as she gets on with her life. The way society at times deals with her is not always optimal, but with the help of those around her she walks through the haze and keeps finding the right doses of energy to take on the next challenge thrown at her. The strength of character of this woman is inspiring.

The Story of Louisa

Louisa's story is one of immense pain that challenges belief. She spoke about the incident that defined her over 17 years ago when her daughter Jessica was crushed under the weight of a school van (bus) that had just returned her other child. Louisa spoke of how this incident led to the instant death of her 21-month-old daughter and how it marked her for life. She found solace in her friends, in her family and also in God.

The first thing she did was to embrace the driver who ran over her daughter. I'm shocked. This wasn't the end of it. A couple of years after, she and Philip, her husband, had another son who was diagnosed with down syndrome. Louisa knew that the pressures loaded on her by a society which is ableist would increase her burden. She was never one to buckle in the face of challenges imposed by society, but Louisa knew from day one the constant demands and expectations and air of selectivity in our community would create endless troubles for her son with down syndrome. She was and still is immensely resilient but knows well enough that she and her family had so many obstacles to tackle. Louisa's mental reserves helped. This mother of immense strength has been instrumental in providing for the best possible quality of life for her son Ben who is now semi-independent, has his own friends and work colleagues and has *joie de vivre* like no other. What Louisa kept stating was that it was society that becomes the biggest problem in all of this. The birth of her son with down syndrome confirmed the intensity of her love. Society is not only very selective, but also deeply discriminatory. She and Ben faced another challenge. They had to deal with further judgment and social hostility when Ben came out as a gay person. She says that the wedding of her son to his partner surfaced love beyond words. She claims that she has never witnessed such exquisite beauty before in a wedding. Louisa sums up these intense stories by saying that notwithstanding the death and the pain and suffering she had to endure, she felt God was close to her. In fact, nowadays she remains actively involved in Drachma (a support group) and speaks regularly about her story (Curtin et al., 2015).

The stories of these three people are salutary. They show what humanity is made of and infers how our social policy should respond. These stories reveal the nuances that our social policy struggles to deal with. Considering the estimated 7 billion euros we throw into social policy every 5 years (the term a government spends in power) confirms the reality that the return on investment is not what is to be expected. When we still contend with endless social problems like lack of standards in services; problems with loneliness, which reflects various shortcomings, namely flailing communities, lack of communication and networking which formerly was at the heart of our society and an increase in a neo-liberalism which drives people to focus more on their own pursuit of wealth rather than taking into cognizance the needs of the community. In a number of research projects, the Faculty for Social Wellbeing was involved in (<https://www.um.edu.mt/socialwellbeing/ourresearch/researchprojects>) to try and respond to the growing complexities of making our communities function equitably we have surfaced a number of issues that require our immediate attention.

To compound all of this in a document collectively authored by the Faculty for Social Wellbeing (https://www.um.edu.mt/_data/assets/pdf_file/0009/485343/FacultySocialPact_Printrevised.pdf), *A social pact* (2021) I find this quotation to be particularly significant;

Inequality in Europe was described in a 2017 OECD report as reaching its highest level, with the authors stating that "the 10% of wealthiest households hold 50% of total wealth; the 40% least wealthy own little over 3%" (p. 6).¹ Within Malta this has translated to over half of the wealth belonging to the top 10% of the population. ² The share of workers at risk of poverty is on the rise, compounded by the effects of the ongoing pandemic and its aftermath (2021: 9).

In pursuit of social justice—manifesting my thoughts

My guiding purpose has always been the pursuit of social justice. David, Marilyn and Louisa embody what our social policy should look like and encapsulate. Their stories have motivated me to come up with a Manifesto of proposals. With these three protagonists it isn't just an issue of resilience, or of facing their challenges. They are more than that. They reflect the faults in the system, the selectivity in our social governance and the fact that people, many of them with low social capital are short changed. In my role as a volunteer, a social operator, activist, practitioner and academic, I have sought to work toward "good community" (Gilster, 2012). Notwithstanding the fact that I am an agnostic, my Jesuit education, which I am proud of, implanted in me this sense of "social justice" which sits above everything else. Nevertheless, the abuse, the criticism and the attempt at cancellation I persevere knowing well-enough that social justice comes at a price. It is also comforting knowing that in the pursuit of social justice I am not alone (Alessandrini, 2011).

Today, however, social protection is one of the major demands of social movements all over the world. But what kind of social protection? Do we have to (re-)build the damaged or incomplete welfare states? Do we agree with the new international agenda? Or do we want to develop our own vision and programmes? We claim it is not enough to just ask to have access to health care, we also want people to have a possibility to live healthy lives throughout and to participate in the decision-making. This means we broaden the concept of social protection; we link it to democracy, the environment and trade and we integrate it into the thinking on commons. What we propose is a truly innovative approach, a long-term agenda for contributing to system change.

Mestrum and Menon (2021:12).

Following Mestrum and Menon (2021), this chapter asserts that the reinstatement of “social protection” is a prerequisite for building community. The remainder of this chapter outlines my *Manifesto for an Inclusive Community* of how the social sector should evolve based on the following components:

- Community participation;
- Liveability;
- civil society;
- social policy actions;
- social governance;
- values;
- service provisions.

The reflections I offer represent an attempt to make social policy effective and comprehensive through a more judicious use of resources to build inclusive and supportive community.

An issue that merits our intervention is the issue of social exclusion and poverty. To do this we need all the possible help from Non-Governmental Organizations (NGOs). NGOs must work for the persons they represent and not the other way around (Rodekamp, 2013). The relevance of NGOs lies in the fact that they are autonomous from the agenda of the Government. Their focus remains the cause they represent, and they frame the needs of that minority to truly represent them.

The issue of justice has been raised in the field of geography from time to time in regard to globalization, suburbanization, gentrification, and immigration processes. In this context, the question of fairness has spurred a growing literature that theorizes justice in space (Fainstein, 2001). This rise in interest, though, seems to skip the basic question of what we should seek in order to measure justice (Israel and Frenkyl, 2018: 649).

Naturally civil society is fundamental to ensure that the nuances and contentious discourses of oppressed communities are brought up and tackled through a strong insider voice. The money that the Government and the EU institutions give to NGOs shouldn't become simply a carrot or means to sway the agenda for political ends. We should set up an autonomous *Foundation* so that the financing that the government gives will not go directly to the organizations and associations, but it will be the responsibility of the *Foundation* to direct the monies to the projects that are most deserving. This will ensure autonomy rather than dependency on the Government. There should also be transparent criteria and we should also encourage social enterprise to minimize dependency on the Government for resources.

The issue of social leadership and social governance is problematic. We have a dearth in leadership whether it is in public entities or NGOs and authorities. This is a crisis that overwhelms us and has left gaping holes in the sector.

Lessa et al. (2014).

However, discussion of the metric by which we can measure justice regarding its social consequences has been lacking. Current writings that discuss the relationship between space and justice give little attention to what constitutes well-being in the first place, thus lacking normativity (Olson and Sayer, 2009; Israel and Frenkyl, 2018: 647).

Conclusion

Defining social justice is not easy, and it remains an “under-theorized concept” in education. One conceptual issue is that social justice is an umbrella term with multiple meanings. Blackmore (2009) states that social justice “encompasses a range of terms—some more powerful than others—such as equity, equality, inequality, equal opportunity, affirmative action, and most recently diversity” and, further, that each term “takes on different meanings in different national contexts” (p. 7). Boyles et al. (2009) add that “due to such widely varied meanings [of social justice], it is possible for different groups to act in opposition to another, yet each can do so under the aegis of social justice” (p. 37) (Furman, 2012: 193).

The purpose of sharing these ideas is to help place the social sector back on the agenda where it belongs and through out-of-the-box-solutions address some major issues we must contend with. As academics and inclusive educators we are duty-bound to keep providing elucidations to very complex problems. This has to happen through a mélange of lecturing, research, dissertations, our social engagement and reflection as we go about our professional duties and life journey (Bee and Guerrina, 2014).

The University of Malta, especially the Faculty for Social Wellbeing, should offer more empirical data and research. If we want the sector to have tangible solutions rather than populist knee-jerk reactions, we need to invest money for research in this sector. Having said that in these last 4 years the Faculty has contributed to over 45 research projects commissioned by various NGOs and government and private entities. These projects have contributed directly to policy development, contribution to public debate and have influenced the design of legislation (<https://www.um.edu.mt/socialwellbeing/ourresearch/researchprojects> - Accessed on January 22, 2022).

The term “social dialogue” implies that in the process of globalisation, where neoliberal ideology has established its dominance, social struggles have moved away from the context of the contradiction between labour and capital to find a new platform of class compromise and cooperation. Yet it is debatable as to whether this idea of a shift has objective grounds or not. There is a need to go back a little in order to correctly read recent transformations in industrial relations. This will make it possible to clarify how the aforementioned discourse emerged, together with its context.

Akpınar and Akçay (2015: 438).

Finally, I encourage our communities to reignite a passion to talk to each other and to have each other's back. We also need to connect with the strategies which worked in our communities in the past.

Within the social space, the effectiveness of different forms of capital emanates from the organization of the social world into fields (e.g., the economic field, the artistic field, the education field, and the housing field). All fields are internally structured in terms of (symbolic) power relationships, in which individuals and groups act in order to gain dominance and avoid subordination. The effectiveness of the application of the different forms of capital for different social benefits depends on contexts and people's abilities to “play” their capital most effectively (i.e., applying symbolic capital).

Israel and Frenkyl (2018: 652).

Introduction

How disability is framed and what sort of orientation these frames invite, has much to do with the kind of disability studies we end up doing, or even if we do disability studies at all. As a way to show how these frames work, the issues they invite, and how these frames change, I will explore material produced and widely circulated by the World Health Organization (WHO). Frames matter and every time disability appears, it appears through an interpretive frame. Perceiving these frames is very important for revealing the complex imbrications of disability and society.

I make use of the WHO’s “Key Facts” on disability as an example of framing disability in a non-disability studies way that depicts disability as an individual and medical problem. I show how disability studies re-frames this conventional way of perceiving disability, problematizes conventional frames, while also showing how disability can be framed differently through disability studies. While there are, as Goodley (2011, 48) says, a plethora of “diverse disability studies” frames, this article pursues only two – first, the social model of disability including debility studies and, second, a more intersectional frame that emphasizes the relational character of all disability representations and experiences.

This article ends with a discussion of the different ways of doing disability studies and how these ways frame both the meaning of disability as life and the possibility of social change when we start from disability-as-life as the grounding assumption. I will show that what arises from the recognition of a diversity of frames is the necessity of a self-reflexive politics with disability experiences, which should include the ways we do disability studies. This diversity of frames can be read as an invitation not only to know these frames, but also to reckon with the in(ex)clusions each frame enacts as we grapple with the social and political consequences of a particular frame (Ware, 2005).

The orientation of frames

Depending on which way one turns, different worlds might even come into view.

(Sara Ahmed, 2006, 15).

The truth about stories, is that that is all we are.

(Thomas King, 2003, 2).

How we orient, that is turn toward and frame our bodies, minds, senses and emotions has much to do with how we understand, experience, and work with – or against – what comes to be called *disability*. There are some ways of orienting and thus framing disability that will never lead a person into the world of disability studies. Whatever else disability studies might be, it does not frame disability as an individual organic problem in need of individual remediation.

Framing disability as a problem to be solved at the individual level does lead back, however, into the common-sense world where there is a taken-for-granted assumption that there are “normal” and “expected” ways of being in the world. Some people fall outside of this common-sense world and its expectations because, it is assumed, something is wrong with them. Disability framed from within the perspective of the “world of the normals” (Zola, 1993), can do many things, including learn about disability-as-dysfunction and provide solutions, but this is not the same as doing disability studies. Individualizing frames can conduct a *study of disability* such as providing information about conditions. Disability studies, in contrast, focuses on the

relation between everyday norms and the appearance of disability and can reveal how those everyday norms organize how disability is perceived — that is, framed (Titchkosky and Michalko, 2009, 5).

From the premise that there is a distinction between the study of disability and disability studies, I turn to a World Health Organization (WHO) representation of disability and reveal the non-disability studies frames used to generate it. I reveal the disability studies *frames that themselves reveal the frames* that allowed for the making of the WHO’s (2018) “Key Facts” on disability. Perceiving the frames that make disability appear in one way rather than another is an activity that can be understood as important to disability studies.

Key facts and the objectification of disability

If something is to be constructed as a fact, then it must be shown that proper procedures have been used to establish it as objectively known. It must be seen to appear in the same way to anyone.

(Dorothy Smith, 1978, 35).

The presentation of *key facts on disability* has a long lineage. It has been reproduced over time, around the world, through national and local government agencies and replicated by many disability organizations. The WHO’s tradition of representing disability in this way has been occurring, in various forms and figures, decades before 1981 — the year designated by the United Nations as the International Year of Disabled Persons. Post 1981, the production and distribution of disability key facts became nothing short of common-place. This prevalent representation of disability via key facts highlights the taken-for-granted character of this traditional way of framing disability within Western cultures. The production and circulation of key facts tells the story that people believe that there are facts on disability to be had, some of them key, and that they are already available and should be widely distributed.

Consider WHO’s representation of key facts on disability (or search on-line for an updated version of such facts) (Fig. 1).

Key Facts on Disability

Key facts

- Over a billion people, about 15% of the world’s population, have some form of disability.
- Between 110 million and 190 million adults have significant difficulties in functioning.
- Rates of disability are increasing due to population aging and increases in chronic health conditions, among other causes.
- People with disability have less access to health care services and therefore experience unmet health care needs.

The International Classification of Functioning, Disability and Health (ICF) defines disability as an umbrella term for impairments, activity limitations and participation restrictions. Disability is the interaction between individuals with a health condition (e.g., cerebral palsy, Down syndrome and depression) and personal and environmental factors (e.g., negative attitudes, inaccessible transportation and public buildings, and limited social supports).

Over a billion people are estimated to live with some form of disability. This corresponds to about 15% of the world’s population. Between 110 million (2.2%) and 190 million (3.8%) people 15 years and older have significant difficulties in functioning. Furthermore, the rates of disability are increasing in part due to aging populations and an increase in chronic health conditions.

Disability is extremely diverse. While some health conditions associated with disability result in poor health and extensive health care needs, others do not. However, all people with disability have the same general health care needs as everyone else, and therefore need access to mainstream health care services. Article 25 of the UN Convention on the Rights of Persons with Disabilities (CRPD) reinforces the right of persons with disability to attain the highest standard of health care, without discrimination.

WHO (2018), fact-sheet [Accessed Oct 5th, 2020].

The global distribution of this text (Fig. 2) itself lends weight to it as a legitimate factual representation of disability. The WHO logo assists in framing the facts as objectively just-there, obvious to any reasonable person who encounters them. The WHO logo or emblem, developed in 1948, is a protected image to be used only with permission from the WHO. The emblem is comprised of a globe overlaid by an ancient symbol of medicine, which is a single serpent entwined rod wielded by the Greek god of healing and medicine, also known as the rod of Asclepius. The globe is intersected by lines in all directions and wreathed by a bay of laurels, suggesting that the WHO holds a crown of victory in its race toward health. This emblem appears, frames and endorses what comes next, namely, facts, and key ones at that, that depict disability as a problem of global proportions.

Fig. 1 Key facts on disability

Blessed with the WHO’s authority, disability is framed as straightforwardly a problem, just there, objectively given and obvious to all. The opening four key facts on disability communicate that disability is readily observable and quantifiable — it appears as a billion individuals who have trouble in functioning normally, and who comprise a large population, a population that is further affected by aging and ill health and who face a variety of unmet health-care needs. This fact sheet, circulated around the world in a variety of languages, suggests that this is how disability should and does reasonably appear to anyone, anywhere, regardless of context. The key facts, both in short-form bullet points and in full sentences, communicate that there are more than a billion people with disabilities and of those people tens of millions have difficulty functioning. Disability is framed as a taken-for-granted, obviously recognizable problem of lack of function with significant individual and global impact.

The authority of these key facts lies, in part, in not showing that they are human artifice; administrative inventions. Instead, they are made to appear as springing from the seemingly objective knowledge and power of the WHO as it addresses disability as naturally a problem. Providing numerical facts covers over the social fact that this knowledge, including numerical renderings, is made and makes up a particular meaning for disability.

After the bullet point facts and prior to their further explication in full sentences, we are provided with a definition of disability. Sandwiched between fact-statements, this definition is presented as the proper reasoning behind the key facts. The use of this definition is presented without the need for documenting or identifying the people located somewhere who decided on its use and placement, and without mentioning the history of its development. There is, for example, no mention that in 2001 this definition replaced many other definitions of disability previously used by WHO, (WHO, ND. ICF). Instead, the definition is positioned as the proper non-subjective understanding of disability by invoking an authority, namely, “The ICF defines ...” transforming the name of the definition (ICF) into the definitive depiction of disability itself.

Stripped of signs of human artifice and deliberation, the ICF definition of disability is made to appear as objectively given, as are the facts that proceed and follow it. The definition, like the facts, arises from no one in particular enabling an authorial power as though without the involvement of anyone. Even though the ICF definition mentions personal and environmental factors, no information about these factors appears in the facts provided. Instead, individuals with problems with functioning are enumerated — 15% of the population of the world, or one billion people, have a disability that is expressed in such a way that makes poor health appear as the primary meaning of disability on a global scale. In this sense, the WHO Key Facts on Disability reads as if it offers a direct glimpse at the reality of disability — poor health outcomes accompanied by difficulty with functioning.

While it may be that fact sheets are produced with the explicit interest of raising awareness, what we are made aware of is something that we already know at the level of unexamined common-sense—disability is an individual problem perhaps bigger than we first thought. Disability as a collective issue is pushed out of the frame and supplanted by a personal search for individual adjustments and personal care, at times through the acquisition of rights to care and, at other times, through individualized programs of support and even charity (Schlund-Vials and Gill, 2014; Kelly, 2016). Non-disability, understood as the norm, frames disability as an individualized personal issue that often makes it into a matter of sheer survival. However, this framing does not mean that disability is restricted to the singular issue of survival. What it does mean is that contemporary Western culture is itself deliberately restricted in the ways it attributes meaning to disability (Goodley, 2021).

Defining disability as objectively given, measuring its severity, discerning its prevalence, planning for its remediation are conventional ways of studying “health conditions” and provide a frame for the interpretation of disability and disabled people as dysfunctional. And, yet, without a frame that includes the reflexive understanding that disability is framed, we remain outside of a disability studies orientation. *Disability studies* grapples with *how* disability is made an issue, that is, with how disability is perceived and with the frames that make that perception possible.

Perceiving the frame—social model and debility studies

... Disablement has nothing to do with the body. It is the consequence of social oppression

(Oliver, 1996, 43).

Disability is a profoundly relational category, always created as a distinction from cultural ideas of normality, shaped by conditions that exclude full participation in society of those considered atypical

(Ginsburg and Rapp, 2013 54)

“Debility” [is] bodily injury and social exclusion brought on by economic and political factors.

(Chiayulien, 2020)

When framed by the social model of disability, disability is not perceived in individuals but, instead, is perceived in the interaction between inadequate and inappropriate responses to people with impairments, transforming them (us) into disabled people (Oliver, 1996). Disability is not some unfortunate biological happenstance found in people who are counted and measured.

Yet, the WHO frames disability in this way. The question becomes how might the social model *frame* non-disability studies frames of disability? Let us engage this question by returning to the WHO.

The WHO's Key Facts on Disability, perceived through the frame of the social model of disability, reveals the various ways that disability is *made* into an individual problem. The WHO tells people the facts on disability and does so by omitting, suppressing, oppressing the contravening social fact that “disablement has nothing to do with the body” (Oliver, 1996, *ibid.*). WHO's fact sheet, moreover, makes it seem as if there is a direct relation between bodies, minds, senses, emotions and what comes to be experienced as disability. But such a direct relation to embodiment is a myth.

Even a slightly more social perspective can make us take note of how people's experiences always happen somewhere and in the midst of others; in relation to the knowledge regimes, interactional norms, and physical and institutional environments that combine to make up the context of any individual's appearance as disabled (Titchkosky, 2007, 17). The fact sheet covers over the “fact” that disabled people appear in locales that cause disablement by suggesting that disability can be counted and thus known as an individual condition regardless of context. How we frame disability, then, has consequences not only for how disability is perceived and understood, but also for how it is lived. For example, “What is wrong with you and what do you need?” is one way to live with disability that fits neatly within the WHO frame; whereas asking “How's the community treating you?” is a question arising from a social model frame.

To produce facts on disability as if individual lives can be abstracted from the social and political relations that produced them maintains an unjust relation to disability and is part of the process of oppressing people with impairments, insofar as such facts represent and reproduce an ideology of individualism. This ideology is at work when individual selves are framed as the locus of the issue of disability and where the self is perceived as a task and project. This is what various social theorists call “individualization.” Bauman, for example, describes it as a key social process for the workings of contemporary capitalist social organizations, which he characterizes as both destructive and wasteful (Bauman, 2000, 30–38, 2004). Conrad (1992) characterizes this as medicalization. Framing disability as a personal problem of dysfunction participates in the on-going individualization of the self under contemporary societal conditions. Individualization as a constant demand of normalcy is reframed by disability studies as itself a phenomenon in need of inquiry.

The social model of disability frames disability as *social*; that is, a result of its relational contexts. The WHO frames disability as “the interaction between individuals with a health condition ... and environmental factors.” This interaction depends upon the tacit understanding that disability is already an individual calamity. Framing it in this way, conceals the complexity of disability's “profoundly relational” character (Ginsburg and Rapp, 2013, 54). Providing facts on disability can now be understood as a process whereby social structures continue to transform people with impairments into individual problems. Enacting the objectification and decontextualization of disability are processes that work to define the reality of disability. Facts are thus not a snapshot of disability reality but are, instead, a form of social action *making* a reality for disabled people.

The question of what we are doing when we perceive and represent disability in whatever way we do requires that we engage with the profoundly relational character of disability and there are many ways to do so within disability studies. While those who perceive disability through the frame of the social model suggest that acts of individualizing and decontextualizing disability can be read as a collective failure to respond appropriately to people with impairments, others, such as Jasbir Puar (2015), suggest that it is a collective failure to respond appropriately to wars, capitalism and colonial occupation that debilitate people. Let us explore the concept of “debility” further.

Puar suggests that “in this historical moment” many approaches “face the rise of disability as a recognized vulnerable identity in need of state and global human rights protections,” thereby propagating a notion of disability as “a socially maligned condition that must be empowered to and through a liberal politics of recognition” (Puar, 2015, 9). To seek recognition confirms the power of those structures that grant such recognition, suggests Puar. Perhaps this is why she says that in seeking human rights protection, pride, or pursuing other forms of disability politics disabled people are tacitly confirming the validity of the structures that also launch war, reproduce capitalism and seek to colonize. These are structures and activities which produce bodily injury and social exclusion. Puar suggests that a focus on debility requires a reevaluation of what we are doing when we notice disability and seek improvements:

This revaluing of excess/debility is potent because, simply put, debility – slow death – is profitable for capitalism. In neoliberal, biomedical and biotechnological terms, the body is always debilitated in relation to its ever-expanding potentiality.

(Puar, 2011, 153).

Understood through the debility frame, disabled people seeking their recognition as vulnerable and in need of individual rights end up confirming the power structures that resulted in debilitation in the first place. The debility frame suggests that the current state of affairs excludes and maims people in order to perpetuate order and organization – debilitation is the norm. Puar goes on to suggest that much disability-politics does not take into account how it/they/we perpetuate the process of debilitation and in so doing further debilitate disabled people, especially those located in the global south.

Given that nation state organization is meant to serve capitalist interests, it is profitable to recognize some disabled people as vulnerable and in need of inclusion into the workings of society via individualized rights and accommodation procedures. Still, these procedures of inclusion and recognition will not, according to a debility frame, disrupt the “maiming” of people for the

sake of the on-going reproduction of capitalist power, control, and gain. The WHO facts, framed by a debility perspective, can now be read as serving state control by functioning as an apparatus for convincing all people of a particular way of perceiving disability that serves the reproduction of state power.

With debility as a conceptual frame, disability appears as a vulnerable rights-seeking group that, through a politics of recognition or pride, continues to allow for capitalist regimes to pursue the right to maim, debilitating people of color and other marginalized groups, including disabled people. A politics of recognition can give rise to liberal disability pride or rights, but does little to reveal how the majority of disability in the world is generated by wars, capitalism and colonial occupation. Current regimes of power manufacture disability, including facts about this vulnerable identity group, and in so doing continue to secure their power. Thus, Puar recommends changing the frame from disability as an individual thing, to debility as process – a state of affairs brought on by economic and political structures that benefits those same structures. Disability, from this frame, is manufactured for and by ruling powers.

From within the frame provided by the social model of disability and from the frame of debility, objectified versions of disability appear as something quite different than a biological reality from which information can be gleaned. Framing disability as an object can now be understood as an instrument of individualization and even as serving the aims and interests of capitalist regimes. And, in the contemporary West there are many ways to frame disability that prop up the requirement that disabled individuals adapt and/or pursue individual rights within the system of power, such as it is. Further, the framing of disability as an objectively given individual problem serves to keep disabled people, or perhaps all people, from thinking about how their existence – even when understood as unjustly produced – is a symptom of wider systems of oppression such as colonialism, an ever-growing capitalism, and the wars and conflicts that make profit for few and debility for many.

We have at least two frames of disability that are fairly recognizable. One, represented by the WHO, makes disability primarily appear as biology gone wrong. The other, represented by the social model of disability and debility studies, makes disability appear as both a sign and a symptom of what is wrong in society. This conflict of interpretations is what I turn to now, a conflict that may, upon reflection, once again, change how disability is framed.

Life with conflicting frames

Well, I suppose that's the point at which one would have to ask why stories get told in those ways. Let me make the point that if you tell a story in a particular way you often activate meanings which seem almost to belong to the stock of stories themselves.

(Hall and O'Hara, 1984, 7).

During an interview with John O'Hara regarding the narrative structure of *reality*, Stuart Hall (Hall and O'Hara, 1984, *ibid*), a founder of cultural studies, suggests we should ask why lives and issues are framed by “a set of ways of telling stories that are immediately recognizable to the audience.” Disability, like many other ways of attending to life and people, is discussed in immediately recognizable ways. It is framed so as to appear as a set of stories of individual trouble at the biological level and it is also framed as the oppressive or debilitating nature of social order. Both frames are readily available and recognizable ways of activating meaning for disability. These frames, their meanings as well as the conflict between them—the nature/culture divide—belong to Western culture's immediately available taken-for-granted stock of stories.

These sets of stories framing disability as either all-biology or all-social-oppression are not only available and recognizable, but easily drawn upon by all of us. Indeed, I feel the movement of these set stories in my life, and sometimes simultaneously. When words, time, directions get mixed up, I claim the frame of dyslexia as a biological limit; when others don't respond with some generosity of spirit to these mix-ups, I feel my exclusion and belittlement rising due to their oppressive reaction. As I tell this story, I can also think that mere mix-ups can't possibly be an issue of concern when COVID-19 cases are surging, killing those people most debilitated by oppressive structures of a capitalist order still turning a profit for a few in the global health care industry. Disability framed as all-biology or as all-social-oppression are stories at the ready, belonging to the stock of stories of contemporary Western times. We can orient to these stock stories and examine how they have the power to give shape to thoughts, feelings and actions.

As Hall goes on to discuss the issue of stock stories, the question is not so much whether the stories are good or bad, but rather concerns himself with what they do. That stories, especially readily recognizable stories, are agentive gives rise to a concern about how such stock stories function. Hall (Hall and O'Hara, 1984, 9) suggests that these stories are not innocent insofar as “They underpin, they undermine, they reinforce and strengthen those sentiments, those ways of understanding; and ... by definition undermine, weaken, make less powerful and important the alternative ways ...”. His concern with stories does not end with their capacity to repeatedly provide frames of reference that emphasize or displace significance. Instead, Hall emphasizes the need to attend to stories as makers of reality that undermine alternatives and, maybe, even alterity itself. That I can, for example, experience simultaneously various meanings of dyslexia leading to confusion instead of certainty, harbors the possibility of an alternative, namely that dyslexia is a form of consciousness meeting the world in unexpected ways.

The need for critical engagement with the fact that stories do form realities, is also expressed by Bauman (2004). He speaks of this issue in many ways. Here is one:

Stories aid the seekers of comprehension by separating the relevant from the irrelevant, actions from their settings, the plot from its background, and the heroes or the villains ... It is the mission of stories to select, and it is in their nature to include through exclusion and to illuminate through casting shadows. ... Without selection there would be no story. To say "this would be a fine story if only it did not skip this or that" is like saying "these would be fine windows for seeing through the walls if they were not framed and kept apart by the walls between them".

(Bauman, 2004, 17).

Regardless of what the stories leave out or fail to account for, they still frame a reality and have power to order our lives – "their mission." Bauman's sense of what stories *do* shares Hall's orientation, in that both suggest that stories do much by way of weakening and strengthening forms of comprehension acting to frame what comes to be perceived as necessary and important. Understanding stories as makers of reality, even with their limited and limiting frames, suggests that what is necessary for critical inquiry is a commitment to generating self-reflexive relations with stories.

Following the sense of story as agential, it becomes important to notice that it's not just about telling ever better stories. That is, while the WHO might be asked to include more health conditions for the story of disability as biology, or the Social Model of Disability might be rebuked for not conceiving of debilitating barriers in a more global fashion, this sort of critique leaves the frame in place by asking only for its expansion. Expanding the frame is not the sort of critique that Hall is suggesting.

In the face of the understanding that stories frame reality, Hall continues to critically engage them by asking what the story can take into account, including whether it can take into account its own frame of reference. Framing the frame means, as Hall suggests, cultivating a concern for stories that does not end with their power to reinforce and to undermine. Joining Hall in this way of understanding stories means figuring out what has been done by the stories we have already told, the stories we inhabit and the ones that live in us, that live in our patterns of thought, ways of imagining and forms of perception. This is a theme occasionally reflected in disability studies too as, for example, when Stiker (1999, 15) suggests that "To initiate an analysis of the social workings of disability by way of its integration is a method more critical, even more militant, than to address it in terms of exclusion."

A narrative orientation launches the methodological necessity to continue to seek out whether or not a story demonstrates a self-reflexive character with its own power to utilize a stock story, that is orient to its own frame. Hall puts it this way, "Is it [story] going to acknowledge *that* within its frame of knowledges?" (Hall and O'Hara, 1984, 3, italics my own). This is very different from suggesting one story is true and the other is not; or suggesting that one story is just and the other not; or that it's just a story, not too relevant, just let it be. Hall offers neither the judgment of objective truth or falsity, nor a subjective judgment that its "just a story" of a particular person with interests and biases. Insofar as all stories create a reality and rely on a stock of stories already told and ways of making sense already made in order to do so, the question becomes, how does the story narrate its own frame of reference, its own way of framing thus creating a reality?

Framed by the World Health Organization (WHO-as-storyteller), the story of disability appears as all that can go wrong with one's biology compounded by the political and social environment. Framed by the social model and by debility studies, in contrast, the story of disability appears as all that can go wrong with societal organization both in its failure to respond and in its success to control, compounded by individual experiences of impairment, injury, and accident. Whether indicative of individual or social pathology, in both cases we have the story of Western culture with its belief in a nature/culture divide as one of its origin stories but without offering a reflection on *that* divide as it is made and remade into a key cultural reality for our lives with disability.¹

The simultaneous appearance of multiple frames may be and often is confusing. It is tempting to remedy this confusion by committing to a single frame that, given the context of the situation and of individual interests, is easier to comprehend and feels truer. Still, the existence of multiple frames provides for the possibility of disrupting the certainty of what we know and perhaps forging alternative meanings and realities. Disability is, of course, more than a single frame can frame. In our discussions thus far, disability *is* and is *more than* the symbolic violence actualized by Western cultures' insistence on a nature/culture divide.

I turn now to an exploration of how perceiving multiple frames is a political necessity. How are multiple frames a way to de-naturalize our perception of disability as a thing born of a split between biology and society? And, what of the feel of embracing disability studies' frames that recognizes disability as a complex social phenomenon opening alternative possibilities?

Disability studies as framer of frames

Representations of disability, then, allow an interrogation of static beliefs about the body while also erupting as the unseemly matter of narrative that cannot be textually contained ... While disability as an experience is rarely narrated in terms of its own significance, disability as a metaphor allows writers to access concerns on a metaphysical scale.

(Mitchell, 2002, 17, 25).

¹For a more in-depth discussion regarding how an unquestioned nature/culture divide has influenced the formation of disability studies, see Corker (1998); Davidson (2016); Hughes (2019); Michalko (1998); Pickens (2019); Slee (2019); Stiker (1999); Tremain (2015); Titchkosky (2011).

A critical disability studies scholar asks difficult questions about the possibility of representation and accountability of scholarship and activism to all disabled people. And this new-found criticality questions some of the starting assumptions ...

(Goodley, 2018, 6).

Black Madness:: Mad Blackness furthers the conversations ... by fore-grounding the spaces where Blackness and madness become usefully entangled. My goal, however, is not to unravel them but rather to pinpoint the facets of their intertwining so that we might rest with the knots history and culture have created. This project attempts an intellectual cartography.

(Pickens, 2019, 11).

Let us try to “...expand the definition of consciousness beyond human/animal sentience by locating it in the world - a living agential co-responsiveness to the field itself; where the eye first opens.”

(Manning, 2017, 162)

To take responsibility for one’s writing and/or one’s reading, I would maintain, is to commit oneself to “read and write between the lines,” that is, to resist simplistic interpretations that dogmatically ascribe fixed significances to the words that appear on the printed page. And yet, it is not the case that “anything goes” ...

(Weiss, 2008, 58).

The above vividly demonstrates the grappling with multiple frames and their various parts, uses, interests, such as representation and metaphor; assumptions and questions; knots of history and culture; the intertwining of the perceiver and the perceived; or, what lies between the lines of what has already been read or written. But why grapple with various meanings and movements of interpretation that begin to appear when the focus shifts to multiple frames? Without this grappling, the multiplicity of frames disappear in favor of a one frame fits all reductionist comprehension on any human situation, including disability.

Resisting reductionist interpretations that dogmatically ascribe a fixed singular significance to disability raises the possibility that the unseemly matter of disability as either biological or social problem is, in fact, a complex life that erupts into the field of consciousness giving rise to concerns on a metaphysical scale. To interrogate stock stories and thus to ask questions so as to further conversations about our being co-responsive to the ways that disability is perceived, written and read about, or otherwise experienced, means working within a self-reflexive frame for doing disability studies. Such a frame puts into question some of the starting assumptions of analysis, for example, that we know what disability is and means outside of the knots of history and culture forming the field of consciousness itself where the eye first opens on disability or madness or any other anticipated but unexpected difference of the body, mind, senses, emotions, comportment.

Therí Pickens suggests that this requires an analysis that maps its own terms of engagement and the relations between these terms. This is similar to Gail Weiss’ suggestion that we read, and write, between the lines. It’s not that anything goes or that some kind of “*I think, I feel, I am*” now replaces a concern and engagement with the contested meanings of disability as a cultural phenomenon. Instead, any appearance, any way that disability is said to be, any experience of I think, I feel, I am disabled can be read as part of the “field”, as Manning puts it, from which disability arises and upon which it makes its appearance. Rather than providing facts on disability, such a frame *frames* how disability has come to appear as it does as a way to reveal something of the human condition, including the context of our appearances as disabled (or not).

Disability, moreover, cannot easily be contained within any fixed belief in biology or society since embodiment is a metaphysical issue that erupts into our thoughts, feelings and actions. For Goodley, this gives rise to a need to take into account our starting assumptions, what Manning might call the field where the eye first opens. It is not that we can untie the knots of history and culture that intermesh perception and the perceived, but we can, says Pickens, at least turn back and map or take responsibility, as Weiss puts it, for what grounds our entanglements with meanings already ascribed to disability.

Speaking of his life in blindness and the experience of its changing meanings, Rod Michalko puts these issues in this way:

... whatever is said about blindness, be it said by ophthalmology, rehabilitation, or by blind persons, *must* be heard as a depiction. Depictions of blindness can be judged for their vividness, their clarity, and their need to speak of blindness without being the final word ... Blindness is a reflexive phenomenon insofar as the *living* of blindness reflects a conception of what it is ... through conceiving life as a narration of the story of blindness. ... In whatever way blindness appears, we have a hand in making it do so. Those of us who are blind, and who relate to our blindness in a mature way, know that the appearance of blindness is a story and that we are responsible for its telling.

(Michalko, 1998, 155, 156).

A disability studies that is oriented to framing the frames, oriented to perceiving how and to what ends disability is taken-into-account, engages any depiction of disability as a depiction of life that may be judged as such. It is to regard disability, suggests Michalko, as a reflexive phenomenon where life and conceptions interweave forming a narration whose vividness is what should

be judged. Asking what disability depictions make vivid and clear and what they place into the background or make invisible is to ask what sort of story we are making with and through disability while raising the metaphysical question of judgment and even the question of ethics. In particular, it is to ask what it means to live with one depiction or another.

The framing of frames as a methodological trope for disability studies is not the addition of one more method or research technique. Instead of adding one more frame (or one more model), framing the frame acts to magnify, to bring into existential view, the sense that disability is life and is not best understood as a thing, be it biological or social in origin. The possibility of this self-reflexive engagement with an appearance of disability, in our own lives or in that of others, is to embrace, however tacitly, that disability is something other than dysfunction, needless suffering, and death. Framing that which has framed disability relies on some foundational sense that disability is quintessentially life.

By way of conclusion, I turn now to an examination of “models of disability”, models that themselves find their origin in disability understood as life. I show how these models, while framing the life of disability risk leaving that life behind in favor of emphasizing the life of the models themselves. I do this so as to conclude by sowing the seeds of the question — “What sort of life with disability do disability studies approaches invite?”

Conclusion – modeling the story of disability

The proliferation of disability studies models since the late 1970s can be understood as part of the orientation that *disability is life*, but once or twice removed from this experience, transmogrified into the more acceptable *Enlightened* idea of “model.” The development of the social model of disability, for example, occurred when groups of disabled people in the UK met to discuss employment schemes and disability allowances, the warehousing of disabled people in long term care homes, and their basic exclusion from the possibility of self-governance and participation in the wider social whole. Critiques of the treatment of disabled people in long-term care facilities with little to no control of their eating, sleeping, friendship or love meant that these disabled people began their discussions from the sense that there must be an alternative to how they were framed as useless sufferers (Hunt, 1966). Their critiques of institutionalized versions of disability started from the foundational sense that it could be different since, after all, disability is not only life but also a life worth living.

Discussions of the life of disability gave rise, eventually, to the social model of disability. This model enacted a sharp dividing line between impairment (what happens to one’s body) and disability (what society does to people with impairments). The model became a frame through which to perceive disability as oppression. Oliver (1996, 27, 23) reminds us, though, that “we must not assume that models in general and the social model in particular can do everything ...”, but it can be used to map “all the things that impose restrictions on disabled people.”

The proliferation of models in disability studies continues—social death model, social barriers model, administrative or bureaucratic model, minority model, social role valorization (SRV) model/normalization model, affirmation model, relational model, cultural model, affective model, *DisCrit* model, cultural affective relational model, consumer rights model, independent living model, universal model, the partnership model, and bio/social/spiritual model. The list is indicative rather than exhaustive. Whether one takes up any one of these many and ever proliferating models, it should be understood that a model *models something*, and that something is the beginning point for doing disability studies — namely, the acknowledgment that disability is life. Of course, acknowledging this life does not naturally, nor necessarily have to lead to a model.

While the formation and language of models may drink deeply from the waters of forgetfulness thus making disability a thing, people who use models had first to find life in disability before forging a model of disability. A commitment to any one model is itself a story of the Enlightenment belief that the subject of life (disability) and its objectification (a model of it) can be separated leading to a split between subjective experience of disability and objective knowledge about it *as if* this is a good way to frame life with disability. Regardless of the attempt to keep the split between subject and object² alive, any disability studies model of disability requires something other than dysfunction, death and suffering to ground its possibility.

This short story of disability studies models is meant to illustrate a key point I have been emphasizing throughout — beginning from the orientation that whatever else disability *is*, it is life and a way to re-encounter the interpretive frames that make disability appear as it does. What arises from the recognition of a diversity of frames is not the relativism that anything goes but, instead, the necessity of a self-reflexive politics with disability experiences, inclusive of the ways we do disability studies. It is in this sense that perceiving a diversity of frames can be read as an invitation not only to know them, but also to reckon with the in(ex)clusions each frame enacts, an enactment that invites us to grapple with their social and political consequences (McRuer, 2006). Thus, frames should be judged by their vivid and clear depictions of disability, together with whether or not they invite us to regard them as the beginning and not the final word on understanding disability. Changing the frame of reference means making the vividness of life primary within our accounts of disability. Such an approach does not, of course, mean ignoring social oppression. Instead, it means asking how we relate to, that is, live disability through our narratives of social oppression, or pride, or human rights, or any other frame.

²“Probably the chief gain of phenomenology,” suggests Merleau-Ponty (1945, xxii), “is to have united extreme subjectivism and extreme objectivism in its notion of the world or rationality.” The chief gain of Enlightened science can be characterized as opposite to this.

Frame > Reference > Consequences > Frame

Fig. 2 The interpretive chain.

In this article, I have worked from the assumption that the interpretive chain (see Fig. 2) is one way to proceed in disability studies and it is a way that aims to embrace a complex and lively relation between disability and society.

Such an analysis practices a *restless reflexive return* that resists the temptation to believe in progressive quick fixes as a way to figure out what we have made of disability/life when we say or do or write or read anything of disability (Titchkosky, 2011, 69). Changing the frames then begins with knowing that we are never without a frame and finding a way to engage our frames outside of habit or utility or worse estrangement. A commitment to seeking a way to frame our frames within the life of disability is to be at once vitalized by that life and to contribute to its vitality.

Glossary

Artificial Intelligence The theory and development of computer systems able to perform tasks which usually require human intelligence

Cyborg A person whose human abilities are extended by machines connected to the body

Critical disability studies An interdisciplinary community of scholarship, arts and activism that emphasizes the cultural, social, historical, political and economic constitution of disability

Disablism Discrimination against people on the grounds of their disabled identity

Humanism A system of thought that centers the concerns of the “rational” human

Life-limiting and/or life-threatening impairments Conditions which may result in shortened life span or sudden death

Matricentrism Centering on the mother

Narrative A story

Posthumanists Those concerned with the blurring of the boundaries between human and non-humans

Synthetic biology Branch of biology concerned with engineering organisms to have new abilities

Introduction

It has become impossible to think, write, act or deliberate without Covid-19 entering our framings of the world. Scholarship, research, innovation and knowledge generation are, understandably, locked into a direct relationship with the global pandemic. This chapter does not seek to ignore Covid-19, but it equally does not want to be defined by it. Instead, the pandemic might be viewed as an artifact of a posthuman age: where human troubles are tied up with those of the non-human world. The molecular, biological, human and societal are all intimately tied to the global and environmental. And the response to the pandemic has revealed very disparate experiences on the part of different human groups in distinct areas of the world. The individual body is clearly situated in a physical space. And these physical spaces, what we might have understood primarily in terms of locale or place, are increasingly virtualised as a consequence of the centrality of digital life. The 21st Century human being is a curious mix of biological/social, local/global, physical/digital, organic/technological. Posthuman theorizations are a response to this amalgamation; reflecting on the ways in which the human condition has become hybridized and anticipating contemporary and future mixes. In this chapter we will explore what it might mean to live in a posthuman age. We will introduce some key readings and writers and sketch out a representation of what some writers have termed the posthuman condition. Then, we will move on to consider the phenomenon of disability; and its relationship with the posthuman. Drawing on critical disability studies literature we will argue that disability constitutes the quintessential posthuman subject (Goodley et al., 2014): even though disabled people are often ignored in more mainstream articulations of posthumanity. Next, our discussion will turn to some of the potentialities offered by disability to thinking through the posthuman age. Our focus will move specifically to the lives of mothers of disabled children: as we excavate the many ways in which their human and non-human relationships provide possibilities of parenting and supporting their disabled children.

One obvious statement to add here is that posthuman studies are an intellectual response to the posthuman realities of our time. This understanding, though, emphasizes a rather circular view of knowledge production. If we were to accept the philosophical view

that knowledge constitutes the very phenomena about which it writes or speaks, then theorizations are better understood as having constructive qualities. Posthuman theorizations are complicit in the writing of and therefore the constitution of the posthuman world. As we seek to understand our interrelations with technology, animals, environments, robotics, digital contexts and science, then we not only unravel those interrelations but generate new understandings of them that may be incorporated into their very generation. Think, for example, of studying the relationship between young people and social media. The very act of exploring these relationships will ensure that we think anew about their complexities, their offerings, their pros and their cons. Empirical studies into social media not only give new insights, but also create new kinds of reflexivity, awareness and practical understandings about the functionalities, applications and consequences of social media. Posthuman studies are best understood then as offering accounts of—and interventions into—the posthuman age.

There is always a danger of embracing the speculative and sci-fi qualities of the posthuman. Cyborgs, Artificial Intelligence and synthetic biology are but some of the usual cast of subjects that are brought onto the stage of the posthuman. These characters are very seductive: not least because they plunge us into a host of utopian and dystopian tropes associated with the merging of human and science. Of course, these images compel us to think of the future: to anticipate what we might become. But any tracing of the posthuman age should also consider the present. And in the current epoch we might want to recognize the more mundane elements of the posthuman condition.

Posthuman disability studies

A posthuman world view is committed to recognizing and challenging the European renaissance philosophy of humanism (Liddiard et al., forthcoming). Humanism is predicated upon the fundamental desirability of the bounded, rational, autonomous and sovereign human subject, and is driven by an absolute certainty that human beings are capable of maintaining their privilege and species-dominance through rational thought, self-governance and progress toward objective knowledge (Goodley et al., 2014). The price of such progress has been paid by those who fail to live up to the desired humanist ideal and this has led to the creation of human, non-human and environmental collateral damage (Goodley et al., 2014). A posthuman approach encourages us to embrace ways of life that are not rigidly framed by humanistic values of independence and autonomy (Whitney et al., 2019). The posthuman condition opens up the possibilities for desires that are expansive, relational and nomadic, rather than narrow, individualized and fixed (Whitney et al., 2019; Braidotti and Regan, 2017). Crucially, in critical disability studies, posthuman thinking demands us to engage with *challenges* (barriers and inequalities) but, also, to think about *possibilities* in the lives of disabled people and families. A posthuman perspective draws us toward important relationships, resources and connections between humans and non-human animals, machines and environments (Goodley et al., 2014). It is a position that requires “the knowing subject disengaging itself from the dominant normative vision of the self” becoming “relational in a complex manner that connects it to multiple others” (Feely, 2019: 167). Making sense of these relationships, resources and connections demands that we develop an analysis that is sensitized to a “more-than-human” perspective (Monforte et al., 2019) as we explore what new insights can be gained, and how change can be affected, by thinking through (m)others’ and children’s entanglements with human and non-human animals, machines and environments in stories about their lives.

In this chapter, we expand the project of posthuman disability studies by thinking again about disability and family (Feely, 2019; Goodley et al., 2014). Thinking with posthuman politics and theory, we set out to explore the immaterial aspects (culture, attitudes and meanings) and material realities (structures, barriers and objects) in the lives of (m)others of disabled children. Writing from the United Kingdom, and in the midst of a global pandemic which has disproportionately impacted on the lives of disabled children, young people and their families (Runswick-Cole et al., 2020), we are acutely aware of the plethora of existing research focusing on the lives of mothers of disabled children. Despite this, over the last 30 years there have been limited im/material changes effected in their lives (Runswick-Cole and Ryan, 2019). The political and material conditions of disablism (the institutionalized rejection of disabled people) continue to limit the lives of disabled children, young people and their families (Thomas, 2007). We are interested, then, in how a posthuman orientation can help us to think differently about the material (e.g., body and environment) and immaterial (e.g., emotions and virtual environments) relations in the lives of (m)others of disabled children. Above all we are interested in how posthuman thinking can be used to effect (political) change.

Our interest in posthuman disability studies has been driven by our collaborative work on the research project: *Life, Death, Disability and the Human: Living Life to the Fullest* (hereby *Living Life to the Fullest*) carried out in England from 2017 to 2020. Through engagement with narratives and the arts, *Living Life to the Fullest* sought to forge new understandings of the lives, hopes, desires and contributions of children and young people with life-limiting and life-threatening impairments (LL/LTIs) and their families. Too often, knowledge production about the lives of children and families living with LL/LTIs is dominated by medicalized, individualized and pathologized accounts, reflecting the concerns of professionals, rather than the views of children, young people and families themselves (Curran and Runswick-Cole, 2014). Our work seeks to respond to these dominant accounts, by co-creating narratives with disabled young people and with family members themselves (Ryan and Runswick-Cole, 2008; Runswick-Cole and Ryan, 2019; Whitney et al., 2019).

In brief, our aim, in this chapter, is to offer new understandings of the stories of (m)others of disabled children through a posthuman thematic narrative analysis. In our analysis, we explore (m)others’ entanglements with human and non-human animals, machines and environments. In doing so, we hope that an expansion of the posthuman disability studies project (Goodley et al., 2014) and method can inspire (political) change.

(M)others of disabled children

We use the term (m)others here, not to reinforce the gendered nature of caring roles in the global North, but to pay attention to the fact that the vast majority of parental labor is still carried out by mothers. The bracketing of the “m” is used to acknowledge that these roles are taken by others too: men, women and those who refuse such binary identities (Douglas et al., 2021). We follow Gabel (2018: 554) in understanding (m)othering as “... situated within the institution of motherhood and numerous other structures or institutions (for example, class, race, marriage, patriarchy) and ‘mother’ as a subject position, a locus point in power networks.”

Research focusing on the lives of (m)others of disabled children has typically been shaped by humanist assumptions leading to a research focus on the “burden” of parenting a child who fails to conform to the ideal of the bounded, rational, autonomous and sovereign human subject. (M)others are, then, typically, cast as being in a state of “grief” about the birth of their disabled children and in need of a process of adjustment mediated by psy-professionals (Bruce and Schulz, 2002). These dominant narratives have prevented a move beyond a position of negativity and have obscured other, more positive, dimensions of (m)othering a disabled child (Ryan and Runswick-Cole, 2008).

While there has been a shift in research toward more positive and affirmative aspects of (m)othering disabled children, tensions remain. Indeed, traditionally, both disability studies and feminist theory have been reluctant to engage with matricentrism (Douglas et al., 2021). Feminists fear that any discussion of mothering will inevitably lapse back into essentialism inadvertently reinforcing the position of women as primary carers (O’Reilly, 2016). Disability studies, on the other hand, has a tradition of being preoccupied with separating the personal from the political domain (Oliver, 1990) and, in doing so, has pushed (m)othering to the margins (Ryan and Runswick-Cole, 2008; Runswick-Cole and Ryan, 2019; Douglas et al., 2021).

A posthuman approach can help to move beyond these tendencies to fix (m)othering in the realm of the individual and psychological. By paying attention to the self, becoming through complex relationships with multiple others (Feely, 2019: 167), the sharp focus on the mother-child dyad as the site of observation, surveillance and remediation can be softened and blurred to enable us to think more expansively and relationally about children and (m)others. Posthuman (m)othering draws attention to the distributed nature of care (Booth and Booth, 1998) and complexity of im/material flows at play in shaping (m)othering practices. Families of disabled children have resisted the individualizing and pathologizing tendencies of the humanist tradition; they have demonstrated the importance of collective support in enhancing the lives of children rather than dwelling on individualized autonomy (Ryan and Runswick-Cole, 2008; Runswick-Cole and Ryan, 2019). In posthuman times, (m)othering disabled children emerges as an exemplar of a posthuman relational ethic that demands that we think again about how we are all made through our connections with others (Goodley et al., 2014). A posthuman orientation removes “the obstacle of self-centered individualism to embrace an *ethics of becoming*” and “an enlarged sense of inter-connection between self and others” (Braidotti, 2013: 49).

The project: living life to the fullest

Living Life to the Fullest: life, death, disability and the human is an interdisciplinary arts-informed UK Economic and Social Research Council funded research project that was carried out in England between 2017 and 2020. Relationships with disabled young people have been at the heart of the research project and processes. Early in the research project, virtual spaces emerged as accessible spaces through which young people could both engage with, and, crucially, shape and lead the research process. We established a Co-Researcher Collective which included disabled young people aged between 19 and 30 years. Working online (and occasionally off-line), the Collective have:

- Supported research design through discussion (planning both narrative and arts-informed approaches);
- Co-designed interview schedules for young people and parent participants;
- Recruited participants;
- Planned the project’s impact strategy by building relationships with partner organizations;
- Worked with community research partner organizations;
- Met regularly via the Research Management Team to co-manage the research process;
- Written blogs and made podcasts and films that communicate and document processes and findings;
- Presented at academic conferences;
- Undertaken various public engagement and knowledge exchange activities;
- Co-authored articles for publication and a book about the project (Whitney et al., 2019; Liddiard et al., forthcoming).

This relational approach to research is central to a posthuman ethic. And yet, although young people were involved in the design of the interview schedule for parents, they were not involved in the interviews themselves. Aware of the potentially sensitive nature of the interviews, we checked with parents in advance to see if they would be happy to be interviewed by disabled young people—all of the parents declined and asked to be interviewed by a member of the University staff team. Therefore, Kirsty and Katherine carried out all the interviews/focus groups with parents. Parents expressed worries about discussing their lives with young people, they worried that they would not be able to talk freely or that they would be burdening young people with their responses. This was a difficult moment for the project team that had begun with a commitment to young people as research leaders and collaborators. And yet, it became clear that an ethic of care meant that we had respect for the parents’ decision to be interviewed by university staff

members. In line with this ethical concern, we also agreed with the disabled young people researchers that we would not share the parents' full transcripts with them. As a result, this paper has been co-authored only by the university staff team. We acknowledge the tensions in this decision-making process and the messiness of working ethically in relational ways with young people and (m) others.

Developing a posthuman narrative analysis

We follow a tradition in critical disability studies in turning to narrative analysis to think about the lives of (m)others of disabled children (Smith and Sparkes, 2008). Stories construct our lives and ways of being; they are part of being (post) human. Crucially, stories can be more than windows on the worlds of others, they can be a call to social action (Smith and Sparkes, 2008). Parents all identified themselves as the parents of children and young people who had life-limiting or life-threatening impairments. The stories re-told here were collected by Kirsty through on-line interviews with two mothers and one father. Technology allowed for increased accessibility for (m)others with busy lives and access to technology. We note that access to technology was a barrier to some (m) others' participation and we carried out a person-to-person focus group with (m)others to try to mitigate against this.

The story-tellers in this paper are:

- Eric is father to 24 year-old Alison, who lives at home with the family. He works 60 h a week as a carer for Alison, who works full time;
- Ruby is mother to Matthew who died 1 year before the interviews took place, aged ten. She works part-time.
- Karen is a single mother to Jason, aged twenty-four, who lives at home with her. Karen works full time.

Narrative interviews were carried out on on-line platforms at a time of the participants' choosing and lasted no longer than an hour and half. Participants were offered regular breaks, though none asked to pause the interviews. Interview questions were open, beginning with "can you tell me a little bit about your son/daughter?" Rather than follow a strict individual schedule, each interview took a different path, followed-up with prompts and probes asking questions about chronology: "when did that happen?"; affect "how did you feel about that?" and offering affirmation: "okay"; "I see." Throughout the interviews the interviewer sought to engage in active listening: to be attentive, responsive and curious (Smith and Sparkes, 2008). The questions encouraged the (m)others to weave their disparate experiences together to build a story (Monforte et al., 2019). At the center of the approach was an aspiration to behave sensitively, accommodating the participants' needs and engaging in an ethic of care. As a team we also took seriously the responsibility of care we had to one another and we were able to discuss the stories we collected throughout the research process. Our intimate connections to disability and (m)othering meant that the stories touched us all in different ways, at different times, in the project and we needed to attend to this carefully throughout.

In line with traditional approaches to thematic and narrative analysis (Braun and Clarke, 2006; Clandinin and Connelly, 2020), we began by reading and re-reading the transcripts. However, we did not follow a stringent step-by-step approach to coding and thematizing the data, rather we drew on our posthuman sensitivity to read for the human and more than human entanglements within the story. As we read and re-read the transcripts, we paid particular attention to the moments when the story tellers told us about how their lives were caught up with:

- (1) **Human and non-human animals:** other human beings, including their children, family members and practitioners and with animals;
- (2) **Machines:** this included mundane technology, such as smartphones and iPads, as well as specialist equipment, like power chairs and hoists, and medical technology, such as ventilators and feeding tubes.
- (3) **Environments:** understood here, as encounters with im/material objects and systems which presented barriers or offered opportunities in their lives;

Reading the stories in this way allowed us to develop a posthuman thematic narrative analysis in which themes are generated by paying attention to entanglements with human and non-human animals, machines and environments in the stories.

At this point, we want to pay attention to our choice not to engage in assemblage analysis (Feely, 2019) which may at first seem to fit well with our commitment to posthuman theory. In Feely's (2019) article, he offers a comprehensive guide to assemblage analysis in which he tracks material-semiotic forces, and flows within an assemblage. He describes an assemblage by saying:

An assemblage should not be understood as a fixed entity because it is always in a process of becoming. Its diverse components come together over time; work together for a time to produce something; and, in time, will fall apart. For example, the disability service assemblage's components (e.g., buildings, bodies, policies) came together over time, are currently working together to produce the service, and will eventually fall apart.

Feely (2019: 6).

In the final stage of the analysis, Feely (2019) examines the processes of reterritorialization and deterritorialization within the assemblage which allows him to pay attention to the dual process of stabilization and destabilization in the assemblage as the elements in the assemblage act upon one another.

This assemblage approach understands social problems as produced by human and nonhuman actors, and discursive and material forces and is underpinned by a flattened ontology where all entities in the assemblage are all assumed to be in process rather than fixed. They are ceaselessly becoming at different rates of speed and slowness and are all worthy of equal attention (Feely, 2019). And here, despite our posthuman leaning, is where we depart from assemblage analysis. We are interested in the material-semiotic forces flowing in the stories, we see the value of paying attention to the human and more than human elements in the story, and yet, in our readings we find ourselves inevitably drawn to the human actors (Brinkman, 2019). We recognize that the draw to the human risks falling into the trap of anthropocentrism and valorizing the very humanist human that we critique above. And so, our aim is to enact a posthuman thematic narrative analysis that might enable us to do two things:

1. In Brinkman's words, "[t]o stay human without being anthropocentric" (2019: 137). That is, we can allow our attention to be drawn back to the human in the narratives and yet still resist any call to human dominance over nature;
2. Hold onto the notion that the "human being is not an ahistorical, disembodied and universal intellect, but rather a historical, embodied, affective creature that lives in a sociomaterial world of flux and uncertainty" (Brinkman, 2019: 136), allowing us to pay attention to the more-than-human in the stories.

In the sections below, we explore, in turn, the families' entanglements with human and non-human animals, machines and environments. While we present each of these themes separately, we acknowledge that human and non-human animals, machines and environments are intimately entangled with one another. In this act of separation, we resist the temptation to silo or to fix the data and recognize that the themes speak across one another in their entanglements.

Entanglements with human and nonhuman animals

The stories were written through entanglements with human and non-human animals, that is, in each story (m)others told their stories through their relationships with other humans and with animals.

Not surprisingly, the (m)others all spoke, at length, about the deep connection they had with their children. All the (m)others were or had been carers for their children; this included carrying out care not usually associated with parenting, including complex personal and medical care. While care is often storied as a drain or a burden (a challenge or a barrier), the (m)others spoke about care as bringing them closer to their children (as potential). Eric noted that he spent more hours a week caring than engaging in his paid work, and for him, care was a joy:

... in exchange for the 60 hours of so week's work that I put in, it's you know, it's been amazing, I think, for me—a benefit and a joy to be able to be a close part of [my daughter's] life

Ruby, too, talked about the care she gave her son, and the connection between them. The depth of the connection between them was brought into sharp focus following Matthew's death:

I gave up everything and put everything into Matthew. I lost so much of myself and afterwards, not so much now because I think I have kind of untangled myself a little bit from it, but at the start I felt like—it is really difficult to explain—but I just felt like I was tangled in Matthew. I just, I couldn't, I didn't know—people said to me "what do you want to do now?"—"I don't know"—and I didn't know anything about myself, I couldn't have told you what my favourite food was, what my favourite colour was

In explaining that Ruby was "tangled in Matthew," she echoes the language of entanglement that frames our posthuman narrative analysis. Reflecting back on her relationship with Matthew, Ruby beautifully articulates the closeness of the relationship between mother and son, and the pain of his death.

The (m)others also spoke of how their disabled children had brought them into close relationships with other people. Eric described how Alison had brought new and unexpected relationships and understanding into his life:

I guess really the world of people with disabilities which I would never have had an appreciation of without has been, you know, something that for me has been a really important thing for me to understand.

Karen also recognized the connections made between her and other families of disabled children through impairment specific conferences and support groups saying that:

I wouldn't say I have lost any friends from it at all, I have gained a whole new tribe of global people all across the world.

Ruby described the close relationship that she and Matthew had formed with a nurse who had looked after Matthew since he was a baby.

I think a plus for us was that the nurse that was looking after us [in the specialist unit on the night he died] had known Matthew since he was about 6 months old and first transferred to the children's ward at [the local hospital]. She had looked after Matthew on her last day at the [local hospital] before she had moved to [the specialist unit] and we were friends on Facebook. [The night he died] she had come and looked after Matthew. She had waited [with him] until they had put him in the, in the freezer bit, and she said she hadn't left his side until she literally had to. She said like she had brushed his hair to the side and gave him a little kiss and stuff like that so, it was just those little things I think that makes such a massive difference.

As Ruby describes the relationship with the nurse, we see the importance of the relationships between them and the ways in which their lives were entangled from when Matthew was 6 months to 10 years when Matthew died. In the story, it is impossible not to be drawn to the (unnamed) nurse's very human act of brushing Matthew's hair and giving him a kiss, at the same time as we see the entangled relationship between Matthew, his mother and the nurse, as an exemplar of posthuman relational ethic revealing how we are all made through our connections with others (Goodley et al., 2014).

Elsewhere we have written about the positive relationships between young people and animals, reflected in their accounts of the roles that assistance dogs play in their lives, but also in their day-to-day relationships with animals as companions (Whitney et al., 2020). The (m)others too spoke about their children's relationships with animals during recreational activities such as horse riding. However, they also spoke about animal testing as a means of developing new drugs to treat life threatening and limiting impairments. Such drug trials offered them "hope." And yet a posthuman ethic demands us to question a utilitarian approach in which animals' lives are viewed as collateral damage in the name of (human) progress (Braidotti, 2013). The story brings us up short and offers us a stark reminder of the risks of romanticizing the relationship between human and non-human animals in the lives of disabled children and young people.

Entanglements with machines

(M)others' accounts were also peppered with descriptions of their children and their relationships with machines. Karen remembered how "Jason went off his feet at thirteen, first into a manual wheelchair, eighteen into a powered chair." Eric described key moments in Alison's life in relation to technology—Alison got her first electric wheelchair at four and became "ventilator dependent" some 12 years later. Matthew came home from hospital as a baby with: "24 h oxygen, feeding tube, loads of meds, we had a blood pressure monitor, a SATS monitor." This scene draws us to thoughts of cyborgs. Haraway (1990: 191) tells us that:

A cyborg is a cybernetic organism, a hybrid machine and organism, a creature of social reality as well as a creature of fiction.

Hybrids and cyborgs allow us to think about human potential in a postmodern world, saturated with technology (Goodley, 2014). Cyborg potential lies in its uncertainty and multiplicity; crucially "[t]he cyborg is a kind of disassembled and reassembled, postmodern and collective self" (Haraway, 1990: 205). Crucially for us here, the cyborg makes us think about interconnections between machines, but also with and between human beings as it opens up the possibility to think more expansively about bodies and relationships (Goodley and Runswick-Cole, 2011).

Alongside this focus on specialist equipment in the mothers' accounts, the plethora of day-to-day gadgets and devices that so many young people plug into, including smartphones, tablets and gaming machines, were also central to the lives of disabled young people. Eric describes Alison: "when she is not in her wheelchair she will just be sitting comfortably on the sofa with her gadgets and devices." We hear that Jason is "big on gaming and would always take the PlayStation to college and then bring it back," but he is also on a clinical trial which means that "every 3 months we go into [city] and they plug in our little home device to Switzerland and take that data." Specialist equipment and medical technology blends with gadgets, play stations and smartphones and becomes undifferentiated in families' lives.

Low tech also plays its part in family life. We learn that Matthew's arms were gaffer taped onto a pod on skis to protect them so he could experience the speed of flying down the slopes which he "absolutely loved." Low tech solutions were important for inclusion. Ruby described how Matthew's support staff would "always find a way around things—they would cling film his arm up, wrap it up in a plastic bag, sit him in a paddling pool next to the swimming pool where all his friends were swimming so he was still *included* experiencing similar to them, he loved water as well."

(M)others too were plugged into machines using social media as a crucial source of information and support. Karen described the connections social media had allowed her to make:

I was talking to a mother in Australia at stupid o'clock this morning and her son is really in end stage and she is out in the complete hoolies and of course it is 35 degrees there now and it is his birthday and everything and she was planning all sorts of things and you think "who else has she got to talk to?"—she is talking to me.

Ruby remembered the time before social media and the positive change it had brought to her life connecting her to other (m)others:

I think so yeah, I definitely felt more isolated in the early years erm again there was sort of no social media then so I didn't really know anyone in a similar situation and it was just kind of me ... but then social media came in and I think played a massive part in connecting parents that had children of a similar nature and you would kind of get support from each other.

The families' entanglements with machines range from the mundane to the life-saving, from entertainment and recreation to treatment and care. The cyborg, therefore, offers us possibilities for reconceiving notions of desire by and between human subjects (Shildrick, 2009), but as we explore these possibilities, the stories also remind us to resist the temptation only to celebrate cyborgification in the lives of disabled young people and their families.

Machines fail. Technological failings have massive impacts on children and young people's and families' lives. Ruby told us of just one example: "a tube had got caught in the lining of [Matthew's] stomach so they had to open him up fully, take part of his stomach away." And when Matthew died, it was important to Ruby that Matthew was disentangled from the machines that had, only a few moments ago, been keeping him alive:

the night he died ... they turned all the monitors off so that nothing was sort of alarming left right and centre ... they had taken out all the lines they could ... they had washed him and put him in some PJs and things like that they'd moved him over slightly in the bed so I could get in the bed with him.

Cyborg desires (Goodley, 2014) are shifting, uncertain, and sometimes, fade away.

Above all, these everyday (and not so everyday) entanglements with machines remind us that all children and young people and their families are becoming (more than human) humans (Brinkman, 2019).

Entanglements with environments

Here, we think of environments as encounters with im/material objects and systems which presented barriers or offered opportunities in children and young people's lives. Sadly, material barriers persist:

We are always finding the challenges of places not being accessible. Nobody is there to get us off the train, the lift is broken, you know that sort of thing (Eric).

Decades on the challenge remains, disabled people are still having to advocate for the removal of (material) barriers to their participation (Oliver, 1990).

At the same time, there were examples of possibility. Karen told us about when Jason arrived at his new school which he experienced as a barrier-free environment:

Well, I remember Jason's exact words was—"well everybody has got a problem [at this school] so [disability] is not a problem."

While material environments continued to present barriers in the families' lives so too did disabling systems (Runswick-Cole, 2010). Ruby describes the financial shock inflicted on the family by the social security system:

... then literally the day Matthew died everything stopped—housing benefit, council tax benefit, carers allowance, tax credits, everything—so we basically went from having, from being sort of on that lower end of comfortable to literally begging, borrowing and stealing just to pay our bills.

Finally, (m)others were acutely aware of their role in providing enabling environments for their children and their fear of what would happen if they could no longer take that role:

I guess the biggest worry will be—will there be somebody there who will provide the safety net, who cares and will do the things that Alison needs to the standard (that you do) that we have always done them (Eric).

Conclusion

In this chapter, we set out to explore (m)others' narratives through drawing on a posthuman approach to develop a thematic narrative analysis to explore relationships between human and nonhuman animals, machines and environments. We began with a political commitment to (m)others, children and young people and the need to challenge the material and immaterial conditions of disablism. Our inquiry is driven by the question of how posthuman thinking can be used to affect (political) change in their lives. As we end the chapter, we return to that question.

A posthuman reading of the (m)others' stories demands us to pay attention to a relational ethic that enables us to think again about how we are all made through our connections with others. By paying attention to the (m)others' entanglements with their children and with other human and non-human animals, machines and environments, the stories reveal processes of selves being made in relationships (Feely, 2019). This is crucial, because this recognition of the inescapability of relationality has (political) consequences for how we understand (m)othering. (M)othering is not made in the actions of isolated individuals but in the relationships between people. Recognizing this relationality has huge implications for the ways in which we might understand parenting, child development and support, as a collective action, rather than an individual, mother-blame, or mother-shame, game (Gabel, 2018; Ryan, 2017; Runswick-Cole and Ryan, 2019).

The (m)others' narratives have also forced us to revisit the project's engagement with young people's relationships with animals (Whitney et al., 2019). We continue to recognize the importance of those relationships in families' lives and the mutual support, care and companionship these relationships signify. And yet, we need also to keep in mind a posthuman ethic which demands us to confront the uncomfortable political reality that means that animals' lives can still be viewed as acceptable collateral damage in the name of (human) progress (Braidotti, 2013).

Entanglements with machines in families' lives reveal the mundanity of the cyborgification of family life as low tech and high tech sit side by side enabling entertainment, recreation, treatment and (life-saving) care. And, crucially, the cyborg emerges as an object of desire and disavowal. A recognition of the complexities of the relationships with machines, and the material and affective flows they generate, is crucial to understanding family life. The stories reveal the persistence of disabling environments in families' lives and a persistent failure of political will to address inequality. This harsh reality meant that (m)others imagine future environments without them in it as frightening spaces for their children.

Finally, in order to bring about (political) change, we end with a call for a relational activism inspired by a posthuman ethic to expose and to challenge disablism. (M)others accounts of online activism offer increasing potential for advocacy and activism (Runswick-Cole and Ryan, 2019) and yet the pace of change is too slow, and the shift to the digital continues to marginalize many. The (m)others' stories trace the intricacies of relationships between human and more than humans and demand a (political) response which recognizes and celebrates interdependencies and disability activism inspired by a renewed commitment to collective action (Runswick-Cole and Goodley, 2017).

... the struggle of our new millennium will be one between the ongoing imperative of securing the well-being of our present ethnoclass (i.e., Western bourgeois) conception of the human, Man, which overrepresents itself as if it were the human itself, and that of securing the well-being, and therefore the full cognitive and behavioral autonomy of the human species itself/ourselves.

Wynter (2003, p. 260).

Introduction

The 20th century “West” has been marked by an intensification of abilities that the 21st century is now automating, throwing into question the entire project of compulsory schooling and tertiary education as cauldrons of ability-production. The challenges posed via machine learning, affective programming, brain-machine interfaces, and the development of whole-body robotics, to name a few, potentially undermine the regulatory, selectivity, distributive, and expert functions of such institutions. New technologies developed largely outside of education are rewriting the definition and need for skills within it, such as memorization, data analysis, and even “learning” (Baker and Wang, 2020; Cooper Ramo, 2016). On the one hand, this longer-term existential challenge to state-sponsored formal education may be seen as good riddance, as an overdue reckoning of the harm that such institutions have delivered to populations who have been minoritized, marginalized and made the most vulnerable via disciplinary societies. On the other hand, no legitimate substitute for education’s babysitting function and false meritocracy has yet emerged, in part because the functional differentiation of the labor force is still in operation as the tail wagging the curricula dog.

More than simply institutional reorganization, however, Sylvia Wynter has posited that the overrepresentation of the human by a particular Christocentric and then biologic “figure of Man,” indebted in its shift to colonialism and racialization, has put the continued “autonomy of the human species” at stake. Wynter’s analysis captures the tensions and dynamics on a broader scale of human existence as opposed to specific reforms debated in education that assume the perpetuity of a human species in its current form. Her historical account, while not dedicated solely to ableization discourse, brings to a point the current intensity of its entwinement with themes of existence, nature, state-crafting, racialization, and violence that have interlaced educational discourse. This chapter thus takes as its springboard, guide, and point of departure Wynter’s historical analysis of the shifting figure of Man and its implications for the (re)formation of ableist subjectivities.

For Wynter, Man1 (Christocentric, Latin-based) emerged under medieval Christianity’s horizon-setting around the supernatural, followed by Man2 (biologic, secular, degodded) who arose in part via Renaissance humanism’s pursuit of scientific materialism that endures through to the present. The analysis is supplemented here with the appearance of man3: (small “m”) the attendance today to “computational superintelligence” via the advent of technologies associated with contemporary intersecting innovations such as artificial intelligence (AI), neuroscience, and big data. As such, the chapter examines how the historical figure of Man has been reconstituted via discourses that shift from capacity to ability, and more recently, automation, especially of apparently “cognitive” functions.

The sections below outline some historical trajectories that contributed to the availability of shifting ableist subjectivities.¹ In an almost prophetic analysis, Campbell (2000) argued that ableist subjectivities are formed and reformed at the heart of eugenic legacies which endured post-WWII, new forms of late 20th century technologies including genetic ones, and the law. Together, these reinforce “disability” as negative ontology and non-voluptuous, recirculating a desire “to-be-able” to do, within normative conceptions of appearance, skill, talent, and mental life. Participating in activities that today would position one as performative, contributory, and beautiful became under this formula the new inscription of the competent citizen and/or cosmopolitan globalist

¹The problem of re-entry when operating within what Deleuze calls the classical image of thought is obvious—any “rethinking” is amenable to the same charges of ableism and adultism that underwrite developmentalist versions of ableist subjectivity. For an extended discussion of this see Baker (2013). For an extended discussion of systems theory in sociology see Luhmann (1995) and Eva Knodt’s introduction in that volume.

(Campbell, 2013). Ableist subjectivity is not an eternal and ahistorical category, then, but a production of so-called modernity, an incredibly powerful one that arguably organizes and/or merges with other forms of -ism in rationales for the biopolitics of privilege, exclusion, disqualification, and life/death (Baynton, 2001; Foucault, 1979). This chapter will illustrate some of the conditions of possibility for its formation in a “Western” philosophical canon not by focusing on “disability” per se, but on discourses that promoted the normalization of human development and humanhood (Weheliye, 2014), pointing to implications of recent technological shifts for conceptions of “the human” marking educational discourse.²

The examples are drawn from what can retrospectively be labeled whitestream scholarship published in places now referred to geopolitically as England, Germany, and the United States from across the 1600s, 1800s and 2000s, forming part of an apparent canon of Western onto-epistemologies. Such scholarship helped lay the groundwork for mainstream educational theories that subsequently had to be challenged and fought against from more critical and post foundationalist perspectives. From Lockean empiricism to Gallian materialism to Tegmarkian Life 3.0 based on artificial intelligence (AI), the figure of Man has been reconstituted based on different premises about what he is, and what he is made of, each time. Such shifts change the nature and the stakes for educational fields ensconced historically in humanism, forcing reconsideration of things such as genius, disability, and eventually superintelligence in ways that today point to predictable forecasts of more-of-the-same injustices versus a more radical onto-epistemological revisioning.

Man1: capacities to unfold into the gentleman of the social contract

Wynter identifies two epochal shifts that launched a figure of Man as an overrepresentation for “the human.” The first was the idealized world that spawned Man1 up to the 18th century, which was subordinated to that of “the post-Gregorian Reform Church of Latin-Christian Europe” and entailed a “world of laymen and laywomen, including the institution of the political state, as well as those of commerce and of economic production” (p. 262). Man1’s “stuff” could not escape the horizon of what today would be called the supernatural, in this case in belief in an omniscient God, a character beneath which Man’s composition fell, and to whom his inborn soul belonged. Man’s character at birth was marked by the doctrine of Original Sin, setting the stage within Catholicism for the normalization processes of rearing to be focused on dealing with its “stain.”

For Wynter, Man2 emerges from the 18th century until today, through several trajectories including “the secularizing intellectual revolution of Renaissance humanism, followed by the decentralizing religious heresy of the Protestant Reformation and the rise of the modern state” (p. 262). If Church domination in particular was to be challenged or undercut, the Renaissance needed to produce a new figure of Man, one not supernaturally inspired but rather attributed to nature.

What bridges if not inspires this shift for Wynter is not just the Renaissance, Protestant Reformation and Scientific Revolution, however, but also colonialism and the invention of the idea of race. Quoting Quijano, Wynter notes that the idea of race would come to be “the most efficient instrument of social domination invented in the last 500 years” spawning new ontologies, ontological hierarchies, and subjugations, articulated as “natural,” and where: “One of the major empirical effects of which would be ‘the rise of Europe’ and its construction of the ‘world civilization’ on the one hand, and, on the other, African enslavement, Latin American conquest, and Asian subjugation” (Wynter, 2003, p. 263).

Here, what makes Man2 particularly distinctive is the conceptualizability “of nature as an autonomously functioning force in its own right governed by its own laws” appended to rationales for racialization and colonialism (Wynter, 2003, p. 264). Wynter argues that this, in turn, made possible academic disciplines, “the cognitively emancipatory rise and gradual development of the physical sciences (in the wake of the invention of Man1), and then of the biological sciences (in the wake of the 19th century invention of Man2)” (Wynter, 2003, p. 264). The disciplines gave a different “matter,” a different rationale and kind of “stuff,” a biological stuff called “nature,” as the reference point for the exclusivity of “the human” and this belief in exclusivity, reinforced by the processes of colonization and racialization with which it was concomitant, has put the planet at risk:

... the fact remains that while the natural sciences can explain and predict, to a large extent, the behaviors of these nonhuman worlds, the disciplines of the social sciences and humanities still remain unable to explain and predict the parameters of the ensemble of collective behaviors that are instituting of our contemporary world ... These behaviors, whether oriented by the residual metaphysics of fertility/reproduction of the agrarian age in the poorer parts of the world, or by the metaphysics of productivity and profitability of our techno-industrial one in the rich enclaves—with the one impelling the dynamics of overpopulation, and the other that of overconsumption—now collectively threaten the planetary environment of our human-species habitat.

Wynter (2003, p. 270).

The big picture formation of a “globe” pockmarked by nation-states, the division into so-called First World and Third World economies, and the threat to environment met the instantiation of education as compulsory in a way that supported exclusionary forms of nationalism. One fundamental pivot in this big picture narrative that Wynter paints, then, is the emergence of new conceptions of nature that not only bridged between Man1 and Man2 but inspired a new set of institutions and notion of the state. In

²Technology here is being used within an everyday notion of the digital, algorithmic, and electronic. For an historical account of the emergence of cybernetics in particular within educational theory in the US see Ivens (2018).

educational discourse, this was supplemented by an empiricist epistemology that established “ableist” ontologies and sensationist pedagogies dedicated to the unfolding of reason-as-morality in “sound” beings. The work of John Locke (1632–1704) is one site that illuminates this pivot and bridge around nature, empiricism, and Man2’s emergence and introduces a kind of ableist subjectivity dedicated to “morality” and “civility” as key distinguishers.

Locke on nature

A sound mind in a sound body, is a short but full description of a happy state in this world. He that has these two, has little more to wish for; and he that wants either of them, will be little the better for anything else.

John Locke, *Some Thoughts Concerning Education*.

The idea that there is only one universal inscription of who or what counts as a child was debunked decades ago and the fact that it had to be is a sign of a figure of Man’s domination. Attention to how “the child” is used, described and deployed, emptied and filled with different possibilities and limits in culturally mediated settings, is one way to understand the impact of a modernity-colonialism vortex to which Wynter refers and the reliance on discourses of nature. The works of John Locke, often positioned as one of the “fathers” of psychology and empiricism, are a good index of how normalization was encouraged through embedding a specific set of possibilities and limits in “the child,” exclusively rendered.

The normalized child of Lockean texts was given parameters, qualities, and roles across Locke’s political philosophies, such as *Two Treatises of Governments* (1689), his epistemological mainstay, *An Essay on the Human Understanding* (finished in 1689 and published across four editions), as well as more overtly pedagogical texts such as *Some Thoughts Concerning Education* (1692). The child is normalized across such texts as being a boy born with a mind, body, and soul, the former of which is posited as a blank slate and as having a series of capacities thought to unfold into faculties suited to a new social contract. This is a contract in which, as a member of the elite classes, the boy is intended to participate as an English gentleman.

Several discursive trajectories enabled the intertextual Lockean child—English, rich, male, and pale—of the late-1600s to appear peculiar relative to its premodern predecessors. These trajectories included in part the uptake of mechanical reasonings in political philosophies, a Renaissance culture of “human” dissection that made interiority into a different fabric, and the emergence of an English Protestant conception of the nuclear family (Baker, 2001). These ruptures gave new meaning to terms such as *power*, *nature*, *reason*, and an *interior/exterior problematic* in thoughts about humanity in a monotheistic-inspired politico-religious universe.³ This version of the normalized Lockean child emerged, then, out of some of the prior strictures associated with Man1 in Wynter’s terms and mark an opening toward Man2, more fully effected centuries later.

For example, in his social circle at Oxford, Locke was involved in discussions over transubstantiation. Before being able to answer religio-moral questions, Locke pondered instead what Man was in a condition to know and in particular what the capacity of human mind for understanding and knowledge might be altogether. This shifted analysis toward formulating answers around the capacity of a human mind to know (where mind was considered a nebulous thing somewhere within the body), and away from finding an answer suited to absolute Truth believed to be held by a spirit-Creator, changing the relationship between God and Man that Wynter discusses. It also changes *the route* through which scholars proceed to find answers to difficult questions.

In Locke, that route was peppered with references to nature. There are at least four inscriptions of nature across Locke’s texts that indicate his reconceptualization of human life as exclusive and hierarchized, and that help to establish a sensationist pedagogy amid the importance of reason-as-morality. Nature was: (1) the source of ideas, that is, it is the mechanical laws of motion we might guess lie behind the getting of an idea, e.g., the *Essay*, (2) a moral and positive concept, the Laws of Nature, equivalent to God’s Laws, e.g., *Elements of Natural Law*, (3) a sometimes negative, sometimes reasonable, and therefore ambiguous state, that is, the state of nature was a historical category referring to an imagined time and condition under which Man had once lived, e.g., *Two Treatises*, and (4) a form of both predetermination and openness that exists in a child for unfolding its faculties over time, e.g., *Some Thoughts Concerning Education*. While these different renditions of nature appear in various works, they cannot be disassociated in the end from the instabilities and flexibility that was written into the normalized child, its powers, and the pedagogy deemed appropriate for it in *Some Thoughts*. It is beyond the remit of this chapter to elaborate each of these examples of the complex deployment of nature in his texts. The very range, however, underscores both the difficulty and the significance of rewriting a figure of Man from supernature to nature.

For instance, Locke’s most famous epistemological principle, that all our ideas come from experience, either from sense perception or from reflection on our own mental activity, was not underpinned by a view of ideas as fantastical or phantasmatic but of ideas as *natural*. What is important about the inscription of ideas as natural is that this assertion was arrived at through the *religio-moral* debate referenced above, a theological altercation that incited Locke’s explicit search for the limits of human knowledge, the substance of which is now referred to as “psychology.” The degree of certainty with regard to religio-moral knowledge that a human could have, what could constitute “knowledge,” was an express concern in the *Essay*: “Our business is not to know all things, but those which concern our conduct” (quoted in Baker, 2001, p. 146).

³For a more extended discussion of these trajectories and how they inflected different concepts such as power see chapter two in Baker (2001).

In delineating the mechanics of this knowing, Locke paints a picture of mind as having, like body, its own mechanical laws of operation which is what natural here means. When working “properly,” the normalized adult mind has powers internal to it and lets external objects work on it in Newtonian fashion:

In time the mind comes to reflect on its own operations about the ideas got by sensation, and thereby stores itself with a new set of ideas, which I call “ideas of reflection.” These are the impressions that are made on our senses by outward objects that are extrinsic to the mind; and its own operations, proceeding from powers intrinsic and proper to itself, which, when reflected on by itself, become also objects of its contemplation ... Thus, *the first capacity of human intellect is that the mind is fitted to receive the impressions made on it*; either through the senses by outward objects, or by its own operations when it reflects on them.

Locke and Emmens (1866, p. 62; emphasis added).

The inscriptions of nature in *Two Treatises on Civil Government* further modify or make indeterminate any overall meaning of the term nature in Locke’s work, however. Locke’s reference to the “Laws of Nature” operates sometimes as another positive use of the term and sometimes in contrast, yet not diametric opposition, to the law of reason. Laws of Nature can refer to a moral inscription of an orderly society where the Laws of Nature would deem that to harm someone else’s life, liberty, health, or property was not appropriate. Locke thereby elevates individual possession and protection of these things to the special status of the Laws of Nature.

This multiplicity of meanings of nature in Locke’s work constitutes one of the grounds on which the child comes into view as modern and romantic: the child lies in positive relation to nature as mechanical and regular forces, it is vulnerable to immoral forces that lie outside of its body at birth but that lie within the realm of human conduct, and it has a discretely identifiable interiority that works in ordered ways to construct the knowledge necessary for reasonable decisions. The intersection of Lockean renditions of nature also therefore produces the subjectivity available to the child of his texts. Departing from a more troubled, “precivil,” state of nature’s past into a more “advanced” future of self-governing, reasoning adulthood becomes the possibilities inherent to being the child and the parabola of development itself (Baker, 2001, pp. 156–57).

These assumptions about nature, reason, and the parabola of development of the boy with a sound mind in a sound body thus undergird and underscore the formation of an ableist subjectivity in educational discourse that is indebted to specifically Protestant, mechanical and empiricist notions. These notions are not freestanding. They are interlaced with a savage/civil binary that reserves privileged space for “the gentleman” in early English colonialism, striated with bourgeois notions of color, class and gender that are not always overtly named as such, and they are dependent on the assumption that only through initial bodily sensations can knowledge acquisition proceed. Here, ableist subjectivity rewrites the body/mind complex of that gentleman via an onto-epistemology that asserts that all knowledge-production requires sensory portals in “good working order.” Alongside and imbricated within Wynter’s history of colonization/racialization, then, is a new threat of “disordering” this order to knowledge-production that trusts what the body senses rather than posits sensation per Descartes as an illusion. This breaks both the Catholic Church’s hold on Original Sin and supernatural causation and can also be used to justify domination and subjugation of those cast as less-than-human abroad whose apparent “non-recognition” of an albeit provincial body/mind dualism is framed as mythological, as a misunderstanding of the facticity of such a mechanical system. Between Man1 and Man2, the child is not so much inscribed as a natural Being, but as an effect of strategies for recognizing and naming “nature” in relation to Being altogether.

Man2 and ability: distinguishing one’s self from peers

F. J. Gall (1758–1828) is best-known for his work in an area referred to by others as phrenology. In his work with Johann Gaspar Spurzheim, Gall dissected cadavers in new ways and depicted with unprecedented detail the areas now thought of as comprising the nervous system (Richardson, 2001). While phrenology has rightly been dismissed as faddish pseudo-science and as a denigrating form of determinism that posited abilities and talents as inborn in the infant, some of its most basic premises have endured, such as localization to regions in the brain, the belief in the brain as the most important organ that separates humans from animals, and the belief that matter actually matters to explaining what Gall saw as the differences between men.

The combination of assumptions in Gallian psychophysiology stood, however, in direct contrast to Lockean sensationism. Gall did not believe that the senses were the major route to knowledge or the main difference-maker in educational terms. His works marks a shift from a notion of capacity to that of ability, foregrounding more directly a thesis of physiological innatism that was to redefine ableist subjectivity relative to previous debates.

One of his major productions, titled in English as *On the Origin of the Moral and Intellectual Faculties of Man* (henceforth Volume 1) was translated as part of *On the Functions of the Brain and of Each of Its Parts: With Observations on the Possibility of Determining the Instincts, Propensities, and Talents, or the Moral and Intellectual Dispositions of Men and Animals, by the Configuration of the Brain and Head*. Together the six volumes of this collection arguably represent a “crossover” moment in which concerns for morality especially become appended to the “intellectual” (in this case quite literally via the “and” placed between the terms moral and intellectual in the title). This appending, in turn, becomes attached to debates over *matter* and the hierarchy of properties and essences. While some philosophical tracts, like Locke’s *Essay*, posit extension (length, breadth, and so on) as more significant and fundamental than weight or color, Gall’s elevation of the brain and of head-based ontology implicitly fuses appeals to shape (such as length and breadth) and to color (such as references to skin or nation) within the analytical lens, coding such observations as data—something

not entirely common within the older philosophical debates. While much canonical Western thought has posited education as inherently concerned with moral development or its analogs, the conjuncture in Gall suggests an important but subtle shift that impacts ableist subjectivity's parameters: it is *through* the intellectual that the morality objectives or purposes can be secured and viewed (Baker, 2020, p. 401).

The six-volume publication and translation put Gall at the forefront of commentary on the nature of Man and in the firing line of critics. While often mocked, his work was also thought to require a response. In Volume 1, he responds to some of this mocking. He makes appeal to terms that today have much cache, such as facts, evidence, and dissection; he offers an extended analysis of how others have misconstrued the role of the senses; and he overtly uses the term data, leading to a very specific inscription of the term matter that changes causality away from supernature and embeds it into organizational structures today called physiological (Baker, 2020, p. 401).⁴

Gall on matter

F. J. Gall's work on physiognomy is a particularly relevant site for apprehending a fuller movement into Man2 as a peculiar kind of materialism. This made education reducible to instruction and elevated a variant of predeterminist philosophy. Even though critiques of phrenology regarding mental measurement movements and eugenics have been available to education for some time, there are other aspects of phrenology's basic presumptions that have been less visited.⁵ One of those is not *whether* phrenology participated in spirit-versus-matter debates as a question of origin regarding things coded as morality, talents, and dispositions, but *how*:

Are all men endowed, to the same degree, with the qualities essential to their nature, or, are the differences observed in this respect, due to the influence of accidental causes posterior to birth? Are these differences, on the contrary, determined in the womb of the mother? And if they are innate, how are we to cultivate, to perfect them, to repress or to direct them, according to the demand of individual or general good?

Gall (1822/1835, p. 96).

Gall generates this list of questions after an overview of treatises on what he calls Man. The questions, which could still summarize debate in many fields today, operate as a prompt and frame for the argument to come and the documentation drawn upon. His position in the main is that dispositions that might manifest at a later period are inborn and not the sole product of impresses made upon the senses after birth. Dispositions that are coded as inner, innate, and inborn (Gall uses all three terms) are thought to invariably make their mark on a surface, and that surface—whether the cranium, a dissected corpse, or a behavior—is available to the observer and really the only data “we” have to analyze or justify a conclusion.

Is it allowable that philosophers, while boasting to penetrate into the essence of the soul, should treat of man by piecemeal, and confine themselves to making long treatises on the soul, as an insulated being? Exercising its functions by itself, making use of the body, at most, as a means of communication between itself and the world; when, from the moment of conception to the last sigh, every thing indicates that in this world, the soul is in dependence on the material organs?

Gall (1822/1835, p. 88).

Here, conceiving of one's self as contained was required and mind was not necessarily allied to or equated with soul. Mind was considered to go completely through the agency of an organ defined as material. Gall's position, though, was more complex than this binary, albeit informed by it. In moving away from the Lockean conception of capacities Gall redefines the role of faculties:

[W]ithout doubt, these faculties are real: but they are only abstractions and generalities; they are not applicable to the detailed study of a species, or an individual. Every man, except an idiot, enjoys all these faculties. Yet all men have not the same intellectual or moral character. We need faculties, the different distribution of which shall determine the different species of animals, and their different proportions of which explain the difference in individuals.

Gall (1822/1835, pp. 88–89).

Through the exceptionality and liminality attributed to “an idiot” in the above, the “I” of humans is posited as a priori, in *need* of a material organ or organs for expression, and while creation was potentially designed by a Creator, this realization should not prevent one from understanding the operation of organs. The brain for Gall was not a single organ but a series of organs with

⁴See Baker (2020), from which the following sections largely draw, for a more extensive analysis of the implications of ocularcentrism and temporality in Gall's theory of matter.

⁵Different critiques of eugenics and education have especially emerged across the US (Franklin, 1994; Koza, 2021; Winfield, 2007), UK (Lowe, 2000; Serle, 1971), and Australia (McGregor, 2000; Slee, 1997).

different functions. Such organs are considered to house and display (by way of shape) the different talents and propensities with which we are born and which we take as our self.

The organ of animal life, the brain of man, is an assemblage of particular organs, many of which are found in animals. The animals of inferior classes have, by the fact of their inferiority to others on the score of intelligence, fewer cerebral organs; they have only the first rudiments of the human brain, and they are, consequently, easier to decipher than those animals which are provided with a more complex brain, and a more complicate animal life, or with more numerous instincts and talents.

Gall (1822/1835, pp. 91–92).

Of special note here is the constitutive character of corporal spatiality in Volume 1, as the “idiot” and “animal,” and less frequently “the savage,” cross paths in ways that link rather than divide phenomenology and positivism:

But, have those animals who possess all the senses which we do, such as the baboon, and ourang-outang, have they more decency, and are they more moved in seeing blood flow, than other animals? Are idiots, who possess their five senses in perfection, more virtuous than the man born blind? Must not every reader perceive, that it is the interior alone which modifies the impressions on the senses, and thus leads us, by a precipitate and limited judgment, to believe their operation immediate? It is for this reason, that external objects act very differently on men and on animals; very differently on the hare and on the fox; on such or such an individual.

Gall (1822/1835, p. 132).

The architecture of an emergent medical gaze is based on a redefinition of rationality driven by acute attention to and concern for how differences arise *within*, amid the limits of normalization:

The faculty of perceiving impressions, of retaining and comparing ideas, and making application of them, is by no means in proportion to the senses either in men or animals, as is proved by the example of idiots and simpletons. Thus, could we even have it demonstrated, that man, of all animals, has the most perfect senses, we should not thus obtain the explanation of his surpassing all others in intellectual faculties.

Gall (1822/1835, p. 128).

The implicit links between Man as “race” and “dis/ability” become key distinguishers here, re-rooting the material-as-organizational. The reification of the material, as the intermediary between religion and science, is not, like social justice or new materialist discourses today, however. Referring to “the material” is not to champion the underdog, the working class, or to exoticize objects. The material becomes rather the “home” of discourses of vision and of temporality in ways that markedly challenge Church authority, on the one hand, and that positions “idiots,” “animals” and “savage nations” as knowing nothing philosophical, on the other. Gall’s deployment of the material, rather than liberating toward “equality” or operating as anti-intellectualism, is a means of carving out a third space, one that nonetheless stultifies and creates hierarchies in a different way: “in certain individuals, some organs remain always in arrear, while others acquire the greatest energy. But this explanation shows again that all the moral qualities and intellectual faculties are innate” (Gall, 1822/1835, p. 145).

The sequence seems both well-intended (salvific) and totalizing (systemic), generating a spectrum outside of which no one can step. Differentiation is then set to become a site of fascination: “savage nations,” alongside and blurred with idiots–simpletons–animals, populate one end of the spectrum, while genius and men of energy are on the other, with the vast majority presumed to reside between the two ends. The “full human, not-quite-human, and nonhuman” hierarchy that marks Weheliye’s (2014, p. 3) recognition of racializing assemblages is given a newish rationalization in such a 19th century neuroturn. Knowing Man means breaking something down into material parts, while the appeal to intelligence means knowing to do what one is “fitted for,” prefiguring the formalization of both the mental measurement movement in education and the broader social program of what came to be called eugenics.

The term eugenics was coined in 1888 by Sir Francis Galton (Gould, 1981). Eugenics roughly refers to policies and practices targeting the reproduction of “quality populations” in a given geopolitical region and emerged in education in multiple subject matter pursuits and disciplines, from physical education to literacy to music (Barkan, 1992; Duster, 1990; Koza, 2021). While it became a transcontinental movement in the throes of nation-building and not just in the “West,” historians of eugenics today disagree as to whether it is a movement that has ended, “soft” or “hard,” a discrete discourse, or a diffuse set of discourses that endure through to present *neugenics* (Baker, 2013; Crowe, 2000; Davis, 1997; Carton, 2000; Winfield, 2007).

Regardless of the debate over eugenics’ impact, longevity, and coherence, however, an ableist subjectivity dedicated to judgment on the basis of matter-as-organizational and phenotypical took hold, lacing racialization and ableization discourses together as rationales within a biopolitical and statist medical gaze. For children positioned as racialized minorities, putting to death was always-already real in community contexts of multiple clashing cultures, especially in indigenous and Black communities forced via genocide and enslavement into the statist structures of a New World nation such as the United States, forming a palpable basis for transgenerational fear for the safety of the young. The “talent” criterion, such as African American children being taught how to read where white children such as in the South could not, could constitute an even greater threat to life (Anderson, 1988) and

become even more of an incitement to murder—what Watkins (1993, 2001) calls the conditions of tyranny and duress under which Black education formed. With eugenics, the racialized and binarized landscape of white/non-white expanded to children of all races who appeared “anomalous” or “asymmetrical” but not evenly so. Instances of where this played out alongside and after the peak of Gall’s popularity is the reemergence of the term *genius* and the advent of training schools for children and youth labeled as feeble-minded. The genius, who in European and US contexts could only ever be cast as white and male, and the building of training schools to house children and youth whose appearance was judged as evidence of ambiguity—not so “able” as to compete for “regular” jobs but not so “disabled” (a new term at the turn of the 1900s) as to not to do some kind of work, embodied all the tensions, incongruities, multilayered forms of segregation, and exclusivity of privilege that came with colonization’s expansion into endogenous forms (Kaplan, 2000; Wrigley, 1996).

Man3 and automation: the non-necessity of human ability-as-skill under life 3.0?

From Man1 to Man2’s overrepresentation of “the human” the figure of Man’s supposed reason changes, as do the reasons given for this reason. From Protestant-inspired and sensationist versions of capacity and morality (Lockean empiricism), to innatist and psychophysiological conceptions of morality and intellect (Gallian materialism), to statist and biopolitical conceptions of genius, intelligence and “the body” (genocide, eugenics and genetics), a shift from faculty psychology to behaviorism, from spirit to flesh, and what Wynter characterizes as religion to capital “R” Race was effected. Wynter argues further that what changes across the subsequent 20th century forms of sociogeny is the emergence of systems theories and cybernetics. Such theories rewrite the “stuff” of Man away from some idealized notion of nature—whether inscribed as spiritist or biological—and toward something else posited as a system. Wynter (2003) focuses largely on a systems shift, dependent on conceptions of cybernetics, automation and autopoiesis. This gives space for seeing what might be called a nascent man3—deliberate small “m.” Systems work is evidenced across domains including the work of Bateson (1979) on learning, Maturana and Varela (1980) on biology, and Luhmann (1995) on sociology, where it is neither entirely supernature nor nature grounding the figure of Man’s comportment, but rather autopoietic systems accounting for their own production, reproduction, and innovation, blurring “Man’s” exclusivity.

In practice in education, however, a voluntarist, biologic and state-oriented dualist mind/body foundation endured as an ontological given across the 20th century, and Man’s special form of and access to a nebulous quality called consciousness became the assumption guiding the perpetual (re)organization of formal education. In the 21st century, however, a mind/body dualism and Man’s claim to a unique hold on consciousness is placed more overtly under question, and is perhaps no longer the driving force of philosophies of existence, or at least is amenable to being seen as simply a point of departure for what Tegmark (2017) characterizes as Life 3.0. Life 3.0 emerges in regard to the coming-into-being of certain forms of AI and especially as AI intersects with neuroscience and big data.

AI has operated historically as a sliding signifier. The typical disciplinary starting points for a field labeled AI are taken most immediately back to the pre- and post-WWII work of Alan Turing in the UK and his “universal Turing machine” and the Macy’s conferences in 1950s US. After the Macy conferences, designing a machine that could do what “a reasonably logical human” could do became a general goal (Tegmark, 2017, p. 123). Who or what that reasonably logical human could be remained unspoken. Given the ongoing potency of a savage/civil binary for knowledge-production and claims to scientific status, however, it seemed to operate more in terms of a Man2. The reasonably logical human could already occupy the ontological zone of the full human based on his “nature,” amid the racializing, sexualizing and able-izing presumptions about his ability to reason. As Benjamin (2019) notes in *Race after Technology*, the issue in the early days of AI’s field formation were not about intention and identity alone, but rather a cluster of systemic elisions and provocations based on old models of humanhood.

Since the 1950s, however, research and technologies claiming the mantle of AI continuously challenged what was seen as a uniquely human capacity. In the decades after the Macy’s conference in the US, the difficulty of emulating whole human function was recognized, and the dream of a general AI was (until recently) less invested in, as the equaling or replacing of the total human complex proved too hard. The focus in the nascent computer sciences shifted and through the later decades of the 20th century specific skills and subsets of individual tasks, such as storage of information, calculation, and game-playing (e.g., chess and Go!) became the focus (Boden, 2018; Ford, 2018; Wilson, 2010). Chess especially was positioned as the *sin qua non* of intelligence in AI research. Chess suited the kinds of programming available insofar as the manipulation of symbols in chess and in mathematics matched the rule-bound and finite AI architecture at the time.

In the 1990s, once the world chess champion Gary Kasparov was defeated by the chess playing program, Deep Blue, new figures for programming emerged that tried to push beyond the limits of more rigid and fixed subject matters and architecture—the figure of the developing child and animals. Such figures emerge as key models for Research and Development, inciting the fields of brain development, neuroscience, and computer programming to start talking to each other across previous epistemological divides and overtly about affect (Wilson, 2010). Drawing on what are now called machine learning, deep learning and computer vision modeling, the exponential and disruptive technologies from the 1990s onwards were built on different kinds of computational and programming innovations, in which the human mind-body complex became not the sole referent or yardstick for what was seen as powerful.

Tegmark (2017) characterizes these shifts as three different versions of Life—Life 1.0 (the biological stage), 2.0 (the cultural stage), and 3.0 (the technological stage), locating current human-dominated circumstances within 2.0. Life 1.0 occurs “where both the hardware and the software are evolved rather than designed” (p. 17). The example Tegmark gives here is bacteria which he

sees as having DNA that specifies everything: “They never learn to swim toward sugar; instead, that algorithm was hard-coded into their DNA from the start” (p. 16). Life 2.0 he sees as current humanity “*life whose hardware is evolved but whose software is largely designed*. By your software I mean all the algorithms and knowledge that you use to process the information for your senses and decide what to do” (p. 17). This difference—the ability to design software in 2.0 “enables it to be much smarter than Life 1.0. High intelligence requires both lots of hardware (made of atoms) and lots of software (made of bits)” and to be more flexible, arguing that most of our software is added after birth through learning. Because none of us can transform and live for a million years or transform our cosmos “into a diverse biosphere that will flourish for billions or trillions of years, enabling our Universe to finally fulfill its potential,” a final upgrade is required, Life 3.0: “which can design not only its software but also its hardware. In other words, Life 3.0 is the master of its own destiny, finally fully free from its evolutionary shackles” (p. 29), which he argues many AI researchers believe will arrive during the coming century. The controversies that this launches Tegmark identifies as playing out along three major lines: the digital utopians who see AI technology basically as salvific, the techno-skeptics who see it as apocalyptic and reinforcing inequalities, and the beneficial-AI movement who see AI pragmatically, as “giving life the power either to flourish like never before or to self-destruct” and preferring the former (p. 34).

Research that embodies the possibilities of each of these trajectories typically occurs outside the field of education, yet that research has major implications for education’s continued existence as a sorter and constructor of “abilities.” A specific example is what is emerging through BMI research (brain-machine interface) in which brain-readability and brain-writability explore conduits between brain function and machines, uniting AI, neuroscience, and big data. A study recently reported in the *New York Times* (Velasquez-Manoff, 2020) captures the possibilities without necessarily considering the broader ethico-ontological stakes that techno-skeptics might raise. In the 2011 study, participants underwent a fMRI to have brain activity recorded while watching a film. The goal was to reverse engineer an algorithm so that it could construct, from brain activity and oxygen uptake, what a person was seeing. While the outcome did not capture 100% of the original film, the broad outlines were evident as “the reconstructed images moved with a dreamlike fluidity” (Velasquez-Manoff, 2020). The reconstructed images suggested how the details could be filled in with more precision in future years (see Nishimoto et al., 2011). Such studies are also suggestive of other possibilities. They intimate not only that the research already underway could “capture” what someone is seeing or thinking “in the mind’s eye” so to speak through non-invasive and increasingly more portable technologies, but also what could go in the other direction—what could be implanted in children, adults or potentially animals as a film, image, narrative, sentence, memory, disposition, emotion or affect from the exterior.

This prediction/eventuation of Life 3.0 points to questions over the emergence of man3 and his continued relevance, entification, and biology. These questions are ultimately entangled with the refiguration of ableist subjectivity in the wake of automation. From the “discovery of the unconscious” (Ellenberger, 1970) to AI, the fascination with automating both daily tasks that are unpleasant and larger jobs that a human could never perform has piqued. Today this includes not just earth-moving tasks handed over to heavy machinery or driverless trucks and cars, but analytical, quantitative, writing, drawing/design, and programming ones. As Peters (2017) has already forecast “workless societies” and “workerless societies” are now possible to imagine. Coupled with movements such as transhumanism whose express goal is the replacement of the aging human biological unit for a better carrier of “consciousness” different questions arise (Herrick, 2017): is *any* figure of Man necessary, and if so, in what form are his supposed capacities, abilities, or automative potentials to endure? Bostrom (2014) argues that such questions are not farfetched but emerging in the wake of something called superintelligence, where the aftermath could be far-reaching:

... the first superintelligence [that] may shape the future of the Earth-originating life, could easily have non-anthropomorphic final goals, and would likely have instrumental reasons to pursue open-ended resource acquisition. If we now reflect that human beings consist of useful resources (such as conveniently located atoms) and that we depend for our survival and flourishing on many more local resources, we can see that the outcome could easily be one in which humanity quickly becomes extinct.

Bostrom (2014, p. 141).

Superintelligence arises amid variations of AI that bear the traces of physics and neuroscience and that decouple the event of consciousness from the locus of an organ (Tegmark, 2017). Physics, for instance, contributes the idea that consciousness is an emergent phenomenon that arises through the re-arrangement of particles. Here, the concept of emergent refers to a state of being that shows “qualities above and beyond the properties” of the constituting particles themselves (p. 300). Neuroscience offers an integrated information theory (IIT), which describes the precise way of giving rise to such emergence of consciousness. When an event happens, “the information processing needs to be integrated,” i.e., “a conscious part” must communicate with the rest as “a physical process ... transforms the initial state of a system into a new [conscious] state” (pp. 301–302). The ramifications of these versions of consciousness in AI together with computer science’s basic understanding of “information as position” without substance/substratum (binary coding) enabled AI to make “the leap from brain to machines” (Tegmark, 2017, p. 299, in Baker and Wang, 2020). In other words, “it’s only the structure of the information processing that matters, not the structure of the matter doing the information processing” (Tegmark, 2017, p. 304 in Baker and Wang, 2020, p. 18).

In this trajectory, man3 is emergent, more or less an enabling confluence of multiplicities, operating as temporary place-markers or plateaus that form uneven pathways to the isolation of particular “qualities” that could most easily be decontextualized, unitized, coded, programmed, and recombined as a form of non-aging superintelligence. The irony here is that the ableist subjectivities associated with Man2 not only built the bridge to prizing such qualities, fostering their formation, and rewarding them in particular

forms through schooling and credentialing, but also potentially operated as the rationale for the demise of any figure of Man and “the human” that figure overrepresents for. As the processes of instrumentally rational and less resource-heavy knowledge-production accelerate to the point that not even programmers are required to program anymore, the rationales unleashed in Life 3.0 can potentially comport man3 outside of appeals to “nature” and in a format where Life-as-Information and Man as a costly composite system merge. The question remains as to whether such “systems” begin to exceed him and potentially, no longer need him in any “biologized” form whatsoever.

This underscores the absolute irony of colonization’s superiority effects, where the massification of the so-called “unfit” now expands to its ultimate point, no longer protecting “the colonizers’” zones of privilege. In such a moment, ableist subjectivities are not reducible to what the full human, not quite human, and nonhuman in Weheliye’s terms do to or signify for each other. Rather, the historical veneration of ableist subjectivity interlaced with the -isms born of Man1 and 2, their “reign” as a powerful sorter within an unquestioned distributive logic, has the potential to return full circle, redefining inferiority and inefficiency and annihilating the grounds on which “matter” and “empiricism” have previously staked their claim.

Conclusion: who-what?

Wynter’s recognition captured in the opening quote, of the tension between protecting a figure of Man who overrepresents and the potential annihilation of all as being the core challenge of this millennium, outlines the stakes and the trajectories of ableist subjectivities. From European-based Christocentrism (Man1) to the racialized nation-state (Man2) to the state of automation and non-physical substrate dependent versions of superintelligence (man3), the notion of human exclusivity has shifted, changing the horizon of enactment from the spirit to the flesh to the disembodied, from human centrism to human primacy to human non-necessity. The bases upon which ableist subjectivities have been founded have both interpenetrated these reformulations and adjusted accordingly, from faith in supernature to biological nature to systems thinking.

Ideas about intelligence have been one important bridge linking Man2 and man3 especially, albeit it in different forms. According to Malabou (2018), however, the next metamorphosis is yet-to-come. This prediction stands largely upon her reading of the pragmatism of Dewey and adaptationist psychology of Piaget. The shift is “the age of intelligence becoming automatic once and for all as a result of the removal of the rigid frontiers between nature and artifice. The power of automation by far exceeds a simple ‘roboticization,’ and the increasingly refined simulation of ‘natural’ intelligence makes a new approach to the brain incumbent—an approach that would not only make sense for biology but would also reveal the essential nature of its complicity with technological simulation” (pp. 15–16). On Malabou’s account, the collapse of nature and artifice will usher in a new era in which the biosocial and the socio-technium will not be able to be disaggregated. The running together of these terms is a temporary sign, because running together assumes prior separation and the bio and social or bio and techno will no longer be available to distantiation, making nonsense of claims to a “conflation.”

In educational discourse, though, any claim to newness is met with an at least bifurcated reaction. As the above has indicated, either, in techno-skeptic mode, man3 will just more cleverly mask inequalities and social injustices, hardwiring them into algorithms and other as-yet to be seen inventions owned and controlled by a select group, using them for automating Life and designating who-what matters, in the perpetual maintenance of an underclass. Or, in beneficial-AI mode, such technologies could undermine the historic foundations of inequality by eradicating the need for distributive logics altogether, taking the notion of an ontological hierarchy out of the game and opening onto a field of playfulness that honors the positive potentials of All. Inbetween sit already-existing children and youth, in already-existing schools and classrooms. What different professions, institutions and fields of education decide—and whether they get to decide—what should or could be forwarded of “the human” and left behind of the figure of Man is not an exercise in science fiction, decolonialism, or imagination. It is rather a crucial turning point where the moment for open dialog is contracting as the intensification and automation of abilities accelerates. As the 21st century unfolds, the responsibility for deciding in democracies at least what “we” are willing to share and what not needs revisiting and revision. Without the frank confronting of what ableism has supported and who-what - including more-than-human beings - it has not, the specter of the return which secures the demise of Man and “the human” he has overrepresented, remain on the table in the name of efficiency, superiority, profit, and reward.

Introduction: rise of the markets?

Our intention in this chapter is to consider the issue of inclusion from the perspective of marketization. How this affects inclusion is a moot point and has been a source of contention for the past three decades; especially around its implications for segregation and not only in locational but also in curricula and pedagogic terms (see for example [Bines, 1995](#); [Rouse and Florian, 1997](#); [Barton and Slee, 2010](#); [Norwich, 2008](#); [Norwich and Black, 2015](#); [Tomlinson, 2017](#); [Lui et al., 2020](#); [Thomas and Loxley, 2022](#)). Added to this are issues around diagnosis and assessment of “need” and the concomitant politics and logistics around the allocation, provision and distribution of resources; financial, material, and personnel. An important observation which underpins most critiques of the market is that far from being a neutral technical-rational “space” to facilitate a more efficient use of resources, it also brings with it issues around the moral and social valuation placed on difference—both collectively and individually. In echoing [Rix et al. \(2013a\)](#) comment on the special educational needs (SEN) “continuum,” does the existence of educational markets, which are intended in the parlance of economists to satisfy a range of preferences, reinforce “assumptions ... that some people or provision require segregation” irrespective of how or who provides this service? The creation of markets in educational “goods and services” and in particular sectors which were (or still are in the public domain) can be interpreted in two main ways. Firstly, there is a narrative which mostly regards marketization as a pragmatic solution to issues ranging from supply (and with it demand), the extension of personal and familial autonomy and choice into key areas of social life which were hitherto income and/or wealth contingent. It is important to note that this “choice” discourse is usually accompanied by the “raising standards” discourse. The competition for students between institutions should galvanize schools into being attentive to the quality of their services (see for example [Biggar and Fels, 2017](#)). The second narrative takes a more expansive view and is an attempt to provide a theoretical explanation for marketization as a phenomenon which has seemingly penetrated many facets of social life and creates a very different cultural dynamic and relationship between educational institutions and the communities and the individuals with whom they are connected.

Although space precludes a detailed unpacking of these narratives, we will consider them mainly in relation to some of the structural and cultural changes to education systems via policy interventions. Although our focus in this chapter is predominantly on the UK as a critical case of marketization and how it has evolved over the past 40 years vis-à-vis inclusion, it is a “tale” of reversals as the commitment to inclusion has been abandoned as a national policy goal by successive Conservative governments since 2010 and replaced with a policy which valorizes a highly individualistic and reductive conceptualization of SEN and a position which castigates inclusion as “an ideology conceived on spurious egalitarian grounds” ([Conservative Party, 2007](#); see also UK [Cabinet Office, 2010](#)). We will start with a discussion regarding the role of policy as an instrument to shape and form educational systems and practices. Next, we will provide a brief overview of the recent socio-political origins of marketization and its role in restructuring welfare provision and education. This will be followed by a discussion of how this process has affected special education and inclusion.

The role of policy: Caveat emptor?

Our twin emphasis on markets *and* policy is to reinforce the notion that policy is and has been a critical instrument through which to reinforce or restructure many areas of social life. Given the centrality of education across most states it has historically tended to be subject to near-constant policy interventions. We would argue that it is important to recognize that special education forms a small but relatively substantial component of the state welfare system.¹ This, we believe, is an observation that tends to become

¹Put in numerical terms, in the UK in 2022, SEND pupils comprised 14% (1.1 million) of all pupils and in 2019 [latest data] accounted for £9.4 billion in expenditure or 10% of all education spending of £94 billion) (see [NAO, 2019a,b](#) for detailed unpacking of SEND statistics). In 2022, 27% (or 355,566) of SEND pupils held were subject to an individual “Education, Health and Care” (ECH) plan and 12.6% of all school-age pupils were deemed to require some form of support. Of those with an ECH, 51% attend a state maintained special school—an upward trend since 2006 ([DfE, 2022a](#)).

obscured in many discussions about special education.² In this sense, any change in the wider welfare regime can and does have an influence on special education. An awareness of welfare reforms and restructuring is a prerequisite to a critical understanding why special education takes on its particular “shape and form.” In this regard we should not view special education as being insulated from the welfare state but is equally subject to the vicissitudes of macro as well as meso changes. This does not detract from the day-to-day pedagogical, learning or support work that is “practice,” but implies that much of this is framed and constituted in and through policy. Some of this work is more immediate such as documents like the Special Educational Needs and Disability (SEND) Code of Practice (UK Gov, 2015) which sets out in fine-grained detail how a school should frame and undertake its work with students who present or have a Special Educational Need (SEN) or disability. Some of this may be more distal in the case of the complex regulations for the purchasing of social care provision as part of an individual’s education and health care plan (UK Gov, 2014); in itself a product of quasi and actual marketization of health and social care services since the 1990s. But nonetheless these policy assemblages all become entangled within what Foucault (2002) would refer to as a “grid of intelligibility” when the connections are drawn together.

As we have argued elsewhere (Thomas and Loxley, 2007, 2022) the social categorization of children and young adults as somehow being “special” is constructed in and legitimized through the kind of policies that “speak” about them. They are, as Foucault (2002) would characterize it, embroiled in a web of discursive practices and regimes. This is as much a historical as it is a contemporaneous proposition. However, in broader terms, these systemic and cultural dimensions are located in what Esping-Andersen (1999) would characterize as welfare regimes. That is wider configurations and networks of welfare agencies and organization which are underpinned (or at least nominally) by (usually) abstract ideological notions which shape and pattern what Cox (1998) refers to as “principles” and “measures.” The former is concerned with the values which structure the regime and the latter the means through which principles are instantiated (i.e., put into practice). The former refers to the values or abstract ideals (“child voice,” “the market,” “parental preference,” “school autonomy” and so on) which constitute policy goals. The latter, “measures,” are concerned with *how* these values are “operationalized” or in Habermas’s (1987) terms brought into the lifeworld or more prosaically, the day-to-day practice of education. In echoing Ball (1994, 2012) policy measures come in multiple and for the most part interacting, conflicting and contested forms (whether oral, lexical-graphical, numerical and artifactual) and “exist” within a variety of interacting layers and contexts (e.g., legislative, financial, institutional, logistical, organizational, professional as well as “folk” norms and practices).

Clearly, any shift or redefinition of principles will bring about a corresponding change in measures—that is to say, the “instruments” or in the words of Foucault (2008), “technological apparatus” applied to making policy “work.” However, in echoing Starke (2006), we need to be analytically sensitive to at least three interconnected factors which condition policy and our responses to it. The first is “path dependency” or being attuned to the way historical antecedents act as constraints (as well as opportunities) on policy. The second is the “institutional” which refers to the durability and reproduction of norms and values (e.g., universalism or particularism, primacy of professional knowledge and decision making over other groups such as parents or administrators etc.), which shape and give rise to the organizational forms in which policy is generated, translated and enacted. Lastly, there is “politics” whereby various interest groups (such as political parties, non-governmental organizations [teacher unions, parent groups] & agencies) vie for influence, control and definitions of problems and proffered solutions. All of three of these factors form a dense and reciprocal network, in which (and to paraphrase Marx, 1926) people make policy but not always under circumstances of their choosing.

On one level, policy can be viewed in simple terms as representing normative guidelines for action or in Colebatch’s (2006) terms the “creation of order”; that is, it sets out how things *should* be done. Although this conception is useful to a point, as policy is concerned with defining objectives and in some instances the means through which they are attained, it is nonetheless rather generalized and largely instrumental, inadequately capturing the many ways in which policy is constructed, interpreted and subverted. Measures are not just a set of written precepts which we can easily exercise agency over; at work is both coercion and consent (see Ball et al., 2012). In this regard policy is not neutral, though ostensibly it may appear to be so via the use of discursive strategies to obscure intentions and/or sectional interests. Allied to this is the notion of policy as a signifier for underlying and stratified social relations of power, which crucially can be a vehicle for re-ordering and/or reinforcing these relations. When placed in an international context, there is no isomorphic relationship between principles and instruments; an observation well made by Rix et al. (2013b) fifty-five country study of SEN systems and policy orientation to inclusion. Here they found a generalized commitment to inclusion (the “principle”) but very little commonality in relation to how inclusion was operationalized (the measures) across a range of dimensions. These included for example issues related to “space” (types of schools), “grouping” (practices vis-à-vis the homogeneity or heterogeneity of students in classes based on certain criteria), “staffing” (role of practitioners, skill levels, attitudes toward inclusion), “students” (rights, characteristics i.e., definitions of SEN, how needs should be met) and “systems” (legislation, funding, services etc.).

²Additionally, SEND is not solely an educational “issue” but for a number of children & young adults and their families, one which intersects and interacts with health and social care domains—each of which require navigating and are subject to their own respective organizational and cultural logics. But this is nothing new and has been a problematic feature of the SEN “system” for decades. Therefore, the reading of any SEND policy needs to be quite literally a hermeneutical exercise; a gathering together and interpretation of what Ball (1994) called an ensemble of related texts in order to make sense of any single policy.

Principled objections: why markets?

The position given to markets (imaginary or real) and its centrality to neoliberal (and a lesser extent neoconservative) cultural politics has been subject to significant and substantial deconstruction, critique and commentary since the late 1970s across a variety of disciplines (see [Thomas and Loxley, 2022](#) for a summary). This would have remained a mere academic curiosity had not political administrations, notably in The Conservative Party government (1979 until 1997) in the UK and The Republican Party government (1980–1994) in the US, taken on anti-welfarist and pro-market agendas. What followed was that over nearly two-decades a range of social and economic policies were heavily influenced by the so-called “New Right”—not so much a movement, but a disparate collection of think-tanks, politicians, academics and pseudo intellectuals (see for example [Hall and Jacques, 1983](#) or [Levitas, 1986](#) or [Young, 2013](#)). At the center of the New Right polemic—both neo-liberal and neo-conservative—was the argument that the state and particularly such institutions as education, health and social security as they have evolved during the latter-half of the 20th century, had according to [Newman and Clarke \(1994\)](#) created three interrelated concerns:

- *moral*: welfarism had generated a culture of dependency underpinned by anti-capitalist values and sentiments;
- *financial*: high public expenditure and borrowing required high taxation and interest rates which “de-incentivized” work; and
- *social*: the repression of individual freedom and autonomy.

As we have noted elsewhere, these sentiments formed the political and ideological bedrock of policy during the 1980s and up until the mid-1990s. They were also fundamental to the reconstruction of a new role and purpose for state welfare which was accelerated in the late 1990s and became firmly embedded in the 2000s and 2010s. The dismantling of the post-war universalistic conception of welfare and the emergence of particularism as the new organizing concept in Britain has had profound implications right across all the main state welfare agencies: health and social care, social security and education ([Levitas, 2005](#); [Powell, 2008](#); [Taylor-Gooby, 2011](#); [Exley, 2012](#)). As noted previously ([Thomas and Loxley, 2001](#)) this guiding force in state welfare, coupled with shifts toward ostensibly decentralized forms of control and governance, the extensive use of marketization and “contracting out” of many services previously operated by the state, along with the reframing of client–professional relationships around concepts of “empowerment,” have had and are still having a profound impact on provision. It is useful to note that the existence of the state as an institution was never in question (other than by the more anarcho-right-wing libertarians), as it has been central to not only the restructuring of welfare provision, but the creating and “nurturing” (of) a specific type of cultural dynamic which is suffused with the core neoliberal and neoconservative values. [Foucault \(2008\)](#) in his discussion of neoliberalism—via his concept of “biopolitics”—saw this in terms of the “entrepreneurial self.” As [McNay, 2009](#) notes this is where the boundaries between the economy (its values and norms) and in particular market activity colonizes and dissolve into other spheres of social life to become the new doxa:

The autonomous citizen is s/he who manages these diverse networks—work, household, pension, insurance, private property—in the most responsible and prudent fashion vis-a-vis the avoidance of risk and the maximization of their own happiness.

[McNay, 2009](#) p. 6.

But the “entrepreneurial self” is not just a conscientious and independent citizen, he/she is also an individual who re-makes themselves in order to create and pursue opportunities in line with their own self-interest and not those presupposed by for example the state. This is neatly captured in the notion of “human capital” (an active investment in the self), which if judiciously undertaken should yield future returns, financial or otherwise. Education, which for most of us is a fundamental positional good in terms of our material and non-material well-being is an obvious example vis-à-vis neoliberal ideology.³ The role of the state in all of this is to create and maintain the conditions through which the entrepreneurial self can flourish. But as [McNay, 2009](#) also notes (echoing Gramsci), this is a form of governance which needs constant intervention and attention. This hyper-individualism can create a diminution or negation of social bonds, whereby our interactions with others is one merely based on self-interested transactions with little or no regard to their well-being. This line of reasoning is echoed in the work of [Beck and Beck-Gernsheim \(2002\)](#), [Beck \(2007\)](#) and [Giddens \(1990\)](#) who discuss this in the context of what they characterize as “reflexivity modernity” and “individuation.” Put simply, they argue that one of the defining features of late-20th century capitalist societies in particular, is the loosening of “tradition.” In this sense tradition refers to the acceptance of and reproduction generationally, of social roles and positions based on for example class or gender norms. Without wishing to generalize or be too deterministic, middle class/working class children go to middle class/working class schools and then onto middle class/working class occupations (via some form of tertiary education). These progressions become unquestioned rites of passage. The break with tradition comes via this sense of individual reflexivity whereby new horizons of possibility and choices are considered and more importantly seen as attainable. The genealogy of this structural and cultural shift is for Beck and Giddens multifaceted but rooted in changes in economic and occupational structures, a form of consumerism which valorizes individual difference and the welfare state itself. For example, and in very simple terms, access to higher education for young working-class adults becomes feasible as structural as well as cultural “barriers” are lowered or removed and with it a change in life chances which were not possible or at least highly improbable for their parents. However,

³Though markets are more problematic for the neoconservatives with a more traditional concept of what constitutes “an educated citizen”—a tension well discussed in the early critiques of marketization in the UK (see [Bash and Coulby, 1989](#); [Jones, 1989](#); [Ball, 2009](#)).

Beck also argues that this do-it-yourself approach has a number of attendant risks as one becomes removed from one's tradition. The potential for the dissolution of social bonds (family, peers, location) in the pursuit of a different self-directed trajectory is ever-present and may lead toward alienation (see for example [Kearns, 2018](#)).

Back to the market

The application of markets in educational contexts is not a new phenomenon. Most countries' systems are structured and organized around mixed economies of provision (UNESCO). These tend to be built around clusters of private (for and not for profit) and public (state funded) institutions found across most sectors (pre-school, primary, post-primary tertiary). However, how this "mix" is culturally and structurally configured is highly context contingent. The range in terms of sector density (e.g., ratio of private to non-private institutions), mode of organization (selective versus non-selective), types of funding mechanisms (public to private transfers, fee charging), employment regulations, patterns of ownership, curricula autonomy and so on are "worked out" That is, each country will have devised or evolved its own market frameworks based on their own cultural, social, political milieu ([Starke, 2006](#); [Gingrich, 2011](#)). A technical, but nonetheless critical consideration when discussing the structural contours of educational markets are, how is it configured? The most obvious markers of difference between public and private provision pivots around the question; "who pays"? However, what constitutes "private" as applied by the [OECD \(2018\)](#) is not straightforward as it is a mix of factors related to sources as well as the proportion of funds (e.g., from households, non-governmental organizations [charities, religious groups], transfers from the state), ownership (related to land, buildings) as well as managerial control over the school or institution, regulations determining curriculum, employment conditions, student enrollment, student exclusion and so on. Lastly, there is the distinction between "government dependent" and "government independent" private institutions. The former derives 50% or more of its core funding from the state and the latter 50% or less. According to the [OECD \(2021\)](#) most funding for the compulsory sectors (primary and post-primary) is derived from public sources. For the pre-school and tertiary (higher education) sectors the source of funding is much more variable. In comparing what the OECD/UNESCO categorize as "household expenditure" on education (predominantly tuition fees) with "public sources" for primary and post-primary, the former is on average 8% with 90% coming from the state. The country with the biggest differential is Chile (29% and 71% respectively); in Sweden public sources account for 100% of school expenditure. For tertiary education on average the state contributes 66% and households 44%. An added complexity is that source of funding does not by itself indicate the extent of marketization.

In the case of England, an example of a highly marketized system, 72% ($n = 2888$) of post-primary schools are deemed to be "private" but are recipients of direct state funding. As such individual users (the principal) i.e., parents/careers pay no tuition fees to the schools (the agent). This is what [LeGrand \(1991\)](#) refers to as a quasi-market. Although the English system has undergone numerous changes over the past 30 years (mainly around diversification of school type, regulation & monitoring ownership and control) these have not substantially altered this operational model since it was introduced in 1988. In this sense this type of market possesses all of the features of a non-quasi market: many buyers (parents/carers) and sellers (schools), access to and the production of information regarding the service/product, and mechanisms to express preference and/or choice. What it does not have is a price mechanism to regulate relations between buyer and seller which is one of the defining features of a real market, nor are they meant to be profit seeking.

The cost of educating a child or young adult is determined by the state (local and central) via formulas whose basic unit is the individual pupil. The competitive logic of the market is brought about by the necessity to attract and retain students who literally have a "price on their head."

Added to this is a mode of devolved management which allows schools to view themselves as autonomous units and act in ways which would through their curriculum offerings and pedagogical practice to: (1) attract pupils via parental preference; and (2) create a basis for growth. Schools which did not attract enough pupils to cover their costs either had to reassess their position to reverse this trend or run the risk of failing altogether. Ironically, for all the political attention given to markets and a faith in their redemptive power, the evidence for their effectiveness is patchy at best.

And what about inclusion and special education?

If we were to locate a "policy fulcrum" in all of the structural reforms which has problematized SEND from 1988 onwards it would be: (1) resourcing; and (2) performativity in the guise of fostering competition between schools to "raise" standards. Both have been extensively debated in relation to inclusion and SEND in particular and represent key signifiers for the critical tensions and contradictions in a system organized around and predicated on marketized (quasi or otherwise) forms of behavior. From the outset this simplistic notion of the "money following the pupil" based mainly on the number of pupils in a school worked as a disincentive (or created a market failure) to admit children with an SEN as the money "attached" to them would not cover the expense of their additional supports. Even with the introduction of financial compensatory mechanisms used by local education authorities (LEAs) in the early days of marketization, this still proved highly problematic ([Loxley, 1999](#)) and remains so ([NAO, 2019a,b](#); [LGA, 2020](#)).⁴

⁴These have gone through numerous permutations since the early 1990s and now comes in the form of the "pupil premium" based on the number of pupils registered for free school meals—a "traditional" proxy indicator for socio-economic disadvantage—and the "dedicated school grant." The latter is intended to be ring-fenced funding allocated by the central state but used by local authorities to support schools and their "high needs" pupils.

If mainstream schools were left to endure (as intended in the 1980s) the oxymoronic creative destruction of the market to “up their game,” special schools seemed to fare very much better. Although devolved management was extended to special schools it had a very different flavor to that of their mainstream counterparts which put them outside of this new market regime. This was largely due to the recommendations of the accountants Touche Ross (1990) who were put in charge of the process of extension. Their train of activity in doing this was to ask those in the system, including special school heads, how they thought special education should be funded. The conclusion, perhaps unsurprisingly, reached by the accountants was that special schools were often “centers of excellence” and that they should not be allowed to wither on the vine as children moved outside the system to the mainstream. They were thus funded according to the number of *places* (whether they were filled or not) at special schools; a model which is still in place. In much of the writing on SEN and policy, special schools, which form a significant component of the SEND “ecosystem” tend to get overlooked. In blunt numerical terms there are 1298 schools (995 are state maintained, 247 independent and 58 non-maintained) that accommodate 142,028 pupils who account for 53% of all pupils and young adults with an ECH plan. Although the number of state-maintained schools has declined since 2002 ($n = 1161$) the number of pupils has increased from 2006 onwards. The average annual cost per pupil is £25,000 for maintained special schools and £50,000 in an independent school and account for £2.3 billion or 25% of the annual SEND expenditure in England and Wales (NAO, 2019a,b); independent special schools alone cost £957 million. In comparison it costs £6000 per year per pupil with an ECH to be educated in a mainstream setting.

In going beyond this headline data, in policy terms over the past 40 years the diminution or indeed dissolution of the special school system was never part of the SEN agenda (see Norwich, 2008 and Rix, 2011).⁵ If anything, the role and position has been reinforced in three main respects. Firstly, the creation of new types of schools. New Labor’s inclusion in the 1998 Standards and Frameworks Act for the establishment of a Foundation or Community of Grant Maintained special schools signaled very loudly that their model of inclusion saw a place for these institutions. The legacy of this found its way into the Academy School Act (2010)⁶ which allowed for the setting up of special academy and special free schools (DfE, 2022b) which unequivocally cohered with the Conservatives’ anti-inclusion agenda (see Conservative Party, 2007). Indeed, the latter bemoaned the closing of schools under New Labor. Secondly, there has been the reinforcement of the role of the special school as a local center of excellence, whose expertise can be drawn on to support their mainstream colleagues. This formed a part of New Labor’s position (DfEE, 1997; DfES, 2001; HoC, 2006) as well the Conservatives’ (DfE, 2010). In its more radical form special schools labeled “outstanding” by the Office for Standards in Education (Ofsted) can offer initial teacher education programs. Thirdly, there is the all-pervasive notion of parental/carer empowerment which again is articulated via the use of the discursive (or rhetorical) mechanism of “choice” through diversity of provision. A further legacy of not only the expansion of the system, is the funding mechanism itself. With the money staying with the special school, there is little finance freed up to fund children when they are mainstreamed. The widely accepted recommendation from Touche Roche was, however, at variance with the body of empirical evidence in education which has consistently indicated that in outcome terms special schools are no more effective than mainstream schools (see Thomas and Loxley, 2022). There was no educational or inclusive rationale for the assumption about “centers of excellence”; the rationale pushing the reform of management into the special school arena was identical to that driving it in the mainstream arena. It was a rationale constructed out of the imperatives of the market which was paradoxically intended to “protect” them from the volatilities of the market.

There is also a further effect of this which concerns the LEA. Accompanying the long ascent of the market, the past 10 years, in particular, has seen the demise of what used to be known as the local education authority (LEA). This is in contrast to the role of the LEA that was promoted in the late 1990s from a government committed to inclusion and was different from the residual-provider approach that developed between 1988 and 1997 (Loxley, 1999). Its role as seen from the perspective of central government has been mapped out in a number of policy initiatives, which had their objective recalling the LEA from “exile” (Audit Commission, 1992; DfEE, 1997; Ofsted, 1999). However, with the advent of yet more Conservative administration New Right ideology *inter alia* Academy Trusts, academy schools and to a much smaller extent free schools, the LEA now downgraded to just a local authority (LA) finds itself occupying the residual-provider role once more; a minor player within Ball’s hetroarchy. However, one of the key (and historical) residual activities is the administration, though not necessarily the provider of SEND services. This has long been an area of contention and critique since the early 1990s (Lamb, 2009; DCSF, 2010) coming from both state agencies and parent groups. The past 10 years have not been kind to local government:

The system for supporting pupils with SEND is not, on current trends, financially sustainable. Many local authorities are failing to live within their high-needs budgets and meet the demand for support. Pressures—such as incentives for mainstream schools to be less inclusive, increased demand for special school places, growing use of independent schools and reductions in per-pupil funding—are making the system less, rather than more, sustainable.

NAO (2019a,b, p. 11).

The issue of the relationship between “needs” and “resources” as shown above, has long been fundamental to debates around inclusion. Despite the long-standing prevalence of a “continuum” which is supposed to an expression of the magnitude of resources required to support a pupil, this tended to be driven by administrative categories based on fixed and largely reductive conceptions of “need” (Tomlinson, 2017).

⁵In borrowing from Kohn (2020) special schools are a type of non-universal public goods provided by the state which can be collectively consumed but are preferred only by a sub-set of the population.

⁶For critiques of this program see Ball (2005, 2009, 2015).

Like a form of alchemy, this is further compounded when attempts are made to cost these activities within a system which is constructed around a performative calculus. As argued by Penna and O'Brian (1998) and Taylor (1998), there is also an underlying shift from the politics of provision to the politics of identity which is partially bound up with critiques of the inflexibility of universalism and the role of the state (national and/or local) from both the left and right sides of the political spectrum (see Ranson, 2003; Ball, 2005, 2012; Gingrich, 2011; Diamond, 2013; Hicks, 2015; Ball, 2018; Ball and Bowe, 2020; Kohn, 2020). Cox (1998) suggests, this is further exacerbated by the displacement of welfare based on "social rights" to a regime constructed around "discursive rights." In the case of the former, social rights are concerned with equal access to education, healthcare, financial support if unemployed. Although in principle each citizen has an equal right to all of these, access and/or entitlement is mediated via the use of specific rules to determine eligibility and equality of treatment. This is referred to as "conditionality." In this sense, rule-governed patterns of allocation conform to the notion of distributive justice in that what people get is based on the fair and unbiased assessment of their needs. For the latter, discursive rights may be read in terms of empowerment and the positive acknowledgment of difference it can equally be conceived of as a competitive struggle over the definition of needs and associated resources played out within existing as well as reconstructed institutional arrangements (see Tomlinson, 2012).⁷ In this sense, the mobilization of interest groups endlessly engaged in strategic maneuvering becomes paramount. The corollary of this is that those individuals who are "disenfranchised" or belong to groups which simply lack the resources to acquire resources become further disadvantaged. To say whom gets what depends on who shouts the loudest. Distributive justice maybe, in other words, insufficient when calculations about putative need are based on representations made by groups or individuals that, in turn, have access to varying "social capital" and "cultural capital."

In coming back to the "principles" and "measures" which directly connect with the above discussion over rights and needs, is the bringing of parents/carers into the SEND market-place for the purchase of resources. This is articulated by current policy stemming from the most recent legislation governing special education, the Children and Families Act (2014) regarding "need" and resource allocation. Firstly, the legal requirement for local authorities to provide the "local offer" i.e., what services and resources they have and secondly, the introduction of Personal Budgets for pupils with an Education, Health and Care (EHC) plan. The former is based on recommendations from the Lamb Inquiry (2011) and Ofsted (2010) regarding poor practice regarding the quality of information available to parents/carers and the later the extension of longstanding initiative within the domains health and social care (for a comprehensive overview see Martinez and Pritchard, 2019; also Fleming et al., 2016, also UK Gov 2009 and DoH, 2012). However, in echoing Chow and Bracci (2020), what is intended to be a measure to provide a degree of autonomy for pupils and their families regarding decision making over resources, it can be read (and particularly so in the context of the principles of marketization), as an extension and deepening of the entrepreneurial self through the exercise of rational and informed consumer sovereignty and no real diminution of state surveillance and control via a matrix of regularity mechanisms to ensure responsible appropriate and accountable behavior (see UK Gov, 2014).⁸ It can also be seen to fit with Foucault's notion of the dual productive/oppressive nature of power. Chow and Bracci (2020) also ironically notes that one of the major goals of disability groups since the 1970s has been to reduce their dependency on the state through instruments such as personal budgets. But there is also within this a well noted and enduring distributional effect, in that certain kinds of need and their presumed etiology work within existing socio-cultural frameworks mediated disproportionately via for instance gender, ethnicities and social class (see Tomlinson, 2015, 2017; DfE, 2020).⁹

By way of a conclusion: market governance and governance by markets

In this short review of marketization and its effects on inclusion we would echo Jessop's (2015) observations about how the further entrenchment and extension of marketization have fundamentally altered the role of the state in how it positions itself vis-à-vis welfare provision and more significant relationships between the state and its citizens. One could be pragmatic (or optimistic) and view the market as a vehicle for resource allocation which takes individual preferences seriously. However, as we have tried to show, sadly the market as envisaged by the New Right has become a device and mechanism for reinforcing as well as justifying a particular world view and specifically one where individual difference is largely seen as stratified rather than complex and many-faceted. The "theoretical" noise of social-Darwinism is never far below the surface.

In looking at this, one has to be aware of the role of policy as used by the central state in creating and sustaining conditions which foster or discourage inclusion as a policy goal. Hence it is essential that we explore how marketization has operated in instantiating policy objectives. As an example, one can look at what the UK government's own National Audit Office (2019, 2021) has said about the use of public funds in systems that purport to support inclusive solutions to children's difficulties at school in the context of

⁷Just to complicate matters "need" can be conceptualize via the following forms: (1) Felt need—which is subjective (2) Expressed need—which is mobilized into some form of "campaign," (3) Normative need—as defined by welfare professionals and (4) Comparative need—judged according to relative needs of groups.

⁸At the time of writing, 25,300 (or 5%) of EHC plans also included a personal budget component (DfE, 2022b). Over 500,000 of them are active in the area of social care. For health care this is 124,000 (NHSt, 2022b) with an intention to increase this to 200,000 by 2024.

⁹More males (15%) than females (8%) have some form of SEN support and 4% and 1% respectively have an EHC plan. 28% of pupils eligible for free school meals (a proxy indicator for familial economic disadvantage) are labeled SEN as opposed to 13% of pupils without an SEN (DfE, 2020). 20% of pupils of Black-Caribbean origin have either SEN support or an EHC, in comparison to 8% of Asian-Indian pupils who numerically form a much larger group (268,318 as opposed to 86,543). And in echoing Tomlinson (1982, 2012, 2017) some "needs" such as those with an assumed bio-medical origin are more "desirable" or at least less stigmatizing than others.

budgeting within the quasi market. The [National Audit Office \(2019a: 8\)](#) noted, “The main reason why local authorities have overspent their high-needs budgets is that more pupils are attending special schools.” It proceeded to note that “Between January 2014 and January 2018, the number of pupils in special schools and alternative provision rose by 20.2% ... Spending on independent special schools increased sharply—by 32.4% in real terms between 2013–14 and 2017–18.” Here, one can see how the notion of inclusion as “an ideology conceived on spurious egalitarian grounds” ([Conservative Party, 2007](#)), as we noted earlier, has materialized. The abstract notion of “spurious egalitarian grounds” has taken corporeal shape via the increased use of not only maintained special school places but—even more so—the use of private special school places.

Policy is a deeply political process, and it is imperative that we interrogate the principles on which policy is based. In the UK, the market was adopted by both right and center-left wing governments, which, though they shared some value positions, did have different conceptions of what a market could or should do. While it is reassuring to see that inclusion—as for example advocated by the Convention on the Right of Persons with Disabilities and the Convention of the Rights of the Child—is enshrined in legislation in the vast majority of the countries (of whom 73% profess a “policy guarantee” regarding “integration” into mainstream settings (see [Waisath et al., 2022](#)), the abandonment of this commitment in the UK in particular, demonstrates the fragility of values and how quickly they can be expunged based on superficial evidence and ideological posturing. In the context created by marketization, social rights, however problematically administered, assume the status of being an “optional extra.”

The now near hegemonic discourse of the New Right with its emphasis on individualism, the free market, tradition and the family makes alternative versions of the “good society” difficult to pursue as schools and parents/carers become, whether they wish to or not, players in a game in which the rules constantly change. The elaborate regulations devised by the state to mitigate or police the negative effects of markets such as “cream skimming” by schools or “monopsony” by parents/carers or simple “market failure” is testimony to the flawed logic of educational markets, or at least those driven by a particular form of competition. Much of the policy it has enacted has been inimical to inclusion. Expressions about the need for a plural, tolerant, inclusive education system sit uneasily with policy that foregrounds the benefits of choice, selection and the comparison of schools on the basis of their pupils’ attainment.

Where can we go from here? How should we face up to these challenges? Elsewhere ([Thomas and Loxley, 2022](#)), we have suggested that inclusion seems to wake up each decade to a “Groundhog Day” to relive and re-confront barriers facing it not only from politics but also from its own history of managing “special needs” and from its heritage of research methods. We have focused in this piece on the political, policy and structural influences—notably via marketization—shaping practice and pushing it, seemingly inexorably, away from the direction of inclusion. It is the case, though, that many of the institutional practices operating in education systems are appropriated and employed by such structural influence in maintaining segregation and exclusion. The research we use, the thinking we employ about failure, the words and ideas that we use to discuss the *point* of education, and the ground-level activities that we can engage in—all of these can and must be considered in challenging a political orthodoxy that is inimical to inclusion.

As far as research is concerned, we can work to develop models of research in looking at inclusion that respect the idiosyncrasies of particular situations and cultures, simultaneously eschewing the sterile “helicopter research” ([Thomas and Loxley, 2022](#)) that imposes “What Works” solutions on teachers and schools.

As to the thinking we employ about failure, we can surely encourage intersectional understandings of difficulty at school. Such understandings recognize that failure at school is usually less to do with “disorder” or “disability” and more to do with context, culture and community in the extraordinary circumstances that school environments present to many children and young people.

About the *point* of education, academics and practitioners can encourage a discourse wherein, as [Biesta \(2007: 1\)](#) argues, we “... keep in view education as a thoroughly moral and political practice that requires continuous democratic contestation and deliberation.” We can reflect, as [Biesta \(2020\)](#) recommends, on the *point* of education. We can move away from words in our own discourse such as “effective” and “efficient” with regard to education, and substitute for them words such as “worthwhile” and “meaningful.” Biesta suggests that “effectiveness” is never an educational good in itself, only becoming meaningful in relation to views about the purpose(s) of education. And “efficient” education, so beloved of legislators looking segregative solutions to accompany and support marketization, should perhaps be expunged from our vocabulary entirely.

Last, teachers, researchers and academics can selectively challenge local and national policy that acts to exaggerate difference. Rarely is concerted action taken against local or national legislatures to challenge unjust or inappropriate measures, instituted by politicians on populist platforms such as “improving standards.” Teachers may feel powerless in these arenas but [DeMoss \(2003: 61\)](#), [Sailor \(2015\)](#) and [Kopanke \(2020\)](#) review evidence which—in the USA, at least—shows that such action can help to decrease disparities, whether or not plaintiffs directly succeed in their claims. DeMoss notes: “States seem to respond to the pressures that litigation places on them to take a closer look at the ways they fund education.”

Many of the problems we have discussed are, of course, structural, created by a political system which has little real interest in change. But progress depends on more than changes in politics and policy: the field needs to go well beyond inclusive education’s historical preoccupations and grasp the insights that come from intersectional understandings of failure and unhappiness at school. It needs to stop seeking new syndromes “explaining” failure and to argue powerfully against the use of such syndromes to rationalize the difficulties students experience with life at school. It needs to go beyond failed models of inquiry that cement in place age-old diagnosis-and-treat pedagogy. It needs, in short, to trust in the intelligence of the teacher and to empower the teacher in challenging an ideology that is hostile to inclusion.

Introduction

I began my life in teaching as the coordinator of a “special needs unit” in a New Zealand rural high school. While I have many memories of my work with students, one is particularly salient:

I remember Bill (not his real name), whose apparent shame at being associated with the unit was evident in the way he sought to leave S2 (euphemism for the unit) before the bell went. He would surreptitiously check that no-one was outside before scurrying out the door of S2, to reach the safe anonymity of the quad, where his demeanour changed from one of furtive urgency to nonchalance, as if he’d just stepped out of a “regular” class. I see myself now as an accomplice in this act, knowing that I could incur the principal’s wrath by this early release from class, yet considering Bill’s self-worth and dignity worth the risk. I thought it futile to further alienate him from school by insisting he spend a few more minutes on an academic task. In that time before the bell, his thoughts had already moved from learning to read to how he could get out of (escape?) the unit without being seen by his “normal” peers. Looking back, I realize that Bill’s response to “special” education served as a powerful lesson in its limitations and even harmfulness. Along with other students I had the privilege of learning with and from, Bill’s actions highlighted for me the wrongness of special education, and the need to work for and within a more equitable education system, in which students are not marginalised because of their human difference. Bill taught me that education should never shame.

Some 30 years after crossing the threshold of my first class as a new high school teacher, I continue to witness how damaging education can be for some students, based on inherently flawed assumptions about what it is to be human. My own experiences as a teacher and now teacher educator are echoed in a growing body of research that documents students’ educational experiences from their own perspectives (e.g., [Connor and Cavendish, 2020](#)). This literature reiterates the imperative of valuing children and young people’s perspectives about their worlds, as mandated by the United Nations Convention on the Rights of the Child (UNCRC) ([United Nations, 1989](#)) and the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) ([United Nations, 2006](#)).

The purpose of this chapter is to examine the emotional impact of markers of difference that mark the development of many students’ identities as “full-fledged human beings” who are “capable of achievement and worthy of respect” (Lipsky and Gartner, 1987, p. 69). The importance of such inquiry is emphasized by Jóhannsdóttir et al. (2020) in their research regarding the impact of shame on disabled young people. Defining shame as “psychological pain” derived from thinking of oneself as flawed and “lacking dignity or worth” (p. 4), they emphasize that shame cannot be conceptualized as an individual matter only, and that its “social determinants” (p. 4) must also be considered. How do external social factors, such as dominant exclusionary ideologies, structures and practices affect how students feel about themselves—who they are and who they may become? How can teachers/schools, who have the power to change mechanisms of marginalization, offer *all* students equitable educational opportunities to flourish in life?

The chapter begins with students’ interpretations and affective experiences of disability and education, which are interpreted within a framework that draws from theoretical concepts of disability and justice. The chapter then outlines what can be done within teacher education contexts to address often uncontested educational wrongs that can warp students’ lives.

Understanding students’ experiences of school

[Don’t] focus too much on the fact that you’re different, just, be yourself and usually things will, probably work out for you.

Ethan, cited in Jessup et al. (2018, p. 94).

This section draws from a range of international literature in which disabled students share their thoughts about school. While it is beyond the scope of this chapter to review all relevant research, the material chosen relates to students in both primary/elementary and secondary/high school contexts in multiple countries. Most of the sources were published between 2017 and 2020. Numerous student quotes are threaded throughout this chapter, to show respect for students’ own words.

Disability: a bad thing?

Is it ok to have a disability? ... Can I tell people that I have Down syndrome?

Minal, cited in Lalvani (2015, p. 14).

That disability was regarded as never a “good” thing, and that something was “wrong” with a person was the shared perception of most of the students in the reviewed research (e.g., Banks, 2017). For example, in a US study focusing upon adolescents’ meanings of disability labels and stigma, Luke explained that disability is “something that means the person is less able” and that “most of the time people wouldn’t say it’s a good quality to have in someone” (Mueller, 2019, p. 276). In another study, Jackson admitted that, “Even though my mother told me that having a disability wasn’t a bad thing, and wasn’t the end of the world, and didn’t mean I was dumb, I still felt a little self-conscious about it” (Banks, 2017, p. 102). Internalizing pejorative assumptions regarding disability and the unquestioned ideology of normalcy as the measure of human worth, it seems rational that some students chose to “not tell” or hide their difference from others, particularly their peers.

In contrast, some students recognized the contextual nature of disability. For instance, Luke claimed that he was not “less able,” providing examples of contexts in which he was academically successful (Mueller, 2019, p. 276). Nathan, who experienced Fetal Alcohol Spectrum Disorder (FASD), rejected health care providers’ assumption that there was “something wrong with him” (Brenna et al., 2017, p. 225). He accepted that the effects of FASD were “real,” and although having this condition was problematic at times, it was also “a source of self-worth” (p. 225).

Inclusive education?

Inclusion to me means that people accept you for who you are. I don’t feel included at school because people see me as “weird,” and so they don’t seem to include me. ... Every person should be included because it’s important to feel a part of something.

Sean, cited in Margrain and Farrugia (2018, p. 100).

Schools act as sorting mechanisms (Slee, 2018), whether through exclusive, segregated/special, or mainstream/integrated educational structures. These forms of education are however ill-defined; in this paper, definitions from UNCRPD Article 24, General Comment No. 4 (United Nations, 2016) are utilized as a means of contextualizing students’ experiences.

UNCRPD is the first international rights mechanism to specify a legally binding right to inclusive education for its signatories. General Comment No. 4 (United Nations, 2016), an update of UNCRPD, defines exclusion from education as a denial of the right to education while segregation/special education is that which is provided separately for disabled students. Integrated/mainstream education involves the placement of “special needs students” and/or those with other marginalized identities into “regular” classes, a process of assimilation into largely ableist schools. Finally, inclusive education necessitates a rights-based transformation of education systems, to remove barriers to all students’ presence, participation, achievement, social relationships and overall well-

being (United Nations, 2016). Of particular relevance to this chapter is the principle that education must value and respect all students' "inherent dignity and autonomy" (United Nations, 2016, p. 3). Does it, however?

Participants in the research that informs this chapter unequivocally indicated that schools are good places for some students; for others, not so much (e.g., Dadvand, 2020). Regardless, schools play a critical role in shaping students' identities and future life possibilities. Across the studies, the majority of students attended mainstream schools, while the others were enrolled in special schools. Comparatively few studies thus far have documented students' experiences of genuinely inclusive schools, perhaps because the process of developing inclusive education is relatively recent and requires fundamental changes in how we "do" education. Students shared thought-provoking observations about the impact of school culture, teachers' beliefs, pedagogical practices and social/relational opportunities on their learning and sense of self-worth.

School cultures

Inclusion "is about the school mentality."

Ro, cited in Goodall (2020, p. 1298).

School culture is apparent in overt and covert ways, from espoused values, leadership priorities, staff attitudes, structures and routines, and an often tacit "this is how we do things here." The culture of a school can often be "felt" and have a significant impact on students. James, an Australian student declared, "I have never liked school ... I don't feel safe here ... I don't feel welcomed here. It's just an alien environment to me" (Dadvand, 2020, p. 1). Similarly, a Greek student remarked, "I felt that I was losing my dignity and self-respect" (Vlachou and Papananou, 2015, p. 80). Why might this be the case? What impact can teachers' thinking about students have on the development of welcoming or inhospitable class and school cultures, in which students may be valued or denigrated?

Teachers' values, beliefs and assumptions

Care about your students. Make sure you like teaching.

Student, cited in Connor and Cavendish (2020, p. 301).

Parker Palmer (2017) asserts that we teach who we are. Who the teacher is in terms of their personal characteristics matters to students. Being empathetic, non-judgmental, making time to listen and being "on my side" (Vlachou and Papananou, 2015, p. 80) were behaviors frequently identified as mattering to students (Vetoniemi and Kärnä, 2019). Such teachers were not found in all schools however. Instead, a sense that some teachers were unwilling to engage with and teach disabled students was evident in numerous ways. Teachers' indifference and assumptions of incompetence were described by many students (Connor and Cavendish, 2020; Margrain and Farrugia, 2018). Philip, whose teacher interacted with every student but him, felt that "you simply don't exist" (Vlachou and Papananou, 2015, p. 80).

Pedagogical practices

I shouldn't be treated any more or any less than any other kids without a learning condition, but I should have the tools that I need to learn in an equal way to other kids without my condition, and at the moment I don't feel I have that.

Dave, cited in Margrain and Farrugia (2018, p. 103).

As noted by Palmer (2017), teachers' personal characteristics, values and beliefs are inseparable from their practices. Some teachers were pedagogically responsive by ensuring that environments, curriculum, teaching strategies, resources and assessments were accessible and meaningful for all students (Vlachou and Papananou, 2015). Engaging student-centered approaches and utilizing Universal Design for Learning (UDL) principles (Connor and Cavendish, 2020) to "reach and teach" all students were practices that students appreciated. Furthermore, focusing on strengths and creating opportunities for students to reveal and develop their competence was critical (Brenna et al., 2017). Making sure students had a "place to shine" (Jessup et al., 2018, p. 96; see also Vetoniemi and Kärnä, 2019) also helped students feel good about themselves.

In mainstream contexts, basic considerations such as the location of classes, seating arrangements and grouping were identified by students as important (Fellner et al., 2017; Vetoniemi and Kärnä, 2019). The use of "ability" grouping, a practice underpinned by "fixed-ability"/determinist assumptions that one is born with a certain amount of (narrowly defined) intelligence, was common. Such practices are increasingly recognized as ineffective and indeed harmful to some students in terms of generating feelings of inadequacy and not being "smart" enough (Andriana and Evans, 2017, p. 182).

According to a student in Banks' (2017, p. 102) research, "there wouldn't be learning disabilities if teachers ha[d] many different ways of teaching." A predominantly teacher-transmission and "one size fits all" approach impeded learning (Connor and

Cavendish, 2020) and social interactions, resulting in what Vetoniemi and Kärnä (2019, p. 6) call “pedagogical segregation.” Failure to cater for those who did not “fit” resulted in students feeling “completely left out” (Vlachou and Papananou, 2015, p. 78).

“Special” education practices

Don’t make it so obvious that they need special help.

Laritza, cited in Fellner et al. (2017, p. 339).

To varying extents, mainstream schools utilized special education practices as a means of “including” disabled students. Students spoke of being labeled, placed in “special ed” programs and having “special ed” teachers and teacher aides. According to Luke, “being in special ed marks you as different. And no one wants to be different” (Mueller, 2019, p. 276). Being pulled out periodically to a resource room led to Javier wondering: “Why am I not in classes with everyone else?” (Mueller, 2019, p. 273). Despite having internalized the wrongness of special, Laritza tried to resist this: “I try my best to change and not be what they mark me, what they label me as. I can prove them wrong” (Fellner et al., 2017, p. 332). The need to prove one’s worth is a heavy and unnecessary burden that many students carry (Markham, 2020).

The complexity and impact of special needs discourses, so adroitly critiqued by Slee in many of his publications (e.g., 2018), is further illustrated by Laritza in her distinction between “special” and “normal” students. She explained, “we usually sit with our own type, you know normal people [gesturing to one side], us [gesturing to the other side]” (Fellner et al., 2017, p. 333). In contrast to such a clear demarcation, the conflation of “special” and inclusive was evident in Andriana and Evans’ (2017) research (e.g., attaching the label of “inclusive/ion” to signs, children/“inclusion child” and teachers [p. 182])—as if by doing so would make it so.

Quite different responses to special education are outlined by Goodall (2020)—because of the failure of some mainstream schools, participants preferred a special school. Its appeal was described in terms of feeling “less lonely because you might feel included as there are others like you” (p. 1299). Interestingly, students in this study felt included in a segregated special school, Wade asserting that inclusion “is more about how a person feels. Feeling valued as a person and feeling you matter” (p. 1298).

Support: helping, hovering or hindering?

It just depends on how children are supported.

Sarah Jane, cited in Goodall (2020, p. 1301).

The kind of support provided to students—and how—matters. Often regarded as “the solution to inclusion,” teacher aides have typically served as the main source of support for disabled students, with varying effects (Rutherford, 2012). As Giangreco et al. claimed in 1997, teacher aides can help, hover and/or hinder. For example, Sean said that a teacher aide “makes me feel like there’s something wrong with me. Like I’m incapable. ... It’s like she stalks me” (Margrain and Farrugia, 2018, p. 101). In contrast, some students appreciated support (e.g., Rutherford, 2012). Secondary school students may encounter an unnecessary academic-social dilemma, in having to choose between teacher aide support for their learning or having relationships with peers, due to the stigma associated with the former (Rutherford, 2012).

Other forms of support may include special education teachers and therapists; how they work with students often determines whether or not “help” lives up to its name or is regarded as a surveillance and regulatory practice (Mueller, 2019). A “sponsor system” involving peers, coaches or mentors was suggested as a way of offering support without shaming students. To minimize notions of neediness, the term “sponsor system” was preferred to “caregiver” (Brenna et al., 2017, p. 224).

Friends matter

I have been excluded from groups of friends a lot. ... They don’t really notice that you’re even there. They just don’t want to see you.

Jasmine, cited in Jessup et al. (2018, p. 97).

Students spoke of a range of social experiences, from being thankful for trusted friends to feeling excluded and invisible (Jessup et al., 2018). The power of friends was immeasurable in terms of its intrinsic value. For example, Nefeli realized that with friends, “you’re no different as a human being, that you’re an equal among equals” (Vlachou and Papananou, 2015, p. 80). Nathan valued his friends for not judging him, and felt safe to share with them his experiences of FASD (Brenna et al., 2017).

Conversely, being bullied and wounded by slurs such as “retard” (Margrain and Farrugia, 2018, p. 100) and “special bastard” (Goodall, 2020, p. 1302) was not uncommon for students (Andriana and Evans, 2017). Ironically, while using a wheelchair made him hyper-visible, a student believed that he was invisible to his peers, asking “why do people look through you and see only a wheelchair? They don’t see me” (Vetoniemi and Kärnä, 2019, p. 8). Focusing primarily on the device that enables a person to operate in a world not built for every-body can elicit feelings of shame as well as frustration.

The essence of students’ experiences

The above discussion reveals often unnoticed or disregarded inequities that have confronted many disabled students. Of fundamental significance are the responses of peers and school staff. These ranged from respect to “not noticing” difference, to indifference, to ignoring/shunning students as if invisible, and/or noticing for the wrong reasons. [Lalvani \(2015, p. 9\)](#) describes the benevolent and ableist response of not noticing someone’s difference as the “goodness of not noticing,” analogous to being “color blind” ([Sapon-Shevin, 2017](#)) to racial difference. Overall, the most important message from students is the desire to simply “be yourself” (Ethan, cited in [Jessup et al., 2018, p. 94](#)). Cara wanted people to “realize I’m there” (p. 93); Jasmine sought to be “noticed, but in a good way” (p. 94); and Emma wished to be accepted “for the way you are” (p. 93). These are not unreasonable desires, but rather fundamental human needs.

Students have generously and honestly shared what it feels like to be on the receiving end of schooling. While recognizing the uniqueness of each person and their circumstances, the overall depiction of disabled students’ education indicates a paucity of equity and an abundance of injustices. The emotional costs of schooling for many students are evident in their raw accounts of rejection and shame, whether explicitly or implicitly at structural and/or personal levels. In the following section, students’ realities are linked to theory in an attempt to understand their experiences.

Theoretical framing of students’ experiences

Discussion of disability theorizing, UNCRC ([United Nations, 1989](#)) and theoretical frameworks of justice is the focus of this part of the chapter. The rationale for drawing from these frameworks is to offer possible understandings of why many students feel alienated within and by schools, and to consider how these theoretical tools might be utilized to bring about “just education” ([Connell, 2012, p. 681](#)) for all students, not just some.

Disability: not a bad thing?

Students’ interpretations of disability reflect the internalization of hegemonic narratives that position disability as an essentialized, pathological flaw within individuals, a marker of difference (read: deviance) and shame, all of which depreciate a person’s human worth ([Dadvand, 2020](#)). In turn, individuals’ assumed inferiority legitimizes the compromising of their right to education.

Theoretically, [Thomas’ \(2004\)](#) social relational model is helpful in conceptualizing the complexity of disability. She recognizes the reality of impairment and its effects—that physical, sensory, cognitive, and emotional differences are real, and do impact on how a person makes their way through life. For example, if someone has cerebral palsy, this is a core part of who they are that cannot/ought not be denied. It should never however diminish a person’s humanity. Thomas also highlights the impact of disabling factors that are external to the individual, referring to these as barriers to doing and barriers to being. The former include anything that limits or denies a person’s participation in any aspects of life (e.g., ableist schools). Barriers to being are psychosocial factors that affect a person’s sense of self, worth, and identity (e.g., the use of derogatory language). These external and interrelated barriers to doing and being are imposed upon a person, exacerbating the effects of their impairment. Thomas’ model exemplifies the socially constructed, contextual and relational nature of disability ([Mueller, 2019](#)), as evident in the accounts of students outlined above.

More recently, the notion of affect, and in particular shame, has featured in Critical Disability Studies literature ([Jóhannsdóttir et al., 2020](#)). As previously mentioned, emotions are not solely individual psychological matters but also need to be understood alongside normative social and cultural power contexts. As claimed by a participant in Jóhannsdóttir et al.’s study, “others, the ones who are not disabled, are better than the disabled ones;” they wanted to be “normal” rather than disabled (p. 11). The role of affect aligns with [Thomas’ \(2004\)](#) barriers to being, and are helpful in making sense of students’ experiences (e.g., asking whether it is ok to have a disability).

Current thinking about disability also positions disabled people as members of a subjugated minority group, akin to other such identity groups founded on commonalities of race, ethnicity, gender diversity and other differences from white, middle-class, “able-bodied” and other hegemonic norms ([Lalvani, 2015](#)). As with such minority groups who experience, for example, racism, many disabled people’s lives and identities are shadowed by ableism, in which “normal” “able-bodied” people are privileged over those who are not ([Banks, 2017](#)). Ableist assumptions are examples of barriers to being and doing, which obstruct students’ opportunities to exercise autonomy regarding their lives, which, as mentioned, is a core principle of UNCPRD and an integral part of UNCRC.

Is having a say sufficient?

“I don’t have a say. [...] I like to make a difference. I’d like to change the way things work” (James, cited in [Dadvand, 2020, p. 10](#)). Article 12 of UNCRC ([United Nations, 1989](#)) mandates the right of all children and young people to have their perspectives accorded due weight in matters that affect them. In her critique of UNCRC Article 12, [Lundy \(2007\)](#) emphasizes the need to contextualize its enactment, making it clear that “Voice” is not enough. To genuinely implement Article 12, Lundy claims that four factors, namely Space, Voice, Audience and Influence (p. 932), must be considered. Space involves all children and young people having opportunities to state their views in nondiscriminatory environments. Voice refers to facilitating the expression of views, in whatever manner works for a child, which importantly recognizes the validity of communication other than verbal. Having someone who

listens and gives due weight to children’s perspectives, however these are conveyed, is the essence of the Audience factor. Influence involves taking children’s views seriously and, wherever possible and appropriate, acting upon them.

With regard to the experiences of students outlined in this chapter, it is evident that recognition of these factors and related UNCRC Articles is sporadic. I suggest that a prerequisite to being afforded space, voice, audience and influence is basic recognition of disabled students in terms of their humanity and capacities—that they are indeed worthy of having a say. If, as numerous students claim, they feel unwelcome, unnoticed and/or diminished by their difference, it is unlikely that any aspects of Lundy’s (2007) model apply. We cannot address what we do not see, recognize or value.

Justice for all or just some?

Recognition in the context of this chapter refers to the fundamental need to be seen, known and validated as a human being. Recognition is a core element of certain theories of justice. Fraser (2008) proposes that three dimensions must be addressed to generate justice and “parity of participation” (p. 405): (1) economic redistribution (redistribution of funding for teacher aides for certain students); (2) cultural recognition (positive recognition and respect for every student); and (3) political representation (students’ involvement in that which concerns them).

As with matters relating to disability and affect, contextual influences determine how each dimension is played out. How teacher aides work with students can influence how they are recognized. The inappropriate use of teacher aides can be a barrier to doing, which also generates a barrier to being in terms of embarrassment/stigma in having such support (Thomas, 2004). Were the provision of human resources managed differently, it is more likely that the other two dimensions could facilitate parity of participation and development of positive identities.

While Fraser’s theorizing is widely utilized by scholars, its minimal recognition of disabled people is ironic yet not uncommon. Pugach et al. (2021) consider disability is often “more of an afterthought” (p. 243) (if thought of at all), and describe the inclusion of disability in discussions of social justice within teacher education research as “a precarious guest at the table” (p. 237). Such theoretical precariousness is mirrored in the real-life experiences of students discussed in this chapter. Being at the table/in class is not however enough. As argued earlier, a prerequisite to having space, a voice, audience and influence (Lundy, 2007) is being recognized as a human being.

Interdependence and respectful relationships are fundamental to effective teaching and learning. Christensen and Dorn (1997) emphasize the primacy of relationships in their proposal of a theory of relational justice. They claim that the “goal of social justice should be a just set of relationships” (p. 193)—that justice is evident (or absent) in the quality of relationships. In a similar vein, Young and Quibell (2000) reason that injustices can only be resolved if people understand each other. This involves recognition of and knowing individuals through relationships as well as constructing their identities in terms of their humanness (Bogdan and Taylor, 1992) and competence (Biklen and Burke, 2006). Conceptualizing justice as a dynamic interpersonal process (“doing right by”) brings to life and makes possible the enactment of formal rights, such as those documented in UNCRC and UNCRPD.

It could be argued that the teachers described by students as indifferent to difference were mis- (or not) educated about disability, rights and justice. The following section offers some suggestions for addressing this concern.

Teacher education: part of the solution to educational inequities (or not)?

So, what should we do about it?

Amelia, cited in Lalvani (2015, p. 12).

The final part of this chapter explores what we can *do* to support students to *be* themselves and to thrive within schools. I have chosen to focus on what can be done within teacher education, on the basis of its responsibility to develop new teachers. That we must do better is identified in UNCRPD Article 24, General Comment No. 4 (2016), in which barriers to inclusive education include:

- (a) lack of understanding of disability as a human rights matter;
- (b) unchallenged discrimination and low educational expectations;
- (c) lack of knowledge regarding the efficacy of inclusive education for all students;
- (e) “lack of political will, technical knowledge, and capacity in implementing the right to inclusive education including *insufficient education of all teaching staff*” [emphasis added] (United Nations, 2016, p. 2).

Specific examples of how teacher education programs do and can address such barriers are first contextualized in terms of the overall purpose of education and the impact of teachers’ assumptions upon educational (in)equities.

What is education for?

At a macro level, how do we conceptualize the overall purpose of education? As Slee has often asked (e.g., 2018), what kind of a world do we want to live in? Scottish educational philosopher John Macmurray (1891–1976) offers wise counsel in his belief

that education is a means of learning to be human, to lead good lives together in community, as "an interdependence of equals" (Macmurray, 1964, p. 21). He claims that "our ability to enter into fully personal relations with others is the measure of our humanity. For inhumanity is precisely the perversion of human relations" (1958, cited in Macmurray, 2012, p. 670).

Macmurray's beliefs align with students' experiences, in which the need to be recognized and respected as a human being in relationship with others is compellingly evident. Slee's (2011) conceptualization of education as an apprenticeship in democracy is also relevant, with its focus on education not only as a right in and of itself, but also as a means of developing rights-bearing citizens. Nevertheless, as documented in this chapter, individuals continue to be disenfranchised and dehumanized within democracies, on the basis of human differences over which they have no control and which are imbued with socially constructed wrongness. I wonder whether (akin to Macmurray's idea that "curriculum and pedagogy should ... be dominated by apprenticeship in humanity through community" (Stern, 2012, p. 740) it would be useful to rethink the purpose of education as an apprenticeship in both democracy *and* humanity.

Do we need to change our minds?

The power that teachers wield, for good or otherwise, is immeasurable and far-reaching. As evident in students' accounts, how teachers think matters. Conceptualizing disability as a natural part of being human is a prerequisite to recognizing and respecting disabled students as human beings who have a right to quality schooling. For some future and current teachers (and teacher educators), coming to such a new way of thinking necessitates a process of "unlearning" deficit assumptions. It is sobering to note Banks' (2017) report that students in her study believed that "teachers' depreciatory beliefs regarding race, gender, and disability were unchangeable" (p. 104).

King (1991) coined the term "dysconsciousness" to describe "an uncritical habit of mind (including perceptions, attitudes, assumptions, and beliefs) that justifies inequity and exploitation by accepting the existing order of things as given" (p. 135). Lalvani and Broderick (2015) have since applied the concept of dysconsciousness to ableism, describing "dysconsciousness ableism" as "the limited understandings that our students may hold about the nature of inequity related to disability/ability" (p. 174). In other words, the teachers described by students as indifferent and disavowing their very presence could be labeled as dysconscious ableists.

Responsibility for developing critical consciousness as an antidote to dysconsciousness lies primarily with teacher educators (Lalvani and Broderick, 2015). Being willing to identify and address our own dysconsciousness through critical reflection about our values, beliefs, assumptions and practices is a first step to teaching future teachers about inequities and their responsibility to respond to them (Broderick and Lalvani, 2017; Lalvani and Broderick, 2015).

Teacher education practices

In my own practice, introducing student teachers to dysconsciousness, critical consciousness, normalcy, ableism, fixed-ability thinking and other core concepts at the start of (and throughout) courses is proving worthwhile. Working through activities in which student teachers are asked to make visible their values and critique their entrenched assumptions is often unsettling work. It requires students to consciously acknowledge tacit knowledge that they have acquired throughout their lives. A common response from student teachers is: "I'd never even thought about this" and/or "I'm noticing things [inequities] in my 'prac' school that I would never have seen before."

Disability Studies in Education (DSE)

Drawing on the framework of Disability Studies in Education (DSE) (Connor and Cavendish, 2020) within teacher education programs is helpful in developing understandings of disability rights. DSE's core tenets include recognizing disability as an inherent aspect of being human; advocating for socially just education for all; presuming every individual is competent; and working with (rather than "on") disabled people—including students (Connor and Cavendish, 2020). In its rejection of "neo-special education" (Slee et al., 2019, p. 5), utilizing a DSE framework can support student teachers to trouble their assumptions about historical and current segregated educational practices, and begin to see "how education might be otherwise" (p. 1).

Disability and intersectionality

The inclusion of disability matters as a compulsory, rather than an elective, minor or "special" component of all teacher education programs is essential to address its longstanding omission from discussion of "minorities" which have been marginalized by dominant cultural power structures (Pugach et al., 2021). It is necessary however to emphasize with student teachers the contextual and intersectional nature of disability. Pugach et al. (2019) call for recognition of the intersectionality of every student's multiple identities. Understanding the concept of intersectionality will also help to disturb and dislodge the false binary of "special" and "normal" and the attendant disparaging discourses that students may experience.

Pedagogies and curriculum

That many teachers do not feel prepared to teach all students is well documented in educational literature (e.g., Black-Hawkins, 2017), however Florian and Linklater (2010) suggest that teachers' apprehension stems from a lack of confidence rather than competence. Within teacher education programs, modeling and teaching the use of inclusive pedagogy (Black-Hawkins, 2017)

and Universal Design for Learning (UDL) (Rose et al., 2014) serve as conceptual and practical tools that contest the assumption that some students are so “special” that they are beyond the expertise and responsibility of “regular” teachers. Rather, these approaches move the focus of learning “difficulties” from the student (= “problem”) to external barriers to learning (e.g., environmental, attitudinal, pedagogical, curricular—barriers to both “doing” and “being”) that teachers have the power to change. Common to these pedagogies is a focus on planning, teaching and assessment with *every-body* in mind from the start. So too is a belief that every child can learn and does so uniquely, providing teachers have created opportunities, choice and the “right” conditions for students to reveal and develop their competence.

In reference to just education, Connell (2012) highlights that, in addition to human rights, “educational responses to deep diversity” (p. 682) are necessary. “Curricular justice” (p. 682) refers to curriculum that is informed by the lives of students who are the least advantaged. The second educational response relates to social encounters within education that are marked by recognition, respect and responsibility. If we consider many of the students’ narratives, even accessing the curriculum, let alone recognizing themselves within it was problematic. Similarly, being seen by teachers and peers is necessary for any social encounter; the dearth of recognition and respectful interactions was all too common and hurtful. Within teacher education then, we need to ensure that student teachers are vigilant and responsive to these elements of just education.

Including strengths-based representation of disability throughout teacher education curricula is one way of bringing it into student teachers’ consciousness (Lalvani, 2015). This can be achieved by routinely incorporating disability-related matters in teaching materials, class activities and readings (wherever possible focusing on students’ experiences of school); utilizing exemplary children’s literature that portrays disability as a natural part of being human and as one aspect of a person’s multiple identities; inviting student teachers to share their experiences; learning from guest speakers who have experience of disability as well as other strategies. Abandoning deficit “special needs-ism” (Rutherford, 2016, p. 127) language is also vital.

Teaching student teachers about human rights is imperative, to ensure that future teachers have the knowledge to model and teach children about their rights and responsibilities as citizens in a democracy. Each year, whenever I ask student teachers to share their knowledge of human rights, there are very few responses. Lalvani (2015) similarly notes student teachers’ lack of knowledge of disability rights. As well, teachers need to recognize and respond appropriately to injustices, their actions grounded in knowledge of relevant international and national rights’ instruments such as UNCRC and UNCRPD. That this is not happening in all schools is evident in a New Zealand study involving beginning secondary school teachers. Three-quarters of participants knew little (or nothing) about UNCRPD; worryingly, 42% believed that such knowledge was *unnecessary* (Attwood et al., 2019, p. 1040).

Practicum matters

Student teachers’ practical experience in schools provides the space in which they can develop their skills in facilitating the social encounters that Connell (2012) claims is an integral educational response to just education. The extent to which such opportunities are available is however somewhat of a lottery. According to Attwood et al. (2019, p. 1043), 70% of their secondary teacher participants had minimal or no engagement with disabled students in their practice. While acknowledging logistical constraints such as the availability of schools and exemplary teachers, this is an area for urgent action. If some students in any class are not “seen,” let alone interacted with, disabled students will continue to feel the emotional impact of being “the last to come to mind” (Fellner et al., 2017, p. 331).

As evident in the accounts of students who were on the receiving end of teacher aides, knowledge of the latter’s role must also be part of teacher education programs. In my own practice, as part of an assignment, student teachers are required to have a conversation with a teacher aide in their school practicum. This is then synthesized with relevant research to develop guidelines for working collaboratively with support staff, for the good of all students. It is encouraging to witness student teachers’ growth in understanding and shift in (dysconscious) assumptions, from “the special needs students are looked after by the teacher aide,” to acting to address inequity, “when I’m teaching, I want to include the student with the teacher aide—it’s not fair that they’re left out.”

These are but some aspects of teacher education that need to be critiqued if we are to foster the growth of teachers who “want to get to know you as a person and you feel you have a place [in school]” (Jo, cited in Goodall, 2020, p. 1298). Providing opportunities for student teachers to feel uncertain about what they have come to know, and to offer alternative ways of knowing that are grounded in students’ experiences of schooling, may move us closer to fairer futures for the latter.

End of chapter thoughts

Documenting the affective impact of schooling on disabled students’ development has been the intent of this chapter. While it is heartening to read of a student’s feeling that “you’re no different as a human being, that you’re an equal among equals” (Vlachou and Papananou, 2015, p. 80), it is extremely disheartening to know that the reality reads so differently for many students, that “you are different from human beings; you’re not equal to others.” Current disability and justice theorizing underscores positive recognition, representation and respect, founded on positive relationships with disabled people, to realize just education. Fracturing the socially constructed dependence (special)—independence (normal) binary through recognition of our interdependence, as equals in relationships, is also crucial (Macmurray, 1964, 2012). As discussed, teacher educators play a critical role in facilitating (or obstructing) transformative change.

Students have afforded us insight to their school worlds. Are these the kinds of worlds we want, both within and beyond education? Is having a disability “the end of the world” (Banks, 2017, p. 102)? Do we want to live in a world in which some individuals

feel that they do not belong with "normal people" who have "nothing wrong with them" (Fellner et al., 2017, p. 335), and feel safer staying with "our own type ... our own people" (p. 333)? Or, as a child in Lalvani's (2015) study declared, "I want to live in a world where all people are treated equally" (p. 12), in which, as her peer claimed, "It is okay to have a disability" (p. 14).

The need for recognition of students' humanity has been writ large throughout the chapter, validating Macmurray's (2012) conceptualization of education as a means of learning to be human. In light of the inhumanity shown to many students by their peers and teachers, I reiterate my belief that education is an apprenticeship in humanity and democracy. As Sean stated (Margrain and Farrugia, 2018, p. 107),

I would make sure that every child gets treated fairly, regardless of their disability. I would not let any teacher make them feel as if they were less than a human being.

Postscript: What about Bill? Despite the shame he felt, he survived school and moved into a world in which he found a place where he could be himself—and thrive.

In this chapter I explore the broad idea of “Belonging,” a concept put forth by scholars within the field of Disability Studies in Education (DSE). First, I examine the relationship of inclusive education to the ideal of creating a space in which all students feel a sense of belonging, arguing its value as a centering principle for practice. Second, I share a sample of other areas within DSE that have generated interest and engagement as the field continues to grow. The list is comprised of diverse topics, largely the subject of my own interests as I observe and participate in cultivating the growth of DSE: (1) the need to continue *cripping* the curriculum; (2) the increased popularity of disability-related memoirs; (3) the rise of the Neurodiversity movement; (4) countering the race-evasiveness of within the field of special education; (5) the development of interdisciplinary theories such as Disability Critical Race Theory (DisCrit); (6) the shift to Critical Disability Studies (CDSs); and, (7) the globalization of CDS. Finally, I discuss ways in which these topics overlap as they relate to the broad notion of belonging writ large, and in particular, within classrooms.

Of policies, placements, and dispositions

While the formalization of inclusive education for children with disabilities has now existed for decades (Lipsky and Gartner, 1997), and has seen many successful incarnations (Danforth, 2014; Hehir and Katzman, 2012), degrees of conceptual confusion have continued to exist. These are, in part, due to purposeful resistance by many scholars in the field of special education who continue to advocate for “appropriate” exclusive settings (Kauffman and Hallahan, 2004). The promise of inclusive education in comparison to its fulfillment to date has left some advocates for inclusive practices disappointed, perplexed, and questioning why we cannot do better in providing a quality education for all students (Slee, 2011; Smith, 2009)?

“*This is Not the Right Setting*” is a phrase I have heard throughout my career in education. It is primarily spoken by teachers (self-identifying as special or general educators), administrators, or school psychologists, and is usually the first step in excluding a child identified as disabled from a particular classroom or school. The comment is followed by a version of “His needs will be better met in a smaller setting”, or “She’ll receive more attention with a lower student to teacher ratio”. I am not naïve enough to think this may be true for some children, but I believe that such arrangements would be preferable short term rather than permanent. However, what is striking is the ease by which children with disabilities can be moved around. Put differently, the changing of classroom settings can be interpreted as a widespread form of passing the buck, namely shifting children who do not fit in a particular environment. What has contributed to changing a student’s placement easily is the wide range of options available. These placement options are usually correlated with the level of services provided, meaning the more intense the services, the more restrictive the setting. How did the special education system in the USA get that way?

Let us take a few steps back. Historically, widespread policies of local educational authorities had always excluded a number of children with disabilities, usually claiming a lack of resources and trained professionals (Fleischer and Zames, 2011). In response to such policies, parents of excluded children with disabilities organized to file class action lawsuits. As a result of their efforts, the landmark legislation of the Education of All Handicapped Children Act of 1975 (EAHCA) was passed to ensure all children with disabilities received the right to a “free and appropriate public education”. However, for many students with disabilities, getting in the door did not equate to getting classrooms with nondisabled peers. In fact, the majority of disabled students were placed in separate locations, creating a dual, segregated system in the USA and other countries (Tomlinson, 1985). As the number

of disability labels grew, so did the types of placement settings, thereby reifying the field of special education as a separate entity from general education (Skrtic, 1991).

For some educators, these organizational structures and cultural practices were ethically problematic and legally questionable, impinging upon the civil rights of students with disabilities (Lipsky and Gartner, 1997). Hence, by the late 1980s, the nascent movement of inclusive education, the idea of students with disabilities being educated alongside their peers had emerged, with encouragement and support from the federal government (Will, 1986). While some educators recognized the intent of inclusive education as creating equity among students (Villa and Thousand, 1995), others resisted the movement, suspiciously viewing it as a cost-saving federal mandate that would ultimately dilute provisions made for students with disabilities (Kauffman and Hallahan, 1995).

Now established as an autonomous discipline, complete with professional organizations, research funding, separate teacher preparation programs undergirded by its distinct ideology, the field of special education undermined the notion of inclusive education and attacked the educators who supported it (Brantlinger, 1997). It is precisely because many leaders in the field of special education not only opposed the inclusion movement (Fuchs and Fuchs, 1994) and sought to silence scholars who dissented from them (Gallagher et al., 2003) that the field of DSE was formed by critical special educators (for a more detailed description of how this occurred, see Connor 2014). From the beginning, part of DSE's mission has always been to support "full and meaningful access to all aspects of society for disabled people" (Connor et al., 2008, p. 448), with a particular focus on all educational settings. Having provided a brief context of policies, placements, and dispositions regarding students with disabilities, in the following section, I explore the relationship between inclusive education and belonging.

A sense of belonging

Despite resistance toward it, the inclusion movement gathered strength during the decades that followed, increasing numbers of children with disabilities were being educated in general education classrooms. With inclusion gaining traction and increasing momentum, the field of special education continued to reassert its investment in retaining segregated settings (Kauffman et al., 2002). Simultaneously, special education reluctantly accepted that inclusive education for more students with disabilities was here to stay. However, to this day, in seeking to retain power and influence, the field of special education continues attempting to colonize inclusive education, even to subsume it within its parameters. This phenomenon can be symbolically seen in many textbooks utilized in teacher education programs that have shifted from titles pertaining only to special education to those such as *Assessment in Special and Inclusive Education* (Salvia et al., 2020). Similarly, the contributions of Marilyn Friend, noted for her work in developing models of collaborative teaching in inclusive classrooms, appear eclipsed by a recent publication titled *Special Education: Contemporary Perspectives for School Professionals (What's New in Special Education)* (2018). Special education's attempted colonization has also occurred in the development, implementation, and research of the federal policy Response to Intervention (RTI), designed to provide support for academically struggling students (Fuchs and Fuchs, 2006). Consequently, general educators, arguably the most important professionals in regard to inclusion, think that inclusion is really the business of the special educators, as special educators (Danforth and Connor, 2020). However, the growth of DSE has helped to provide an alternative narrative about inclusive education that directly challenges ableist beliefs and practices, affirming disability as a natural phenomenon, and providing teachers with ways to create and continue developing inclusive practices, while critiquing ongoing exclusionary ones (Baglieri, 2017; Danforth, 2014; Dudley-Marling and Gurn, 2010; Slee, 2011; Smith, 2009; Valle and Connor, 2019).

In addition to the problematics of how inclusive education has come to be defined and marketed in various ways, other questionable assumptions about what it is continue to exist. For example, some educational organizations view inclusion as primarily a technical or programmatic endeavor, measured in the percentage of time a student spends in their school day in classes with non-disabled peers (National Assessment of Educational Progress, 2010). This approach reduces inclusion to a mathematical formula, dehumanizing both the concept and the experience. For other professionals, there remains the stubborn notion that using modifications and accommodations for students with disabilities is unfair to non-disabled peers (Wiebe Berry, 2008). In other words, traditional "one size" fits all approaches to pedagogy, often employed in Standards-based, exam driven classrooms, are incompatible with inclusive practices. Of course, Universal Design for Learning (UDL) with its premise of creating classrooms to be physically and pedagogically accessible (Novak, 2016), and differentiated instruction, the concept of being flexible in teaching the content, engaging in the process of learning, and developing different products (Tomlinson, 2014), provide valuable ways to address the challenges and complexities of teaching inclusively.

Another problematic area when contemplating how best to prepare inclusive teachers is the continued separation of professionals entering the field of teaching when provided with a forced choice of becoming certified as either a general or special educator. Unfortunately, the content of general education programs does not sufficiently prepare graduates for working with students with disabilities (Forlin and Chambers, 2011), students who are emergent bilinguals (Durgunoglu and Hughes, 2010), or both (Cioè-Peña, 2017). In brief, even though there is a generalized sense among educators as to why inclusive education exists, there are structural, attitudinal, and systemic challenges as to what inclusive education actually is and people's responsibility toward it (Connor, 2012).

Into the mix of contemplating what authentic inclusion is, or can be, is the concept of belonging. My first encounter with its use in relation to inclusive practices was in the form of Arthur Shapiro's book *Everybody Belongs* (2000). Its subtitle, *Changing Negative Attitudes Toward Classmates with Disabilities*, is clearly aimed at educating students without disabilities. For the second edition, the

author teamed with a DSE scholar, giving the title a makeover: *Disability Studies in the Inclusive Classroom*, along with a new subtitle, *Critical Practices for Creating Least Restrictive Attitudes* (Baglieri and Shapiro, 2012). The third version maintains the main title, but the subtitle morphs again to *Critical Practices for Embracing Diversity in Education* (Baglieri, 2017). I trace this trajectory as it evidences how DSE locates the notion of belonging as integral to its core values. While Disability Studies is foregrounded as a means to understand inclusive education, and “belonging” is not explicitly stated in the second and third iterations, the change in wording shifts the focus of power onto the teacher. In brief, educators are asked to understand disability as a natural form of human diversity, with the implicit message of “everybody belongs” remaining intact.

More recently, the topic of Belonging was foregrounded in a special edition of the *International Journal of Inclusive Education*, with a lead article titled, *Belonging in an Age of Exclusion* (Slee, 2019). The author confesses,

Perhaps it is naïve, but I had accepted “belonging” as a conceptual and practical precondition or element of community and inclusion. Ergo, I had assumed that inclusive education embraced a commitment to dismantling exclusions that formed the foundations for the oppression of vulnerable individuals and population cohorts. (p. 910).

In brief, he notes the lack of active commitment by the educational establishment (and beyond) to imagine and create inclusive environments. By all accounts, the revolutionary possibilities of inclusion to disrupt and change the educational ecosystem have been systematically and, at times, severely resisted (Hulgin and Drake, 2010). Efforts to thwart the success of inclusive education have occurred on many levels, some of them already articulated: from within both fields of special education and general education (their continued separation problematic in itself) to sluggish, bureaucratic local educational authorities; from unimaginative teacher preparation programs to the continued justification of exclusionary placements; from the pervasive pathologization of differences in humans to the sifting and sorting of people prepared for more and less valued professions—and by extension—positions in society. All of these issues create cause for concern, captured in a book title by the same first author, *Inclusion Isn't Dead, it Just Smells Funny* (Slee and Tomlinson, 2018). In a nutshell, the current state of inclusion is definitely perceived as “off.”

Even so, as inclusion is an ideal, it can only be approximated if never fully achieved. Knowing and accepting this reality has kept DSE-oriented educators motivated in the pursuit to make our society, starting with its classrooms, inclusive of all people. Bearing this point in mind, let us return to the idea of belonging as “a conceptual and practical precondition or element of community and inclusion” (Slee, 2019, p. 910). In many ways, the concept of belonging can be seen as an anchor—perhaps the anchor—to moor all educators. There are many associations with the word “belonging” in the context of inclusion. For example, in addition to disability (Connor and Berman, 2019), a sense of belonging can be related to racial identity (Hunter et al., 2019), ethnicity (Gonzalez, 2019), language(s) (DeNicolo, 2019), sexual orientation (Hatchel et al., 2018), gender (Lewis et al., 2017) and other markers of identity. Each of these groups have a history of being excluded in various ways from a full public education, with many individuals standing at the interstices of multiply marginalized identities (see, for example, Annamma, 2017; Ferri and Connor, 2009; Ramirez, 2007). In addition, each of these groups has described experiences of microaggressions with teachers, administrators, and other students to remind them of their status, being different from “the norm” (Dudley-Marling and Gurn, 2010). Likewise, they have experienced educational systems, structures, and practices in which they were made to feel uncomfortable, unwelcome, inadequate, and disconnected, questioning if they belonged in schools. A larger question raised is: *To what degree do students drop out or are they pushed out by the very system charged to educate them?* (McNeil et al., 2008).

One of the main reasons why some students feel they do not belong in inclusive classrooms or schools in general is a disconnection between the environment and themselves, prompting feelings of not-fitting in, anxiety, and disenfranchisement (DeMatthews, 2020). These observations speak directly to the purpose of schooling, its historical task of preparing children and youth to participate in, and contribute to, society. On one hand, schools are supposed to help students find their “place” in the world and yet, on the other hand, they have always been tied to forms of social reproduction, stratified along class lines (Collins, 2009) while being porous enough to allow social mobility for some that keeps the American Dream alive (Hochschild and Scovronik, 2003). However, globalization has shifted traditional job opportunities and employment patterns, creating national anxieties about a nation’s standing in relation to others (Tomlinson, 2013). According to the World Population Review, the USA is currently 26th in rankings based upon reading, math, and science scores (2021). Such a lackluster position that has been constant for decades has triggered an intense focus on raising academic levels measured by test scores. This trend can be seen in the form of a Standards Based movement that has dominated Pre-K through 12th grade curricula for decades. Some argue that the Standards zeitgeist is cautiously compatible to inclusive education (Ainscow et al., 2006). Others have argued that new “norms” create new undesirable students, unwelcome in classrooms (Orsati and Causton-Theoharis, 2013). What becomes evident is that a sole or obsessive focus on academic achievement at the expense of all else actively neglects other equally important realms of development—the social and emotional. If we weave all realms together—academic, social, and emotional—and envision classrooms that nurture all students, supporting their growth as human beings rather than mere performers of academic tasks that determine their value in society, then we have a grounding that is simpatico with inclusive education and a sense of belonging.

Unfortunately, the over-emphasis on international competition as the driver of academic agendas is a global phenomenon. For example, Berryman and Bley (2019) invited educators in New Zealand to consider “... what can happen when we focus only on excellence and students reaching their potential, without simultaneously investing in their sense of belonging and wellbeing,” (p. 985) because, “National statistics suggest we are alienating and shortchanging an increasing number of students and, for

disproportionate numbers of indigenous students, these statistics are part of a world trend" (p. 985). The authors note that approximately 1 in 5 students in New Zealand feel "like an outsider," "left out of things," "awkward and out of place," or "lonely" (p. 986). They recognize these descriptions are antithetical to feeling like they belong, where "... people feel accepted, respected, included and supported by a community in which they are involved" (Watson, 2005, p. 988). What has been observed in New Zealand—and around the world—is that the holistic wellbeing of children is suffering when their academic performance is of primary value, the only being counted. Schools have always had the capacity to be dehumanizing places emphasizing perceived deficits in children (Connor, 2009). One purpose of DSE, therefore, is a more humanizing view of human differences, needs, supports, and successes—striving to create classroom spaces in which everybody belongs and ableist attitudes can be actively dismantled through education (Baglieri and Lavani, 2019).

Contemplating belonging, cultivating disability studies in education

While a sense of belonging is both explicitly and implicitly integral to how educators with a DSE disposition envision and create classrooms, I now turn to DSE to share some of its other concerns. Admittedly, these areas have been selected as I find them personally interesting. Indeed, ask another scholar, and they would likely generate a different list, although I would predict significant overlap. Respecting diversity of thinking and a plurality of interests is one of the personally and professionally satisfying things about working in DSE. For the last two decades it has been an expanding field that continues to grow in many directions. I focus on seven areas: (1) the ongoing *cripping* of the curriculum; (2) the popularity of the disability-related memoir; (3) the neurodiversity movement; (4) negation of racial disparities by the field of special education; (5) the emergence of *DisCrit* and other intersectional analyses; (6) differences between DS and Critical Disability Studies (CDSs); and, (7) the globalization of CDS. In the following sections, I touch upon each area, with a caveat that all of them deserve more space and time for deeper exploration.

The ongoing crippling of curriculum with DSE

Crippling the curriculum has always been a priority of DSE (Connor and Bejoian, 2006, 2007) and continues to be so (Baglieri, 2017; Baglieri and Lavani, 2019). DSE scholars believe it is crucial that teachers first recognize the dominant discourse about disability that circulates throughout education, or what Swartz (1992) calls The Master Script. "Master scripting," he explains, "silences multiple voices and perspectives, primarily by legitimizing dominant, White, upper-class, male voicings as the 'standard' knowledge students need to know" (p. 341). Other scripts—including those of inclusive education—are deliberately omitted, or reshaped within the master script for assimilationist purposes. In fact, the more contrary the other script, the greater likelihood of its exclusion or radical morphing, thereby ensuring a continuation of the dominant discourse. Scholars working within DSE and focusing on social models of disability historically experienced being subjected to master scripting by major journals in the field of special education (Gallagher et al., 2003) who still only value medicalized understandings of disability (Anastasiou et al., 2017).

An integral part of DSE is to help teachers recognize and rewrite the master script. Examples of ways this can be done in practice is through the premise of Universal Design for Learning (UDL), that is, creating accessible classrooms for everyone as the starting point (Wilson, 2017), and utilizing differentiated instruction to support all students in learning content, how they process information, and the evidence of learning they produce (Tomlinson, 2001). However, more than the planning and implementation of lessons, it is vital that teachers pro-actively develop ways to teach disability as diversity. Banks' (1993) original outline of the five dimensions of multicultural education are also apt when applied to disability: (1) diversity must be integrated into the content, rather than adopting an additive approach; (2) the origins and construction of knowledge is made transparent, including how various ways of thinking have influenced scholars; (3) a pro-active approach is used to reduce prejudice and helps cultivate positive attitudes to different groups; (4) equitable pedagogy is used that encourages diverse forms of social interactions; and (5) an empowering school culture is consciously developed. These dimensions serve as a guide to transformative approaches of teaching and learning about disability, including integrating the knowledge contributions disabled people.

In regard to pre-school and elementary school, the work of Lavani and Bacon (2018) urge us to rethink the clichéd notion of "We are all special" by engaging in teaching anti-ableism curricula in early childhood classrooms. They advocate for the following four goals, providing multiple examples: (1) each child will demonstrate self-awareness, confidence, family pride, and positive social identities (e.g., "learn key phrases of a song in a different language, including sign language, p. 6); (2) each child will experience comfort and joy with human diversity, have accurate language for human differences, and form deep caring human connections (e.g., "use Sesame Street's new character, Julia, to teach about sensory differences and autism" (p. 9); (3) each child will increasingly recognize unfairness, have language to describe unfairness, and understand that unfairness hurts (e.g., "invite a guest speaker to share their experiences of hurt/unfairness related to a disability" p. 10), and (4) each child will demonstrate empowerment and the skills to act, with others or alone, against prejudice and/or discriminatory actions (e.g., "generate ideas for creating an inclusive playground, gym, or art room" (p. 12). In brief, Bacon and Lavani (2019) seek to challenge dominant master narratives and elevate subjugated knowledges to ensure "the righting of the story of disability in K-12 curricula" (p. 387).

Whether in middle school or high school, students learn about the Civil Rights Movements. Teachers must ask themselves: What groups are included or excluded—African-Americans? Women? The LGBTQI community? People with disabilities? Each group has organized at the grass roots level and forged onward despite considerable social and cultural opposition, to gain political power that ensures greater access to various rights and protections in terms of employment and, for people with disabilities—education, health

care, transportation, and community integration. When focusing on the Disability Rights Movement (a phenomenon that is often unrecognized and rarely included), emphasis can be placed on the activists who organized demonstrations, staged sit-ins, and argued vociferously to speak for themselves and finally be heard. From an activist's perspective, being able to *get on* a public bus was the first symbolic move (Fleischer and Zames, 2011). Students can evaluate the ways that the disability rights movement is similar to, and different from, other important movements, in addition to describing the breadth and limitations of each.

In high school, teachers can assist students to actively analyze most classic texts, from *Of Mice and Men* (Steinbeck, 1937) to *Richard III* (Shakespeare, 2018), *To Kill a Mockingbird* (Lee, 1961) to *A Streetcar Named Desire* (Williams, 1947) to critique and debate the portrayals of characters with disabilities. Likewise, depictions of disability modern classics such as *Girl, Interrupted* (Kaysen, 1994) and *One Flew Over the Cuckoo's Nest* (Kessey, 1964), along with genres such as Southern Gothic and Horror, can be unpacked. (For readers interested in this area we recommend the *Journal of Literary and Cultural Disability Studies* whose sole focus is on depictions of disability in literature). During adolescent years, students' awareness of the complex nature of the world increases, as they create connections among multiple sources of information. They are able to understand the idea of disability as a minority status, and it can be explored with other markers of identity such as race, gender, ethnicity, and sexual orientation. Students can also contemplate: when people with disabilities claim kinship as a minority group, how might that change their self-perception, and how non-disabled people view them? Students can also explore some of the inequalities faced by people with disabilities that, until pointed out to the majority group, usually go "unseen" and therefore unacknowledged.

The popularity of memoir

Memoirs have become ubiquitous in our times, and many disability-related publications in this genre have enjoyed critical acclaim. Most authors being located in the sub-genre of "nobody memoirs," that is, written by non-famous people. As memoir expert Couser (2012) writes, "A good many nobody memoirs are accounts of what it's like to live in, or as, some *particular body*" (p. 20). He explains,

... that has often meant writing about odd bodies, those with anomalous somatic conditions of some sort—illnesses or disabilities. A few conditions—breast cancer, paralysis, HIV/AIDS, deafness, and autism—have produced very large bodies of literature. Numerous other conditions—some seemingly obscure or rare (Munchausen syndrome by proxy)—have been represented in small numbers of narratives. In the case of some conditions (like autism, Down syndrome, and Alzheimer's Disease), the production of personal memoir was hitherto thought to be impossible (p. 20).

In many ways, Couser claims that we live in a Golden Age of disability memoirs that allow us to come close to the perceptions and lived experiences of disabled people. Interestingly, while family members of people with disabilities have also produced more memoirs than in previous times, Couser claims that "... depictions of particular disabilities may affect all those with such a condition. This is why memoirs of disability that are not written by people with the condition in question are especially likely to do harm" (p. 106). This point, I believe, is worth considering when applied to research. It brings up similar issues when depictions of disability are generated by non-disabled people who are removed from the daily lives of disabled people, the impact that those deficit-based understandings have historically had (Harry and Klingner, 2007), and institutional resistance toward conducting research with people *with* disabilities (Barton, 2005).

In contrast to information shared in traditional disability-related research, disability-knowledge attained through engaging with memoirs reveal intensively detailed ways that are rare in research findings. The phenomenon of an identified subgenre of disability memoirs shared by a wide variety of people holds interest for the general public from facial anomalies (Grealy, 2003) to cerebral palsy (Claire, 2017), to mobility impairments (Callahan, 1990) to Deaf-blindness (Girma, 2019), to Asperger's syndrome (Page, 2009) to Learning Disabilities (Mooney, 2019). Many of us working in DSE select information in memoirs to help shape lectures and presentations, require certain memoirs in course syllabi, and provide the option of elective readings and projects. In this way, the actual lived experience of an individual can reveal the complexities of negotiating the physical and social world—including classrooms and education systems in vivid ways that research articles and standard textbooks cannot. As memoirs are deeply personal, they almost invariably resonate with the reader in ways that impact their thinking about important concepts such as what it means to belonging to various communities (including among family, school, peers), the emotional impact of being different from the norm, and ways in which the world is configured to either enable or disable people. Put differently, integrating the humanities into teacher education classes provides a counter-balance to the pervasive deficit-based portrayals of disability.

The neurodiversity movement

Since the 1990s, the term "neurodiversity," coined by Australian sociologist with autism Judy Singer gained traction among people labeled neurologically disabled who preferred to view themselves as a part of natural human diversity. In an *Atlantic* magazine interview with Singer by Harvey Blume (1998), he noted:

Neurodiversity may be every bit as crucial for the human race as biodiversity is for life in general. Who can say what form of wiring will prove best at any given moment? Cybernetics and computer culture, for example, may favor a somewhat autistic cast of mind.

In particular, the label has appealed to individuals identified as having Asperger's Syndrome such as Ari Ne'eman, Co-Founder and President of the Autism Self Advocacy Network and the first autistic presidential appointee on the National Council for Disability. Most importantly, individuals with autism who identify as neurodiverse have challenged well-established professional organizations such as the Child Study Center at New York University who published threatening, ableist portrayals of autism in advertisements designed to look like ransom notes—all with the purpose of raising funds for scientific research and did not have any autistic people in positions of decision-making (Savarese and Savarese, 2010).

Other people identified as having Learning Disabilities (LD) and Attention Deficit Hyperactivity Disorder (ADHD) have also self-identified as part of the neurodiversity movement (Mooney, 2008, 2019), co-creating educational organizations such as Project Eye to Eye (Flink, 2014) in which mentorship occurs between successful professionals with LD/ADHD and children and youth in schools across the country. The acceptance of neurodiversity has occurred more so in mainstream journals than in traditional special education publications, that see such grass-roots reframing as threatening to their beliefs. For example, in his article in *Educational Leadership*, Armstrong (2017) critiques the outdated concepts and inward-looking practices of special education, charging it has "too often remained insular, holding fast to its diagnostic categories" (p. 14), and is stuck in "a disability mindset" (p. 15), while neglecting "strengths based-learning, inclusion, and other positive innovations" (p. 15). Similarly, DS scholars have engaged about neurodiversity in mainstream education publications to show how it contributes to dislodging usually unacknowledged ableist assumptions that reinforce superior notions of "normates" (Lewieki-Wilson et al., 2008).

In addition to individuals with autism, LD, and ADHD, the neurodiversity label has been claimed by people with intellectual disabilities, mental illness, and forms of autism other than Aspergers, who have experienced exclusion even from disability advocacy groups (Hughes, n.d.). Scholars within Mad Studies also recognize "shared concerns" with the neurodiversity community as they seek to make space within the academy (McWade et al., 2014), and the commonalities with neurodiversity and disability in general because, "These movements must all struggle to undermine what they perceive to be as stereotyped representations in science and medicine as well as in popular culture" (Rowland, 2015, p. 2). It is clear that a groundswell of grass roots activism has explored new framings of disability, forged new connections, and have gained ground in various venues from popular magazine articles to academic journals, memoirs to white papers.

The negation of racial disparities by the field of special education

The overrepresentation of students of color in special education has been a pervasive problem since the landmark case *Brown v. Board of Education*, when schools were ordered to become racially integrated in the USA (Ferri and Connor, 2005). Resource centers at Harvard and New York University were established to study and monitor this problem, and to develop approaches to reduce numbers to more equal proportions. Critical special educators published widely in this area, focusing on a variety of angles, including: an "across the board" look at all factors contributing to overrepresentation and how these factors interlock with a view to creating innovative ways that prevent such situations (Losen and Orfield, 2002); recognizing research as a form of cultural practice connected to the issues (Arzubiaga et al., 2008); situating research within historical accounts of exclusion, segregation, and inequity (Artiles, 2009); valuing interdisciplinary methods that complicate our understanding of disproportionality along with new units of analysis such as the "geographies of opportunity" maps created by Artiles et al. (2011); promoting an intersectional approach to understand the lived experiences of students who have been traditionally segregated within school (Erevelles and Minear, 2010) and within the school-to-prison nexus, an insidious phenomenon in which schooling practices resemble those of carceral facilities into which many Black and Brown students are expected to transition as a foregone conclusion (Annamma, 2017); and naming the day-to-day referral process for assessment in school of a potential disability (notice, referral, assessment, diagnosis, placement) as "The molding of (in)competence with ephemeral tainted categories" that erases considerations of race and social, cultural, and linguistic differences among students (Artiles, 2017).

However, over the last few years, the field of special education has embraced the findings of a small group of researchers who claimed the opposite of the historical recognition of overrepresentation, namely that more students of color should be identified as having disabilities, receiving unprecedented publicity in the media (Morgan et al., 2015). Critical special education scholars responded to challenge the many shortcomings of Morgan and colleagues, including a special edition of *Multiple Voices*, a special education journal dedicated to issues of students of color with disabilities, including a DSE perspective (Collins et al., 2016). Meanwhile, Morgan and colleagues continue with their research, "replicating" findings (2017), even though their work flies in the face of half a century of research stating otherwise. Unfortunately, research was used by then Education Secretary Betsey DeVos to suspend federal funding dedicated to research on overrepresentation (Youdin, 2018). DSE scholars and critical special educators continue to challenge the race evasiveness of the field of special education (Connor et al., 2019) because, given what we know about disabilities not being a monolithic experience, and the complicating aspects of race and class on labeling, placement, and disciplinary outcomes, advocating for the increased identification of students of color with disabilities is highly problematic.

The emergence of *DisCrit* and other intersectional approaches

Intersectional approaches to understanding disability have emerged, offering more nuanced understandings of how various markers of identity impact the life experiences of individuals. For example, scholars valued the use of Disability Studies yet recognized it was not sufficiently engaged with issues of race, similarly noting the value of Critical Race Theory, while recognizing it had not integrated disability. To better understand life at the intersections of dis/ability and race, Annamma, Connor, and Ferri synthesized both

theoretical frameworks to create Disability Critical Race Theory (*DisCrit*) (2013). As a dynamic framework that simultaneously engages about disability and race, the seven tenets of *DisCrit* are grounded in the assumption that racism and ableism are mutually constituted and collusive—perpetually circulating across time and context in interconnected ways to uphold normalcy. For example, scholars have utilized *DisCrit* to look at: race, class, and ability (Gillborn et al., 2016); the achievement/opportunity gap (King Thorius and Tan, 2016); overrepresentation (Fergus, 2016); the school-to-prison pipeline (Adams and Erevelles, 2016); school reform (Tomlinson, 2016); and “youth out of place” (Collins, 2016, p. 183).

Interest in using this nascent theoretical framework has grown rapidly and exponentially (Annamma et al., 2018) with scholars crossing disciplinary boundaries and geographic borders (Migliarini, 2017); explicitly questioning the connections between racism and ableism (Artiles, in press); critiquing Positive Behavioral Intervention and Supports (PBISs) (Adams, 2015); teacher education for white teachers (Beneke, 2017) and teachers of color (Kulkarni, 2015); and centering the voices of disabled scholars of color (Hernández-Saca, 2017). Scholars interested in/exclusionary practices have also developed new frameworks to hone theorizing and analysis in their specific areas. For example, Cioè-Peña, 2017 brings together central tenets of *DisCrit* with key components of a raciolinguistic perspective by proposing a Critical Disabilities Raciolinguistic (CDR) perspective to address the particular needs of linguistically-minoritized students of color with disabilities and to counter the White normative gaze. Similarly, Padia and Traxler (2021) use *UndocuCrit* to explore the experiences of students at the intersection of disability and migratory status. In one particular study, for example, they examine “the interplay of fear, schooling, and language use as students pursue college” p. 687.

DisCrit has also been taken up by scholars who see the utility of its framework both for looking inwardly and developing potential actions to ameliorate inequalities within the USA, and others who consider its potential use in the Global South. In an interesting turn, Morgan (2022) argues for *DisCrit* to be applied to American law, bringing the elements of Critical Race Theory back to their original roots within Legislation. She justifies her argument by calling attention to “... the ongoing discrimination, marginalization, and violence against disabled people of color, and the inability of existing federal disability laws, policies, and practices to fully protect against these harms, or adequately remedy these harms.” In terms of the Global South, Sarkar et al. (2022) consider *DisCrit* in its application to India and other countries outside of the Western realm of knowledge development, who continue to struggle in providing education—inclusive or otherwise—to their population of students with disabilities. The authors note the importance of culturally relevant inclusive education as “a theoretical foundation that appreciates culturally held values and local knowledge, while addressing intersecting forms of exclusion and inequity in the Indian context” (p. 82). These examples are two of many in ways *DisCrit* disrupts and ruptures existing fields of study (Annamma et al., 2021), contributing to intersectional and interdisciplinary fields, and claiming its place at the table of social justice issues.

Differentiating DSE and critical disability studies

Over the couple of decades, for many scholars interested in disability, disability studies has evolved into critical disability studies. Meekosha and Shuttleworth (2009) explored whether this change in nomenclature “constitutes a radical paradigm shift, or simply signifies a maturing of the discipline” (p. 47). The authors note how disability studies emerged as part of the civil rights movements and was primarily a critique of society’s response to disability and the material consequences for disabled citizens. While they are mindful of a widespread diversification of social theory and the possibilities that brings, they also urge the field to maintain some of DS’s founding principles, including “(1) the irreducibility of social life to objective facts; (2) the requirement of linking theory with praxis in the struggle for an autonomous and participatory society; (3) the necessity that a discipline or field of study be aware of its own historicity and critically reflect on its conceptual framework; and (4) the need to engage in a dialogue with other cultures on the issues and concepts of current significance” (p. 47).

In his attempts to dis/entangle CDS, Goodley (2013) sees the potential possibilities and risks in this transdisciplinary space, offering insights into “theorizing through materialism, bodies that matter, inter/trans-section-ality, global disability studies, and self and Other” (p. 631). His premise of potential possibilities and risks rests upon the desire to engage with other transformative theoretical arenas such as queer, feminist, and critical race theory, and how CDS reminds us of “the centrality of disability when we consider the politics of life itself” (p. 631) and the search for revolutionary responses. And yet, there is a decided tension in the air. For some, the growth of theoretical possibilities within a transdisciplinary approach to disability have been liberating; for others, it signals a move away from the grass roots grounding concerns of material existence of disabled people in a capitalist society (Barnes, 2012). However, there are, as Goodley notes, ways to balance theoretical expansion with practical concerns, of combining activism and theory that impacts practice. Practical contexts include professions designed to support people with disabilities that have ironically fostered oppressive beliefs and practices. Therefore, a CDS approach to the education of teachers (Connor, in review), social workers (Meekosha and Dowse, 2007), rehabilitation (Magasi, 2008) becomes possible, as it provides the framework to show practices that enable or disable, allowing professionals to enter their fields with a critical eye and a disposition that rejects deficit-understandings of humans, with a view to be part of changes to be made around the world.

Globalization of critical disability studies

Of great interest has been the rise of international critical disability studies in what has been termed “The Global South,” namely nations that have historically been underacknowledged in Western theory and research. Wealthier “Western” nations such as the USA, UK, Australia, and New Zealand have long dominated the field of DS. This phenomenon is problematic for many reasons, including the relevance of DS around the world and how disabilities are perceived and understood within all cultures. The vestiges

of colonialism include a hierarchy of countries defined by wealth, with commonplace terms that reflect standing and self-inscribed importance among nations, such as “first world” and “third world,” “developed” and “developing.” Complicating relationships among countries is the notion of exporting concepts of disability from one global zone to another, raising questions about neo-colonial influences and universal assumptions about disability.

Several DSE and/or CDS scholars have written of the global politics of disability, particularly with global initiatives, asserting education for all being a human right, still very much a challenge for countries with limited resources (Gabel and Danforth, 2008). In particular, Erevelles (2011) has developed insightful critiques of the historical production of disability as it intersects with race, social class, caste, gender, sexual orientation, and citizenship within a neoliberal capital landscape. Along with analyses of the social processes that designate which bodies matter and which do not, Erevelles also articulates hope for more socially just arrangements through using “a materialist ethic of care” (p. 175).

In another example of scholars contemplating the North-South divide, Meekosha (2008) questions the ontological, epistemological, and theoretical assertions within Northern Hemisphere DS, disputing:

claims to universality (what happens in the Global North should happen in the south); a reading from the metropole (a methodological projection of ideas from the centre into the periphery); emphasis on the importance of northern feudal/capitalist modes of production (with an accompanying ignorance and grand erasure of indigenous/ traditional modes of living of the south); a colonialism of psychic, cultural and geographical life of the south by the north; and ignorance of the resistant-subaltern positions of “Global Southerners”

Cited in Goodley, 2013, p. 638.

A recurring theme in writings by CDS scholars who navigate multiple worlds, such as immigrants from South Asia and South America who now reside in the USA is how much ideas fermented in Northern societies are applicable to the Global South in countries wherein the largest percentage of children with disabilities are medical-based conditions, such as disease (Sarkar et al., 2022), cultural ideas of disability differ significantly (Figueroa and Hernández-Saca, 2021), and specific, local issues take precedent. At the same time, scholars such as Rao and Kalyanpur (2015) have used an interdisciplinary perspective to carefully explore disability studies and South Asia, featuring parallel topics to the Global North such as identity construction, historical understandings of disability, cultural representations, and language around disability. More recently, Elder and Migliarini (2020) have focused on decolonizing inclusive education via CDS and *DisCrit* informed practices “show how critical theoretical frameworks can be made accessible to practitioners through strategies that can foster a critical perspective of inclusive education in postcolonial countries” (p. 1852). In doing so, they seek to “push back against the uncritical transfer of inclusion models into Southern countries, which further puts pressure on practitioners to imitate the Northern values of access, acceptance, participation, and academic achievement” (Werning et al., 2006). These examples illustrate ways in which the globalization of CDS has developed as an interactive, productive site of thought and inquiry, that encourage ongoing dialogue.

Conclusion

This chapter is dedicated to the concept of belonging and other areas of interest within DSE. I began by exploring the concept of belonging in relation to inclusive education, recognizing how it is integral to a DSE disposition. I then identified seven areas of interest as examples of topics directly related to DSE. Although these areas can be viewed as disparate, there are connections and overlaps among them, including the broad theme of belonging—writ large. To illustrate some of the connections, I briefly consider the areas of theory, practice, research, and policy.

In terms of theory, Critical Disability Studies supports engagement with any other fields that can potentially offer more nuanced insights into how disability is understood and experienced, and yet it must, as Goodley (2013) notes, strive to balance its growing theoretical confidence with praxis. Similarly, interest in Disability Critical Race Theory has developed in many directions, but the purpose of theory is to determine actions, and scholars are mindful of ways in which a *DisCrit* disposition can be employed from everyday practices to policy reform. Likewise, activists and scholars who identify as neurodiverse have claimed their place by self-theorizing and mobilizing to be in decision-making positions within organizations. If we consider what belonging means in the realm of theory, it is the presence of a distinct theory that is also welcome and utilized within interdisciplinary, social-justice centered work.

In terms of research, we see how a DSE disposition has provided a consistent alternative to limited and medicalized notions of disability, selecting from “political, social, cultural, historical, and individual understandings of disability” (Connor et al., 2008, p. 448). By uniting with critical special educators interested in the cultural contexts within which disability arises, DSE has forged coalitions that continue to challenge dominant paradigms of thought, and seek to redefine how research on disability is conceived of and executed at every step, diversifying research in ways that are culturally relevant, centering people with disabilities as participants and collaborators, rather than subjects (Gonzalez et al., 2017). These issues raise questions about the type of research (and researchers) that inform policy reforms and curriculum choices.

In terms of policy, engagement between the Global North and Global South in both directions has highlighted the importance of considering local customs, beliefs, and practices if a change in policy and practice is to be developed and enacted. Also, the identification of patterns across countries is useful in studying international trends, with the promise of looking at familiar problems

such as overrepresentation of minoritized, indigenous, and immigrant children and youth with a different lens (Cooc and Kiru, 2018). Additionally, the idea of centering student wellbeing within educational policies and practices, as Berryman and Bley (2019) note, is key to acknowledging the importance of a sense of belonging.

In terms of practice, DSE continues to emphasize the moral and ethical dimensions of inclusive education, acknowledging legal and technical aspects must always be negotiated, but without taking precedent. By utilizing DSE in teacher education programs, pre-service and in-service teachers develop an understanding as to why and how to develop and maintain inclusive practices in both the Global North and South. These practices include an ongoing *cripping* of the curriculum to ensure a presence of disability to be discussed and debated, for there is much to both learn and unlearn.

Finally, classrooms are microcosms of society, including its values. As educators, we should aim for creating environments where students feel a sense of belonging, and recognize that their classmates belong. That way, we can stop saying, "This is Not the Right Setting."

Introduction

SHE is in her late teens, but can't read or write. This is because she cannot find a school for children with special needs like her.

"She" is Mathabo Mosanteli and her story is told in a South African newspaper (Macupe, 2015). It is a simplistic story in which individual deficit (illiteracy) is attributed to inadequate special school provision. The focus is Mathabo's "special needs" and the report justifiably draws attention to the hundreds of thousands of disabled children and young people who are out of school in that country (Human Rights Watch, 2015). It rehearses many of the tropes of similar news reports, including that disabled students are deficient, pitiable and helpless, that separate special schools are assumed as the appropriate placement for them, and that the government is not doing its job (Walton and McKenzie, 2020). But the simplicity of the story is pernicious. It is a single-factor analysis which fails to recognize the complexities of disability and its intersections with other identities. Mathabo's problem, according to the story, is that she has a learning disability. But she is also a young woman in a country with very high rates of gender-based violence, particularly against disabled women (Chirwa et al., 2020; Graaff and Heineken, 2017). She is a Black African, living with the legacies of racial segregation and oppression under previous colonial and apartheid governments. She is poor in a country of extreme income inequality, which will negatively affect her access to health and other social services (Sulla and Zikhali, 2018). Her experience is certainly shaped by systemic disablism that results in inadequate appropriate schooling. But it is compounded by sexism, racism and unequal economic power. Without recognizing these factors, the story fails to capture the nuances of educational exclusion in the South African context.

The unequal power relations wrought by ableism and disablism are necessary, but often insufficient explanations for the exclusion that occurs in and through education. A failure to acknowledge the intersectional impact of other oppressed identities in analysis, policy and practice risks reproducing inequality. The concept of intersectionality furthers an understanding of the complex interplay of people's identities, lives and experiences in particular contexts and can be harnessed in the quest for educational justice. This article explores intersectionality with reference to disability studies in education in three moves. First, I define intersectionality as a conceptual and analytical resource and show what it reveals about the imbrications of disability and race, class/socio-economic status, gender and migrant/refugee status. I then return to Mathabo's context and offer a case-study of South Africa that illustrates the interlocking workings of power in the education system. The third move acknowledges that intersectionality is a traveling theory which can be depoliticized (Davis, 2020). This section proposes considerations to ensure that intersectionality retains its critical and emancipatory contribution to disability studies in education. The article concludes with the promise of intersectionality as a necessary condition for the realization of socially just, inclusive and democratic education.

Intersectionality

Intersectionality is a conceptual and analytical resource that furthers an understanding of the unequal social relations that produce the educational exclusion of disabled children and young people. It recognizes their intersecting identities and the complex ways in which their experiences are shaped by the interstices of power that give rise to multiple axes of oppression. The term "intersectionality" was coined by Kimberlé Crenshaw (Crenshaw, 1991). She sought to describe the compounding disadvantage experienced by people living with multiple oppressed identities and the potential for social movements organized around a particular identity (like

feminism) to ignore the additional effects of other marginalized identities (like race or class). Often spoken of as a theory, intersectionality can be regarded as “a method and a disposition, a heuristic and analytic tool” and it is continually being developed (Carbado et al., 2013, p. 303). Romero (2018) uses a Rubik cube metaphor to describe intersectionality. The rotating cube visualizes the “multiple layers of domination and the intersection of systems of oppression” (ibid. p. 11). She sees that intersectionality allows an analysis of social identities in terms of “power, privilege and opportunity structures” (ibid.). Tikly (2020, p. 37) recognizes “intersecting regimes of inequality” including class, race, ethnicity and gender that co-evolve and are mutually constituting. Importantly, intersectionality is not the recognition of the co-existence of identity markers, but a consideration of “how each supports or unsettles the constitution of one another” (Goodley, 2013, p. 636).

Disability is often absent when scholars focus on intersectional inequality (see, for example, Tikly (2020) and Fruja Amthor (2017)). While not all intersectional scholars consider disability, disability studies (in education) acknowledges intersectionality as an important concern (Slee et al., 2019; Broderick et al., 2006). Ferri (2006, p. 304) offers the challenge and the possibilities of intersectionality in disability studies in education, saying that it requires us:

To give up certainties but in the process we gain complexity, we give up having easy answers but get better at asking hard questions, we ask for trouble in the classroom and in our own thinking but in so doing we end up with a pedagogical model that is both more than and different from any sum of identity-based parts.

This article attests to the complexity inherent in intersectional thinking and analysis, and the lack of easy answers.

A framework for discerning injustice

Ableism and disablism work together with other axes of oppression in complex ways to produce unequal social relations. These in turn set up a series of educational arrangements that differentially benefit students and produce exclusion. In the section that follows, I present four conceptual case studies on the intersections of disability with race, class/socio-economic status, gender, and refugee/migrant status. These illustrate “the relations and processes that create inequality or oppression” (Frobisher et al., 2019, p. 414). These relations and processes are located in the school and classroom and beyond, and must be seen in the context of wider societal inequities, including housing, employment, and access to health services (Harry, 2014). Students, as Artiles (2004, p. 552) notes, are “suspended in a web of historical, ideological, and cultural forces”. Their own cultures, histories and geographies are in play, as are the complex ways in which political, economic and educational structures advantage and disadvantage them and their families.

Disability and race

The overrepresentation of minority groups in segregated special settings has long been recognized in education where ethnic minority and marginalized groups have been placed in special education in numbers disproportionate to their presence in the student population as a whole (Harry, 2014; Woods et al., 2020). In the USA, racial and ethnic disparities in special education placements have led to amendments to the Individuals with Disabilities in Education Act (Woods et al., 2020). Other countries, including the UK, Germany, and Sweden also have concerns about disproportionality and low educational achievement of minority ethnic groups (Harry, 2014; Tomlinson, 2017). Accounting for this disproportionality requires considerations at the confluence of systemic and institutional discrimination, racism and bias, the instability of disability categorization, and configurations of educational provision.

Differential assignment of disability categories and labels reflects both racial biases and the instability of some categories, especially those relying on clinical judgment. Racial biases may be found in the presumption of white middle-classness as the “norm” against which behaviors and achievements are measured (O’Connor and Fernandez, 2006). The history of the category “Learning Disabilities” as a preferred diagnostic category for white middle-class students has been well documented by Reid and Valle (2004). Harry (2014) extends this discussion by noting the disproportionate incidence of white students assigned to the preferred “Severe Learning Disabilities (SLD)” category, and of black students in the stigmatized Intellectual Disability category. White students may be more likely to have an ADHD diagnosis in the USA, with teachers believing that white children who misbehave must be “sick” whereas black children who misbehave are merely “naughty” (Tait, 2010, p. 22). In the category of Emotional Disturbance, Harry (2014, p. 84) notes that “professional judgments will vary according to personal tolerance of non-compliance” with cultural conditioning playing a role in interpreting behaviors. The same behaviors may be evaluated as normal for white students, but as deviant when displayed by black students (O’Connor and Fernandez, 2006).

The way education provision is configured in different contexts impacts measures of disproportionality. This includes structures (e.g., general classrooms, self-contained classrooms, special schools), quality of provision, and resources (what supports get funded and how). In turn, these interact with systems of high stakes testing and accountability regimes, where schools are pitted against each other in competitive league tables. Poor quality instruction must be a consideration in understanding disproportionality, with Harry (2014) citing research that shows that students living in poverty, and those who are English language learners receive inferior schooling in the USA. Then, the key point is when “low achievement comes to be interpreted as ‘disability’” with teacher referrals for evaluation leading to special education placement (ibid. p. 75). Across the world, measures are taken by schools to

minimize the impact of low scorers on tests, including securing mitigating “special educational needs” labels or other exclusionary measures (Tomlinson, 2017; Riddle, 2018; Slee, 2018).

The scholarship on disproportionality tends to focus on countries of the Global North, with a consideration of ethnic and racial minority students relative to the majority white population. The Global South is often marginalized or ignored (Grech, 2015). Disproportionality is evident in the global incidence of disability and outcomes for disabled students. UNESCO (2018a, p. 4) notes that, “Around four in five children with disabilities are in developing countries. At all ages, levels of both moderate and severe disability are higher in low- and middle-income countries than in rich countries”. The legacies of racist colonialism and underdevelopment have to be acknowledged in the manufacture of this state of affairs. The violence of colonialism has contributed to disability incidence in the Global South and the “management” of disability through colonial institutions has caused untold suffering (Grech, 2015; Walton and McKenzie, 2020). Nor can this be assumed to be an unfortunate but closed chapter in human history. The (white) West cannot avert its eyes from its complicity in ongoing economic exploitation, war, political manipulation and epistemicide, all of which are implicated in the racialized experience and incidence of disability in the Global South. These themes recur in the sections below, as they must, in an acknowledgment of intersectionality and complexity.

Disability and class/socio-economic status

Race and class/socio-economic status influence how disability is experienced (Ferri, 2006). The focus in this section is specifically on the intersection of disability and class/socio-economic status, recognizing that race and class/socio-economic status themselves intersect in mutually constitutive ways in different countries. I use the term class/socio-economic status deliberately, but with caution, recognizing that they are interwoven, but not synonymous.

Poverty and disability are closely linked (Singal et al., 2019; UNESCO, 2018a). Inadequate healthcare, especially maternity and early years care, poor diet, unsanitary living conditions and dangerous work are all associated with poverty and cause impairments. In turn, being disabled is a predictor of being poor, due to inadequate social support funding, various barriers to education and employment and the costs of healthcare, support workers, transport and assistive devices. The compounding experience of poverty and disability is acknowledged as life-long and intergenerational, but has particular resonance in education. Having a poor parent with a disability increases the likelihood that a child will not attend school in some countries. Disabled children tend to leave school early in poor countries, or do not attend school at all (UNESCO, 2018a). But living in a richer country is no guarantee that disabled students will flourish. The policy of austerity and spending cuts in education in the UK has had a “crippling” impact on support available for disabled children, with Ryan (2019, p. 180) noting that “children with the highest levels of need are paying the biggest price”. The price is paid in loss of transport, therapies and one-to-one assistance that enables inclusion in mainstream schools. The result, notes Ryan, has been the increase in enrollment in special schools, contrary to the aims of inclusive education.

Disability diagnosis has a complex relationship with class/socio-economic status and, in turn, is linked to incentives around resourcing. A child with low socio-economic status is more likely to be diagnosed with a behavior disorder in countries like the USA, UK and Australia (Harwood, 2006). Harwood and Allan (2016) note that in Australia, rates of medication for young people diagnosed with ADHD are highest in disadvantaged communities. In that country, taking medication can be a condition of enrollment, and the imbalance of power between school and parents from disadvantaged communities makes resistance difficult (Harwood, 2006). These power imbalances may also make it more difficult for parents of working-class backgrounds to advocate for their disabled children to ensure they get the support and resources to which they are entitled. In some contexts, though, it is richer parents who can mobilize their economic and cultural capital to have their children diagnosed to benefit from available resources. Tomlinson (2017, p. 129) says that there is evidence in England that middle class parents fear the consequences of their children not performing well at school and would prefer “to claim that their children have medical, neurological or therapeutic conditions”. Race and class thus intersect with disability in complex ways, always to the benefit of the powerful. Unequal gender relations also impact disabled people.

Disability and gender

Gendered biases in diagnosis, particularly in neuropsychiatric conditions, is common. Globally, boys make up more than 50% of students classified as having “special educational needs” and needing additional support (Riddell, 2014, p. 104). Boys are more likely than girls to be diagnosed with ADHD (Harwood and Allan, 2016) and Autism (Dukekot et al., 2017). Higher referral rates may explain these diagnostic imbalances, with referral based on the identification of behavior that is defined as disordered. Harwood and Allan (2016, p. 160) say, “It is difficult to ignore how dangerous it is to be a boy, or at least a certain type of boy, in the era of psychopathologization”. While boys may have the edge on the “bad”, girls and women have historically been “sad” and “mad”. The pathologization of women’s bodies and experiences by a patriarchal and sexist medical world has been well documented by feminist disability scholars (Thomas, 1999; Goodley, 2017). These scholars point to the conflated devaluation of the bodies of women and disabled people, construed as weak, dependent and deficient, always in need of rescue and support (Garland-Thomson, 2010).

The Global Education Monitoring Report on Gender Equality (UNESCO, 2020) celebrates the “dramatic improvements” in girls’ access to, and achievement in education. However, it recognizes that it is girls who are intersectionally disadvantaged by poverty or disability who “face the worst forms of acute exclusion in the world’s poorest countries” (ibid. p. viii). Mozambique is offered as an example where 49% of disabled men can read and write, in contrast to only 17% of disabled women (ibid. p. 1). The report highlights infrastructural barriers to education such as inaccessibility of single-sex sanitation facilities for disabled girls and women in some countries. It also draws attention to the problem of policies that focus on a single excluded identity (like gender) but fail to

appreciate the particular exclusion produced by the intersection of other identities (like disability). An approach to policy that “analyses interlocking institutional formations of power” (ibid. p. 6) is recommended by the Report and signals a welcome recognition of the importance of intersectionality in responding to educational exclusion.

Disability studies in education needs to keep attention on the interstices of disablism and sexism, but also consider related oppressions of homophobia and transphobia. Duke’s (2011) comprehensive meta-synthesis of research shows the discrimination and prejudice that disabled LGBT students experience in many contexts because of their intersecting devalued identities, the inadequate sex- and sexuality education that they receive, especially in special education settings, and homosexuality portrayed as “a forbidden topic” (ibid. p. 37). The synthesis also notes that female participants are underrepresented in research with disabled LGBT young people. The recognition of queer/trans* disabled identity intersections has been acknowledged in some higher education spaces (Miller et al., 2019), where the fraught issue of identity disclosure points to the pervasive impact of a hetero- and cis-normative, ableist education system.

Disability and migrant/refugee status

Limited, yet growing attention is being given to the compounded marginalization and exclusion from education experienced by disabled refugee and migrant students (Walton et al., 2020). Much of this research comes from Global North contexts at the point where recent migrants and refugees confront established systems of special education support. Concerns are mostly framed in terms of the identification and assessment of learning disabilities and difficulties. Language barriers may lead to migrant or refugee children being referred for assessments of cognitive ability and then performing poorly on these assessments, leading to disproportionate over-representation in special education settings (Bačáková and Closs, 2013; Kaplan et al., 2016; Nicolai et al., 2016). This in turn has negative consequences for the social integration that education offers recent arrivals (Crock et al., 2017). The effects of trauma on learning and behavior are not always easily disentangled from other disabilities, which further complicates assessment and support provision (Graham et al., 2016; Sirin and Rogers-Sirin, 2015). A different line of inquiry has been pursued in Austria where Bešić et al. (2020) found disability, refugee status and gender intersecting in the public’s attitude to inclusive education.

Research in the Global North and the Global South (Hurley et al., 2014; King et al., 2010; Ryan et al., 2010; Tadesse, 2014) shows under-reporting of disability by immigrant or refugee families. The reasons for this are complex and relate to insecure status, fear of further disadvantage, and different cultural conceptions of disability and educational support. Global South countries report lower rates of enrollment for disabled refugee students as a result of factors that include inadequate teacher training, lack of teaching aids and assistive devices, inflexible curricula and inaccessible buildings (Crock et al., 2017; Reilly, 2010). Refugee education and disability education are separated in policy provision and reported separately in monitoring, with minimal evidence that either considers the impact of the compounding experience of being both a refugee and a disabled person (Walton et al., 2020).

These examples show the complexity of the lived experience of disability and the differential impact of compounding vulnerabilities. This impact is well illustrated by the vagaries of disability (or “special needs”) diagnosis, incidence, and response, as these pivot on a range of other personal and environmental factors. They also show the importance of a situated analysis and the need for a recognition of the exigencies of context. The section below returns to South Africa to show how the complex interaction of relations of oppression produce educational and social inequality.

An intersectional case-study: South African education

South Africa’s system of legalized racial discrimination and segregation meant that white people benefitted from the political and economic power they exercised prior to, and through the apartheid state. In the deliberate manufacture of social and economic inequality, the apartheid government (in power from 1948 to 1994) spent five to six times more on white children than they did on Black African children (Taylor et al., 2013). As a result of education policies, Black African children were educated in under-resourced schools, many teachers were unqualified or underqualified, and curriculum options were limited. Higher student to teacher ratios existed in schools for Black Africans. Whereas most white students completed school during apartheid, many Black African students dropped out even before high school and their rate of university enrollment was much lower than that of their white counterparts. Gender inequality is evident, though, and in 1976 girls were more likely to leave school early (Christie, 1985, p. 111). White children also benefitted from a well-resourced, but separate special education system, which was based on a strong individual/medical deficit model. Separate schools were available for children with different categories of disability and specialized knowledge for special education was promoted (Engelbrecht, 2006). This was a country that privileged the white, male, able child at the expense of all others in the education system, and in his life beyond school. Very little provision was made for disabled Black African students, and by 2001 it was estimated that over 280,000 children and young people were out of school, mostly because of inadequate provision for disabled students (Department of Education (DoE), 2001).

The post-apartheid government of 1994 inherited a highly fragmented and deeply unequal education system, and immediately went to work to realize constitutional values of the right to education for all and freedom from discrimination. After a consultative process, White Paper Six was promulgated in 2001 (DoE, 2001) and offered a framework for building an inclusive education system. One of its earliest breaks with the past was to adopt the term “barriers to learning” in an attempt to capture the intersecting impact of socio-economic background and impairment. Around the time of the end of legalized apartheid, scholars like Donald (1994) had tried to shift the emphasis on “special need” which was assumed to apply to only a small percentage of school-going children. He proposed an acknowledgment of “deficits” caused by “intrinsic” factors (usually medical or organic in origin)

and also of deficits caused by “extrinsic” factors in the systems and structures of schools and society. This idea was taken up by White Paper Six which acknowledges that “different learning needs” arise from a number of factors, including impairments and “socio-economic deprivation” (DoE, 2001, p. 5). It has been carried forward into the country’s Policy on Screening, Identification, Assessment and Support (SIAS) (Department of Basic Education (DBE), 2014) which claims, as a principle that

Support should no longer focus only on the diagnosis and remediation of deficits in individual learners through individual attention by specialist staff. The SIAS shifts the focus to a holistic approach where a whole range of possible barriers to learning that a learner may experience (such as extrinsic barriers in the home, school or community environment, or barriers related to disabilities) are considered. The aim is to design support programmes in such a way that the learner gains access to learning.

However, this vision of a “holistic” approach does not always translate into improved educational access and success as economic capacity constrains what schools and the wider education system can resource (Engelbrecht, 2020).

The legacy of apartheid is bitter, longstanding and difficult to overturn. At the broadest level, Fleisch (2007) characterizes the post-apartheid education system as “bimodal” with two *de facto* “systems”. The first is generally well-functioning, made up mainly of former white and Indian schools, and independent schools, which together produce most of the country’s university entrants. This is very different from the second system, mostly serving poor learners from deprived communities, and which offers a “restricted set of knowledge and skills” (ibid. 2007, p. 2) compared with what is offered in the first system. Studies show that 58% of pupils are unable to read for meaning in any language by the end of Grade 4 (10 year olds), and 29% are completely illiterate (van der Berg et al., 2016, p. 16). White pupils are more likely to complete high school (Grade 12) and girls are less likely to repeat years and drop out (Taylor et al., 2013). The Department of Basic Education (DBE) (2015) admits that, “Currently, there are persistent challenges that retard the progress that is being made in the development of an Inclusive Education and Training System” (p. 6). Twenty five years after the end of legalized apartheid, disability remains the reason given most often for children and young people not attending school (DBE, 2019).

As might be expected from global trends, disabled people in South Africa spend fewer years in formal education than do non-disabled people, and disabled women have the lowest educational levels, reflecting the intersectional impact of misogyny and disablism (Moodley and Graham, 2015). But, because of apartheid’s legacy, race has the biggest impact on levels of educational attainment in South Africa, destabilizing the “poverty-disability nexus” (ibid. p. 28). Disabled white women still complete more years in education than non-disabled Black men, reflecting the differential privilege that whiteness affords (ibid.). The Committee on the Rights of Persons with Disabilities (United Nations, 2018) in its observations on South Africa’s country report noted a number of concerns regarding the ongoing intersectional disadvantage of disabled people. These particularly concern disabled girls and women who experience discrimination in accessing education, employment and health care. Black disabled women in particular experience compounded marginalization in their exclusion from involvement in decisions on matters that directly concern them. Concern is also noted about the gender-based violence, exploitation and abuse experienced by disabled girls and women, including instances in schools and school hostels. The committee recommends that South Africa should, “Adopt effective legislation and policies that will explicitly provide protection against multiple and intersectional forms of discrimination” (ibid. Section 9b).

As South Africa pursues inclusive education with a focus on a range of possible intersecting “barriers to learning”, the disabled community has raised concerns about the marginalization of disability in inclusive education discourses (Walton and Rusznyak, 2019) and the devaluation of specialist knowledge (McKenzie et al., 2020). Countering this, various disability organizations and parent advocacy groups campaign to advance the right to education. They draw on a vibrant tradition of activism in South Africa that traces its origins to early resistance movements against the colonial and apartheid states. With some exceptions, these organizations tend to be group specific, often focusing on advocacy around a particular disability or impairment (like Down Syndrome South Africa and QuadPara Association of South Africa). Their voices are heard in policy consultations and they use various civil and legal mechanisms to hold the government to account for the failure to realize the right to education for all (McKenzie et al., 2017). They have combined their efforts in submitting reports to the Committee on the Rights of Persons with Disabilities, with the *The Right to Education for Children with Disabilities Alliance’s* (2016) Alternative Report offering a scathing indictment of the South African government’s failure to implement inclusive education for disabled children.

The postapartheid state faces very real challenges in implementing inclusive education and the many “solutions” proposed by high-income, Global North countries fail to address the regimes of inequality that work together to produce educational exclusion in this context. The content-rich curriculum that has been introduced to address overall levels of low educational attainment has been found to be too fast paced and rigid to enable access and success by many disabled students (Andrews et al., 2019). Special schools are no longer racially segregated, but they charge fees and are mostly located in former white, urban areas, meaning either additional transport costs or hostel living (Human Rights Watch, 2015). The compounding experience of poverty and a disabling society is overwhelmingly experienced by Black African disabled students and their families, especially those living in rural areas. Mention must also be made of xenophobia and the invisibilisation of disabled refugee students and their families (Walton et al., 2020) and the endemic heteronormativity of the South African education system (Francis and Reygan, 2016). The lived experience of disability in South Africa is inevitably one of intersectional identities, shaped by historical and current systems and structures. Deepening an understanding of this intersectionality is important in this country’s pursuit of inclusive education, as it is elsewhere.

Leveraging intersectionality: necessary concepts

Intersectionality, like other powerful social theories, has the potential to be sanitized, tamed and domesticated, as it travels (Salem, 2018) from Crenshaw's original conceptualization. The term intersectionality in the institutionalized discourses of equality, diversity and inclusion easily becomes shorthand for "think about other identities too". The term is sometimes recruited to convey an additive approach that acknowledges multiple identities without interrogating the complexities at the confluence of these identities (Rice et al., 2019). Or, intersectionality gets an obligatory, but "cursory nod before moving on" (Annamma et al., 2016, p. 12). Core concepts of intersectionality are described in depth by Collins and Bilge (2020), Romero (2018) and others. Rather than repeating these, I suggest how intersectionality is potentially diminished, misrepresented or caricatured without certain ideas. My thinking is influenced by Janks's (2010) synthesis model which explains the effect of the absence of different aspects of critical literacy and Maton's (2014) idea of rarefaction, where a concept is stripped of meaning. In the section that follows, I will offer eight prerequisite propositions for advancing intersectionality, summarized in Table 1.

Intersectionality must reckon with the workings of *power and oppression*. Unequal power dynamics are at work "establishing normative orders, creating centers and margins, bringing about systems of privilege and disadvantage" (Steyn, 2015, p. 381). Not recognizing this leads to a focus on different identities and their possible intersections, without distinguishing which differences are unmarked or unremarkable, and which differences make a difference. Without acknowledging power, intersectionality becomes merely a celebration of differences in a fantasy land of diversity with assumed equality (Bhabha, 1994). Evident in bright and multi-colored depictions of "diversity" in images and logos of inclusive education, this approach creates the idea that people are all equally different (Walton and Dixon, 2020). The danger of intersectionality thus diminished is that disabled children get added to schools and their difference "celebrated" in what Erevelles (2005, p. 66) calls the "add-and-stir policy". "Empathy" and "understanding" of individual (even intersecting) identities (the "exotic other") are sought while ableism, racism and other axes of oppression remain invisible (Reygan et al., 2018).

Intersectionality must take *historicity* into account. This means recognizing historical forces that have co-constructed race, gender, disability and other identities. Intersectional oppression is not a modern phenomenon and ignoring the past risks misreading the present. In a historical void educational disadvantage or difficulty experienced by groups is seen as an aberration, a transient phenomenon, or as an individual problem that has to be remediated through individual response. The response is a superficial "what works" approach, designed to ameliorate negative circumstances or experiences, rather than to challenge their historical antecedents in structural oppression. The system is too easily cast as neutral, if not benign, and "non-achievement" is attributed to deficits associated with one or more of an individual's constituent identities. This prevents collective action against educational injustice (McCall and Skrtic, 2009) as each individual family is cast as an anomaly in the face of a smooth-running system that appears to work for the rest.

Intersectionality requires a *theory of knowers and knowledge* (cf Maton, 2014). It demands consideration of who knows what about whom and how they come by this knowledge, and what counts as legitimate knowledge about people's lives and experiences. There's long been a call for disabled people to be recognized as experts in their own lives, and for parents' knowledge of their disabled children to be legitimated (Van Hove et al., 2008). The hegemony of (Anglo-Western) professionals whose assumed expertise about the lives of others has been questioned (Titchkosky and Aubrecht, 2015), and the impetus to diagnose, categorize and treat has led to ever increasing niche areas of therapeutic and pedagogical knowledge. Veck (2014, p. 784) asks,

What, then, might be said when the education of children with certain identified impairments is conceived as a specialist activity, to be conducted by specialist practitioners, and when the authority of these professionals derives neither from their knowledge of, nor from the responsibility they have taken for, the world, but rather from their specialist expertise?

Attempts to essentialize, that is, to understand and respond to someone in terms of a diagnostic or stereotyped category, are defied by an acknowledgment of intersectionality. Individual identities are forged at the nexus of privileging and disprivileging

Table 1 Eight prerequisite propositions for advancing intersectionality.

<i>Prerequisites for advancing intersectionality</i>	<i>Without which, intersectionality ...</i>
Reckoning with power and oppression	Becomes a fantasy-land of diversity with assumed equality.
Historicity	Risks exceptionalism as disadvantage is viewed as a temporary aberration.
A theory of knowledge and knowers	Risks essentializing people according to their characteristics and individualizing their problems.
Geography, culture and context	Risks universalism by not recognizing that regimes of inequality work differently in different locations.
Justice	Risks abstraction and loses its emancipatory impact on people's lived experience of oppression.
Relationality	Risks silos and suspicion as intersectional allyship becomes impossible, resulting in polarization and competition.
Embodiment	Risks symbolism and the creation of disembodied hierarchies of inequality.
Agency	Risks determinism and saviourism, and the erasure of self and community advocacy.

or disadvantaging structures. These individuals need to be accorded the “testimonial justice” that Fricker (2007) describes, that is, credibility untainted by prejudice and stereotype. However, in the political quest to dismantle educational exclusion, we need to be cautious about proliferating the specialist knower (Walton, 2016) around what Slee (2011, p. 64) calls “constituent interests”. The neo-liberal education regime thrives on the narrative of the individual, and exclusion is easily justified as being a benign response in the interest of the individual (Silver, 1994). Research, in an effort to produce knowledge about “unique” experiences and learning needs, works to fragment the student population, focusing on difference, and producing the researchable Other. In so doing, the “problem” of the individual disabled child becomes the starting point of research and the focus of inclusion (Slee, 2011, p. 82). A more productive approach seems to be that taken by the General Education Monitoring Report which says “mechanisms of exclusion are common regardless of group” (UNESCO, 2018b, p. 4). Knowledge of these common mechanisms of exclusion should command our attention and offer a way forward to advance intersectional interests in education.

Intersectionality has to recognize ways in which the peculiarities and exigencies of *geography, culture and context* interact with individual identities to differentially privilege and disprivilege people. Subject positions are constituted by and through location and place (Code, 2006). Without this recognition, experience is assumed to be universal. Regimes of inequality work differently in different locations, as the South African case study demonstrates. Too often, the experience of the white (male) child in a high-income context has been taken to be normative (Grech, 2015) in accounts of the impact of disability on learning and schooling and many of the pedagogical practices described as “inclusive” assumes this child’s presence in a well-resourced setting. The experience in many Global South contexts may be very different, where factors at the level of the system, the community and the school combine to impact learning outcomes. Individual schools configure their own “objects of activity” which may make it more or less likely that disabled learners are included (Andrews et al., 2019). And regimes of inequality are exercised beyond the education system, with students’ experiences impacted by encounters with the caprices of the health system, legal frameworks (especially for migrant and refugee students), and economic possibilities and constraints.

Intersectionality demands a commitment to *justice*. Without translating the concept of intersectionality into activism and action, it remains an interesting but abstract concept with no emancipatory impact on people’s lived experience of oppression. Or, as Collins and Bilge (2020, p. 239) note, “intersectionality demands more than simply being critical and entails turning critical analyses into critical praxis”. Drawing on a Freirean concept of critical pedagogy, and linking to disability studies in education, Van Hove et al. (2008) indicate what this praxis might entail. It includes genuine dialog with parents and students; identifying strengths and “goodness” rather than focusing on vulnerability and sources of failure; person-centered planning; acknowledging students’ broader familial network; and three key ways of seeing the Other – as thinking, individual and reciprocal beings. Ensuring safety, belonging and success within a moral framework of participatory parity is how McIntyre (2021) sees social justice operationalized in inclusive schooling. While this author focuses on refugee students, she offers a compelling argument for the possibility of transformed educational spaces that make an academic, social and material difference to young lives.

Intersectionality demands *relationality*. This means allowing for dialog that enables people to navigate their differences. Building “intellectual solidarities between distinct yet interrelated scholarly formations” (Collins and Bilge, 2020, p. 197) is necessary for intersectional work, with conflict seen as inevitable, but potentially creative and generative. Without relationality, intersectional allyship and interdependency are impossible and polarization and competition are inevitable. Interest groups potentially become silos, suspicious of any attention or advantage that other groups may command. “Whataboutery” (a new noun) is invoked when intersectionality is misunderstood and relationality is absent. It says during #BlackLivesMatter, “What about white working class boys?”, as if oppression only pivots on one axis of power. Equally destructive is presuming to pick and choose which axes of oppression do or do not deserve attention, like being “disability-friendly” but homophobic. Relational intersectionality offers “new ways of being in the world” (Lorde, 2019, p. 104) and an opportunity to understand and resist common mechanisms of exclusion.

Intersectionality is an embodied experience (Elg and Jensen, 2012). *Embodiment* frustrates attempts to create hierarchies among regimes of inequality because students are not sequentially raced, gendered and abled, but are simultaneously so. Without considerations of embodiment, intersectional analysis is symbolic. And the violence meted out on intersectional bodies is real, not symbolic. This violence includes, but is certainly not limited to the forced sterilization and menstrual suppression of disabled girls, the rape of disabled girls and women, and pharmaceutical and physical restraints used on disabled boys. The historical and neoliberal valorization of the “ideal fit body” (Grech, 2015, p. 19) necessarily constitutes other bodies as transgressive, in need of control through scrutiny, classification and punishment. The “ideal” body, is, of course, white, male, heterosexual and, compulsorily able-bodied (McRuer, 2010). The “ideal” schooled body is one that complies with instructions to “stand straight, sit still, pay attention, write neatly, tuck in escaped shirts, pull up socks, stop talking, running, hitting, screaming, sniffing, swearing, spitting, chewing” (Dixon, 2011, p. 3). That many bodies can’t or won’t comply offers the possibility for reimagining educational spaces that account for multiple forms of embodiment.

Without recognizing *agency*, intersectionality can drift into determinism. People appear as the pitiable sum of their constituent (devalued) identities with predetermined destinies. The narrative can steer dangerously close to the outdated charitable discourses in which students are gazed upon by “enlightened” critical scholars who catalog their woes. Disability studies in education needs an approach to intersectionality characterized by “resistance, hope and reclamation” (Berghs et al., 2020, p. 8). In Grech’s (2015, p. 90) view, a “focus on negative attitudes and oppression strips disabled people and their households of any form of agency and the ability/possibility to resist and control/change their circumstances, and influence other people’s attitudes and behaviors.” Collective action and activism by disabled students, their families and allies against disablism and other oppressions in the education system needs to be supported. Research needs to be co-produced and stories of resilience and resistance need to be told, rather than chronicles of deficit and misery. The self and community advocacy of marginalized groups needs to be celebrated and amplified.

Moreover, the temptation to saviourism needs to be repelled. The “everyday relational agency” that disabled children have needs recognition, with an acknowledgment of their presence in the community and “the difference they make through it” (McLaughlin et al., 2016, p. 175). Power is, of course, not only repressive. It circulates and can be harnessed in various forms of resistance. Intersectional alliances need to be forged to dismantle the common mechanisms of educational exclusion.

Conclusion: the promise of intersectionality in and for disability studies in education

Intersectionality is not an “optional extra” consideration for disability studies in education, it is central to its concerns. Both are critical projects which challenge relations of power, exploitation and domination. They describe the spaces for counter-hegemonic action and offer the possibility for realizing every child’s right to an inclusive education (UNESCO, 2016). Intersectionality forces disability studies in education to consider the construction of the disabled student not only by ableism and disablism, but also by racism, sexism, classism and other regimes of inequality. It dislodges the gaze from single-identity politics to complex life worlds forged at the cusp of structures and circumstances that simultaneously but differentially privilege and disprivilege. Intersectional allyship that offers “solidarity across movements” (Carlson et al., 2019, p. 892) has the potential to identify and disrupt the common mechanisms of educational exclusion.

The response to exclusion cannot be compensatory measures that render “the included” as perpetual guests, welcome in schools and other educational spaces conditional on their acquiescence and assimilation into normative cultures and practices. Recognizing the effects of inequitable power relationships is a task of the “first order” (Slee, 2011, p. 157) in achieving inclusive education for all, and particularly for disabled students. Intersectionality, with all its necessary component concepts, offers a means to do this recognition work and thereby to begin to forge a more just, democratic and inclusive education system.

Introduction

Inclusive education is a globalized policy discourse that has been variously understood and enacted. Despite its international policy and legal endorsements, inclusive education has been plagued by ambiguity thereby confounding the processes and outcomes of inclusive education policymaking. Inclusive education is grounded in what Norwich (2010: 93) calls “a plural values framework” whereby contradictory values are juxtaposed, contested and negotiated. For instance, values of equity and social justice are frequently marginalized due to the ascendancy of “neoliberal” ideologies that undermine the process of change toward inclusion and social justice (Giroux, 2012; Hursh and Henderson, 2011). The complex and contentious nature of the notion is further complicated by the ways in which inclusive education has become “a traveling theory” (Slee, 2018) and has been intertwined and mediated through diverse “local theories” and socio-political exigencies. The dialectic of the global and local - captured through the ways in which local cultures and ideological dynamics infiltrate and eventually domesticate inclusive educational policies (Robertson 1995; cited in Green 2002) - has given rise to hybrid discourses of inclusion. These hybrid discourses create and exacerbate conceptual ambiguities around the notion and contribute to the ascendancy of contradictory and contentious policy landscapes that reduce inclusion to a special education artifact (Liasidou 2008a).

Even though as early as in 1994 the Salamanca Statement was explicit about the expectation that nation states should ensure that “both policies and financing arrangements should encourage and facilitate the development of inclusive schools” (UNESCO, 1994: 19), this is still not the case. On the contrary, there is global evidence suggesting the resurgence of special education discourses that undermine and confound the processes and outcomes of inclusive education policymaking (Kozleski, 2020; Artiles, 2020; Tomlinson, 2017). The “industry of special education” (Tomlinson, 2012) has not receded, it has become an even more sophisticated social engineering device to protect the interests of general schooling by removing potentially “troubled and troublesome students”, who are perceived to pose a major threat to schools’ unfettered quest for educational excellence gauged against mono-dimensional calibrations of students’ achievement linked to performance indicators, final examination results and data-driven accountability regimes (Armstrong et al., 2011; Dudley-Marling and Baker, 2012). Even more worryingly, this sophisticated engineering device has been masqueraded and legitimized through linguistic veneers aligned with an inclusive discourse. This is part of, according to Slee (2018: 13), “the cunning plan” devised “by exclusionists”, the aim being to “take over the concept of inclusion and arrange an educational system that excludes as far as possible, and in a variety of ways ...”.

Under the siege of what Ball and Olmedo (2013: 85) termed neoliberal governmental technologies, the blame is squarely placed on individual students who deviate from ideals prescribed by the “humanist” subject. The latter constitutes an ontological *a priori* that has engendered and legitimized social hierarchies and dualisms of normative and non-normative ways of being (Goodley et al., 2014: 343). In this context, students with special educational needs and disabilities (SEND) are constructed as being “non-ideal students” (Harwood and Humphry, 2008: 380) and “are often seen as a burden, a problem, a drain on the system, who make no civic contribution” (Campbell, 2012: 214).

The resurgence of special educational thinking is not only manifested in educational practices, but also in the use of language that inconspicuously, yet pervasively, constructs and reinforces individual pathology perspectives and discriminatory regimes that are euphemistically baptized as being “inclusive”. According to Lester et al. (2017: 2):

Language creates, codifies and conveys policy while at the same time macro and micro features of language -from broad rhetorical techniques to specific word choices- shape meanings and understandings of policy.

The realization of an inclusive discourse is partly a struggle over language (Fairclough, 2000). This aligns with Fairclough's theorizations of the "discourse driven" dimensions of educational and social change (e.g., Taylor, 2004). The power of language and its discursive manifestations constitute a significant, albeit occasionally subtle and seemingly innocuous, discursive impediment that, unless problematized and dismantled, will continue to jeopardize the process of change toward inclusion. In this respect, inclusive education reform efforts are, quoting Ball (1993, 15), "set within a moving discursive frame which articulates and constrains the possibilities and probabilities of interpretation and enactment".

Education policies and practices are constituted by and concomitantly engender discursive orthodoxies. The latter embody and are permeated by ideological presuppositions that are mediated and enacted through social practices, relations, and identities. The identification and problematization of discourses underpinning policies can enable researchers to understand why policy developments have been slow in addressing inequity, human rights violations, social injustices and transforming professional practices (Allan and Tolbert, 2019).

Even though official policy by itself does not constitute a panacea for promoting an inclusive discourse (Fulcher, 2015), it, nevertheless, plays a catalytic role in precipitating inclusive education reforms (Barton, 2008; Slee and Cook, 1999). As Ulmer and Lenhoff (2017: 175) point out, policy discourse "does more than passively exist in policy documents ... Rather, discourse is active language that once absorbed into how educational stakeholders think, speak, and act - has the capacity to filter down and influence interactions with individual students". Inclusive education reform efforts aimed at "'patching up' of the insufficiencies of the current education system" (Lindsay et al., 2020: 17) through facile and erroneous policy rhetoric are not only ineffective, but also raise concerns about the ways in which inclusive education has been "reduced to a new name for 'special education'" (Armstrong, 2013: 7).

This article utilizes a discursive analytic approach to problematize national education policy reform efforts, allegedly aimed at mobilizing education reforms geared toward inclusion. A policy discourse analysis (PDA) methodology exposes the euphemisms, fallacies, silences, and ideological messiness of official policy discourses that contribute to the paradoxical rise and consolidation of special education in Cyprus. The globalizing discourse of inclusion necessitates a cross-cultural policy dialogue that can potentially instigate a reflective and critical approach to exploring the challenges of pursuing an inclusive education policy reform agenda. The following section provides a brief overview of the Cypriot context for education, disablement and exclusion. The next section discusses the theoretical and methodological underpinnings of critical policy discourse analysis, while the final section reports on the findings of the study and their implications for the process of change toward inclusion.

Inclusive education policymaking in Cyprus; setting the context

Cyprus has a highly centralized educational system, where the education of children with disabilities has traditionally taken place in segregated special schools,¹ with integration unofficially been implemented since the late 1980s. In 1999 a Special Education legislation² providing for integration, established formal procedures of identification, assessment and provision of special education and support. However, the special schooling and segregated settings and practices are still an option in this law. In 2019 Cyprus has initiated a process still in progress, for education policy reforms in order to meet its legal obligations that arise from the ratification of the UNCPRD in 2011 (Law of 2011, N.8 (III)/2011). Though the procedures are progressing, there is no consensus of the involved stakeholders and groups in consultation (i.e., academics, parents groups, disability representatives), who criticize the new policies as non-inclusive. Despite political rhetoric on the need to address the shortcomings of the existing special education legal framework, the envisaged reforms do not provide, according to the recommendations of the UNCPRD Committee 2017³ "a clear legislative scope of inclusive education". The problematic policy landscape is, *inter alia*, manifested in the ways in which students with disabilities experience multiple forms of disablism, and are denied access to quality, non-discriminatory and equitable forms of educational provision (Liasidou, 2016; Liasidou and Hadjiyiannakou, 2019).

Failure to articulate and act upon a clear vision for an inclusive education reform agenda, can be partly attributed to the historical past of Cyprus and the ways in which issues of human rights and equity have been conceptualized and acted upon in a country that has long been striving to overcome its colonial past and to preserve its national integrity and identity. (Liasidou, 2008b; Symeonidou, 2009). As a result, "Cyprus is still struggling to establish a strong democratic tradition and thereby lacks a focus on human rights issues and equality" (Liasidou 2008b: 235); a historical antecedent that undermines attempts to recognize disabled people as rights-bearing subjects (Degener, 2016).

Developing an informed understanding of the temporal and contextual dimensions of inclusive education policymaking not only provides effective local responses to the challenges and possibilities of fostering greater inclusive policies and practices, but also contributes to a cross-cultural policy dialogue on the commonalities and idiosyncrasies of different socio-political systems and the ways in which they can address similar challenges of pursuing inclusive education reforms (Barton and Armstrong 2007).

Critical policy discourse analysis

Linguistic approaches to education policy analysis have played an important role in exploring the role of discourse in promoting certain policy discourses at the expense of others, as well as providing nuanced insights into the ways in which these discourses are instantiated, negotiated, hybridized, antagonized, played out and enacted in the process of policy constitution and dissemination (e.g., Taylor 2004). Discourses are “broader ideas” communicated by text, speech and cultural artifacts that create meaning, construct human identities and social realities. A “text’s linguistic structure” for example “functions, as discourse, to highlight certain ideologies, while downplaying or concealing others” (Machin and Mayr 2015: 200). As Fairclough (2000: 1) contends while analyzing the ways in which language is used to obfuscate relations of domination: “Looked at from a language perspective, different representations/visions of the world are different ‘discourses’”. From a discourse perspective, policy making is, therefore, regarded as being implicated in the “politics of discourse” whereby different discourses compete for ascendancy (Yeatman, 1990; as cited in Fulcher, 2015).

Discourse theory has been widely used in education policy analysis to foreground dominant and marginalized policy discourses, as well as hybrid discourses that confound the processes and outcomes of education policy making (Ball, 1990; Marshall and Patterson, 2002; Taylor, 2004). Unlike other conventional policy analysis approaches that adopt a so-called rational/scientific lens to explore policy constitution and dissemination, Policy Discourse Analysis (PDA), “seeks to understand and disrupt systems of oppression and assumptions guiding inequitable practices” (Allan and Tolbert, 2019: 141).

Thus, PDA offers an alternative to conventional approaches to policy analysis by recognizing language as a pervasive, yet opaque, source of social power, and affording “policy scholars the opportunity to examine discourse-based constructions of key policy issues, including those related to (in)equity, the construction of targeted groups, articulation of political agendas, emergence conflict, and so on”. (Lester et al., 2017b: 57). PDA scholars are, therefore, socio-politically committed to exposing the subjugating effects of discourse, including prejudiced discourses (Van Dijk, 1984), which are produced and reproduced in subtle yet pervasive and pernicious ways and ultimately undermine inclusion.

PDA is informed by an interdisciplinary methodology drawn from critical, post-structural and feminist traditions and focuses on exploring the role of discourse in framing policies and promoting social justice (Allan and Tolbert, 2019). Dominant understandings of discourse in the context of policy analysis capture and embody Foucauldian notions of power in constituting social realities and human subjectivities and creating the ‘discursive contours’ within which inclusive and special education policy problems, solutions and subject positions are constituted (Liasidou, 2008a).

Foucault (1984) was particularly interested in problematizing and foregrounding the precarious nature of “truth” and “knowledge” and sought to provide a genealogical analysis of the provenance of certain “regimes of truth”, as these were manifested within specific socio-political contexts. Foucault was also interested in exploring issues of representation and theorizing the ensemble of discursive dynamics that are accountable for the constitution of social realities and human subjectivities in policies. Policy discourses are thus conceived of as being entangled in the power/knowledge couplet that shapes the ways in which “policy mobilizes educational discourses (of teaching and learning) to produce particular forms of subject positions” (e.g., the child additional support needs) (Burman, 2017: 70).

Policy discourse analysis methods

Policy discourse analysis (PDA) methodologies draw insights from Critical Discourse Analysis (CDA) (Gildersleeve and Hernandez, 2012; Lester et al., 2017a) that constitutes the most common discursive analytical approach utilized by education policy analysts (Lester et al., 2017b). CDA provides a “critical lens” through which policy scholars can explore and develop understanding of the ways in which “discursive practices may have major ideological effects that is, they can help produce and reproduce unequal power relations” (Wodak and Meyer, 2016: 6). The ideological constructs of policy documents are manifested and embodied in lexical choices, metaphors, rhetorical operations (e.g., parallelism, metaphor, deixis), euphemisms and polarizations, as well as other linguistic properties of the text that are constitutive elements of social reality (Van Dijk, 2016). Language is reified through discourse and acquires “ontological potency” to construct human identities and to ascribe meaning to “social reality”. Even single words or the absence of these words convey the pervasive effects of discourse in constructing human identities and ascribing meaning to social reality (Luke, 2002).

Fairclough (2016: 87) uses the term “semiosis” to encapsulate the “meaning-making” dimensions of discourse “as an element of social process”, and explains the ways in which discourse analysis focuses on different “semiotic modalities” embodied in language that is “dialectically related” to other elements of the social process; “interdiscursive analysis” constitutes “a mediating ‘interlevel’ which connects both linguistic analysis with relevant forms of social analysis” (Fairclough, 2016: 94). Discourses, therefore, do not exist in a spatial-temporal vacuum; they embody temporarily and spatially mediated knowledge and are embedded in, reified, and captured through an intricately and reciprocally related web of institutional, administrative, political, ideological, and other dynamics; hence the adoption of a “dialectical-relational approach” to delineate the nexus of language, power and exclusion (Fairclough, 2016: 88).

Thus, CDA is not limited to the linguistic micro-structures of the text, it extends to explore the ways in which “social relations, power, institutions, beliefs and cultural values are in part semiotic” (Fairclough, 2016: 87), while foregrounding the ways in which the linguistic/semiotic aspects of the text are implicated in the construction of “social wrongs” and subjugated human identities. In

this respect, the analytic edge moves to their higher stages of a discursive analytic approach, namely interpretation and explanation (Fairclough, 2001a), in order to explore the ways in which policy discourses are shaped against, and are the embodiments of wider socio-political dynamics and power imbalances, the aim being “to contribute to addressing the ‘social wrongs’ of the day; in a broad sense-injustice and inequality, by analyzing their sources and courses, resistance to them and possibilities for overcoming them” (Fairclough, 2016: 94).

Our selection of policy documents followed the policy discourse analysis steps recommended by Allan and Tolbert (2019) and Fairclough (2016). First, we identified the chronological period that the analysis should focus on and engaged in desk-based research to identify our theoretical sample, which is determined, according to Fairclough (2016: 95) by “how a research topic is constituted as an object of research”. The aim of the study was to address the following research questions:

- What discourses have informed the policy portrayals of problems, responses and subject positions linked to the education of children with Special Educational Needs and/or Disabilities (SEND)?
- How do these discourses re/produce special education imperatives that undermine the process of inclusive education reforms?

The corpus data (theoretical sample) of our policy discourse analysis endeavor consisted of online material derived from the Primary Education and Special Education webpages linked to the Cyprus Ministry of Education, Culture, Sports and Youth (MECSY) Website, as well as the following governmental documents that were published after 2019 and deemed to be best suited to address our research questions (Lochmiller and Lester, 2017).

- Europe 2020 Cyprus National Reform program, April, 2020⁴
- White Paper of Inclusive Education Law of 2019 «Ο περί Ενιαιίας Εκπαίδευσης (Δομές Υποστήριξης) Νόμος του 2019» and the accompanying Explanatory Note («Επεξηγηματικό Σημείωμα»)
- Formation of a New System for the Evaluation of the Educational Practice and Teachers, January, 2019⁵

The identification of the theoretical sample of the study was followed by the Analysis and Interpretation of the data using a discursive analytical approach as discussed earlier. The process of analysis was data driven (Namey et al., 2008), meaning that the thematic discourse categories were derived after reading the documents to minimize research bias. This was followed by the writing process with the aim, following Allan and Tolbert’s (2019: 144) policy discourse analysis process, “to illustrate dominant discourses and subject positions with thick, rich description that includes data excerpts representative of the range of sources examined”.

Bearing in mind the socially-just orientations of CDA, the emphasis is placed on bringing to the fore and problematizing the “social wrongs” (Fairclough, 2016: 95) embodied in articulations and instantiations of policy discourses. The identification of these discourses is followed by an analysis of the ideological effects of discourse and their implications for perpetuating the special education status, while articulating alternative policy “imaginaries” (Taylor, 2003) which despite their idealistic nature they are, nevertheless, “possible and indeed exist” (Fairclough, 2016: 105).

Despite the emancipatory “knowledge interest” and social change orientations of CDA (Fairclough 2001b: 230), policy discourse analysts should act reflexively and “be cautious of contributing to a new regime of truth” (Allan and Tolbert, 2019: 145). CDA has been characterized as an “ideological interpretation” and not an “analysis”, due to the subjective and selective interpretation and explanation of empirical evidence (Wetherell, 2001; Wood and Kroger, 2000). As a counterargument, Fairclough (2016) asserted that the theoretical underpinnings of CDA call for multiple interpretations and multi-perspectival analytical frameworks; A discourse is not static; it constitutes a “dynamic semiotic entity that is open to reinterpretation and continuation” (Reisigl and Wodak, 2016: 27) depending on the aims and focus of the research endeavor. Hence, Critical Discourse Analysts are explicit about their “positionality” and social justice orientations to decipher and interrogate the subjugating and discriminatory effects of (special education) discourse (Titscher et al., 2000), while trying to ensure that their interpretations are characterized by logical reasoning and are firmly embedded in empirical and theoretical evidence (Wood and Kroger, 2000).

Analysis and discussion

The coding and analysis schemes were developed based on the aims of the research questions looking into the conceptualization of special education and inclusive education in policy documents and the position of the competent policy-making governmental agencies such as the Cyprus Ministry of Education, Culture, Youth and Sports (MECSY). Dominant policy “discourses” include or consist of, drawing on Machin and Mayr’s (2015:21) typology, participants, locations, valued-based assumptions, behaviors ideologies and goals. Thus, codes included issues of childhood assessment and identification (e.g., diagnosis, medical/doctors, psychometric), issues of educational structures, placement and services (e.g., intervention, special education, support, school etc.), and issues of processes in relation to education, also including provisions and relevant definitions in official documents (e.g., differentiation, universal design for learning, other children, vulnerable groups, accessibility, different, comparison). Analysis was based on both the presence and absence of codes that were analyzed against the following themes: (a) individual pathology and deficit-oriented discourses, (b) minority rights discourses, and (c) discursive absences and policy silences.

⁴EU 2020 Cyprus National Reform Program: https://ec.europa.eu/info/sites/info/files/2020-european-semester-national-reform-programme-cyprus_en.pdf.

⁵Formation of a New System for the Evaluation of the Educational Practice and Teachers: <http://www.cna.org.cy/pdf/ant/06072019.pdf>.

Individual pathology and deficit-oriented discourses

The official website of the Cyprus Ministry of Education, Culture, Youth and Sports (MECSY), circulars and guidelines pertaining to the education of children with SEND, are underpinned by deficit-oriented and assimilationist perspectives. For example, rather than articulating a vision for inclusion and its pedagogical implications for adapting teaching methodologies and curricula to respond to the needs of learner diversity on the grounds of SEND, the emphasis is solely placed on enabling students to “adjust to the school environment”⁶ while stating explicitly that one of the key aims of the Department primary Education is “the increase of special education programmes and of programmes which support pupils with learning difficulties”.⁷ The notion of inclusion on the grounds of SEND and its human rights and learner diversity considerations (e.g., [Armstrong, 2017](#); [Acevedo and Nusbaum, 2020](#)), are glaringly absent, despite an emphatic acknowledgment “that there is awareness of the multicultural trends which are developing in the modern world”.⁸

Paradoxically, even though a national inclusive education reform agenda geared toward inclusion is underway, special education discourses and the institutional paraphernalia associated with it (special schools and special units) are defined as being one of the areas that the Department of Primary Education is responsible for, including the “support services offered to children with special needs who are taught inclusively in public primary and Pre-Primary schools”.⁹ The reference to alleged inclusive teaching arrangements is eclipsed by a poignant articulation of the role of diagnostic calibrations and therapeutic interventions:

The special needs of children with disabilities or other special educational needs are served and addressed effectively through the services and programs offered by Special Education, the operation of which aims at both early diagnosis and the provision of appropriate therapeutic interventions¹⁰.

A similar discursive paradox is evident in “The Explanatory Note” of the White Paper which states that “inclusive education is based on the social and not the medical model of diagnosis and intervention at an individual level”. Yet in paragraph 9.2 of the White Paper it is noted that “the provision of specialized support is decided after evaluation and decision from the Evaluation and Support team, which may include medical, psychological and other opinions”. Contrary to the alleged social model policy orientations, the reform policy document, embodies the “model of professionalism” that is aligned with the medical model of diagnosis ([Tomlinson, 2017: 105](#)). Additionally, the document refers to students’ placement in “multipurpose support infrastructures” or in a “Resource Center for Inclusion” (the two are defined separately) where students will be supported in accordance with specific timeframes based on their Individualized Educational Program (IEP). The ways these organizational arrangements are defined make painfully invisible how “dis/ability labels conceal the conflation of inadequate opportunities to learn”, and are used as a pretext to create “a polarized space” ([Kozleski, 2020: 343](#)); special schools and special units.

Along the same lines, the models of general, enhanced and specialized support suggested by the new White Paper (Part II, article 6) fundamentally reproduce the existing segregative educational structures of special education. The three tiers of educational support are presented as consecutive stages, in a form of a seamless progression across levels, based on the assumption that one will follow the other in case the first one fails to accommodate students’ educational needs. In essence, this leveling will function as a normalization process and subsequently, an “exit ticket” from inclusive education, for all students who do not respond to existing educational arrangements and for whom the “general model” will prove “inadequate”.

The sporadic enunciations of inclusion in the White Paper are reduced to the creation of the so-called “Resource Centers for Inclusion” that are a euphemistic rearticulation and re-configuration of existing “resource units” attached to mainstream schools, or even the existing special school as it is specifically noted in article 13(b) of the White Paper, referring to the “mutation” of the public special schools. This is an example of what [Fairclough \(2016: 89\)](#) calls, “a ‘colonizing’ recontextualization of discourses” and in this case “special education discourses” that have been semantically disguised and presented as being “inclusive”. Once a student is placed in a resource unit (see Resource Centers for Inclusion), this is considered a permanent and administratively convenient “modus operandi” of providing learning support to students with SEND ([Liasidou and Antoniou, 2013](#)).

The same individual pathology perspective is echoed in another official document allegedly aimed at the “Formation of a New System for the Evaluation of the Educational Practice and Teachers” published in 2019. The document uncritically refers to students “special education needs” and silences the dynamic and “evolving” nature of disability and special educational needs that results from the interaction of a person’s impairment with institutional and environmental barriers ([United Nations, 2008: 1](#)).

The dominance of the dichotomous thinking of special and general education, is also mirrored in the exponential increase of students who are placed in special schools and Resource (Special) Units which operate mostly as a separate class setting for a small number of students within the mainstream school environment. [Table 1](#) shows the numbers of students in Special Schools and Resource (Special) Units in the previous eleven academic years (2010–21). Data related to 2004–05 is also included as it represents

the first year that numbers of students are available. The data presented in the Table below is a clear indication of how the numbers of students educated in segregative settings have increased over years, in comparison with the total number of and disproportionate increase of students in primary schools.

Based on the data provided in the Annual Reports on the Ministry of Education, Cultures, Sports and Youth, as well as according to the “Statistics of Primary Education Department”¹¹ in 2004–05 there were 295 students who attended the nine special schools in Cyprus. As presented in **Table 1**, there has been a gradual increase of this number so that in 2020–21 there were 498 students in special schools, even though the number of students in primary schools decreased during the same period (57,574 students in 2004–05 and 51,541 students in 2020–21). It is noteworthy, that the number of students in special schools does not include students who are in other forms of segregated provision in mainstream schools (e.g., Resource Units), who are presented in a different column in **Table 1**. In addition to the above, the European Agency for Special Needs and Inclusive Education database¹² shows that in 2014–15 the Ministry reported that 583 (379 primary and 204 secondary education) students with an official decision of SEN were educated in Resources (Special) Units (separate special classes in mainstream schools). According to the latest available data, the number of these students increased to 687 (471 Primary and 226 Secondary) the following year (2016–17). These numbers do not include those students who are educated in Resource Units on a part-time basis and whose numbers have also increased in both primary and secondary schools (5498 in 2016–17 and 4603 in 2014–15). It is probably worth noting that in the last 5 years the increase of numbers of students moving to segregated settings of special education was more progressive, albeit the enhanced efforts of organized parents and disability activists to promote inclusive education, especially after the ratification of the UNCRRPD. Paradoxically, it seems that after 2014 the number of Resources (Special) Units is even more progressively increasing. This could be interpreted as an effort of the state to give a pseudo-inclusion (integration) sense to the education of children with disabilities, by providing the opportunity to be educated in the mainstream school environment, but separately from their peers and outside the mainstream classroom.

Minority rights discourses

Despite the change in nomenclature, the White Paper conveys a “minority rights” perspective that emphasizes “deviance” from the norm (e.g., students without additional support needs), rather than a “universalist approach” that focuses on modifying the social norm with a view to accommodating learner diversity (Kayess and French, 2008). In the definitions Section of the White Paper the target group for the suggested education law is defined as “vulnerable and special groups of student population”. Even though, minority rights “might protect key features of human identity” they nevertheless “possess the capacity divide people ... (and) create insiders and outsiders” (Macklem, 2008: 531), thereby perpetuating power imbalances, educational injustices and discriminatory regimes that undermine the rights-bearing subjectivities of those who have been “Othered”. For example, in the White Paper “reasonable accommodations” are defined with reference to “disproportionate treatment in relation to other children”, misinterpreting the definition in the UNCRRPD of providing “necessary and appropriate modification and adjustments not imposing a disproportionate or undue burden” (Article 2). The White Paper’s definition is based on a dis/ability ontological comparison that contributes to processes that exclude and “others” minority identity students. The process of ontological bipolarization and

¹¹ MECSY Primary Education Statistics: http://archeia.moec.gov.cy/mc/407/statistika_el.pdf.

¹² European Agency for Special Needs and Inclusive Education [Table 3: Children/learners with an official decision of SEN (european-agency.org) https://www.european-agency.org/data/cyprus/datatable-overview?year=2016_2017&field_year=2016_2017#tab-official_decision_on_sen].

the associated nomenclature of constructing “educational outcasts” such as, according to Slee (2018: 53) students with “special educational needs” or a seemingly more sensitive rendition: “additional needs” are, “bureaucratic illusions” that lack clear demarcation criteria to unequivocally determine:

At what point does need become additional or special? They are certainly not stable constructs. They are management techniques and though the packaging becomes ever-more sophisticated, the assumptions remain crude (Slee, 2018: 53).

Moreover, the phraseology of “additional support needs” promotes an indiscriminate, yet stigmatizing, approach which dissolves disability issues in education into a nebulous inclusive education bandwagon (Norwich, 2002). Disability-related needs are thus subsumed within the category of “students with additional support needs”, thereby raising concerns about the effectiveness of these broader definitions to meet students’ needs. As Norwich (2002: 493) writes, the effect of such an indiscriminate and all-encompassing approach “could be to dissolve disability issues in education into a wider more amorphous inclusive education”.

The minority rights approach is further manifested in the intention of the White Paper to introduce three tiers of intervention in mainstream schools whereby the general support is offered to “vulnerable groups” without the need to have an “official decision”. Rather than raising the need to provide quality first teaching and school wide positive behavior supports and interventions to meet the academic and social needs of all students in the first tier of intervention – that is universal and preventive in nature – (Scott, 2001; McIntosh et al., 2011; Simonsen et al., 2008), students are *a priori* pathologized and imputed a “vulnerability” status, which is unproblematically presented as an endogenous characteristic of the child. This assumption preempts that some students are “found lacking” (Kozleski, 2020: 350) and therefore incapable of benefiting from the “general model of support”; this presumption contradicts the White Paper’s rhetorical claim about the implementation of universal design for learning and differentiation as a means of mitigating inadequate student learning support (Florian, 2019).

Discursive absences and policy silences

The special education reform efforts are part of a general education and skills reform and childhood care enhancement agenda as articulated in the 2020 National Reform Program.¹³ Section 3.3.2 (pp. 42–44) refers to reforms of the educational and training system without making any reference to inclusive education reforms or issues related to disability rights in education, thereby failing to acknowledge the education, training, and counseling needs of individuals with SEND. This omission is indicative of the absence of a disability rights perspective in political and policy agendas.

Similarly, education specific disability issues are also silenced in the National Reform Program in references of accessibility and digital inclusion (p. 24). Even though accessibility explicitly refers to disability, the relevant objective of the Program solely includes the harmonization of national legislation with the EU Directive on informative Websites accessibility, while the corresponding Law (N.50(I)/2019)¹⁴ does not apply to school-based websites, nor to online educational content. Following the same pattern, the e-learning section of the MECSY¹⁵ website that was launched as a response to the Covid-19 pandemic entirely omits inclusive education and disability related issues in the guidelines and resources provided to educators, in a way that blatantly violates the right of learners with disabilities to maintain access to education.

Simultaneously, the alleged inclusive education reform efforts silence the need to proceed to a radical overhaul of the education system as a whole and to render educational professionals accountable for all students’ learning. This weakness has not been addressed by the envisaged education reform efforts, notwithstanding the recommendations of a World Bank report on the Cyprus Educational system in 2014. The report was commissioned by the World Bank in close collaboration with the Ministry of Education and Culture (MoEC) of the Republic of Cyprus and provides a number of evidence-based policy reforms that need to be pursued in order to improve teaching and to enhance accountability regimes for students’ learning (see Liasidou and Symeou 2018). Failure to address these “general policy issues” undermine, according to Norwich (2019: 2), attempts to address “the important questions in the SEN and inclusive education field”.

Hence, the articulation of a clear framework of accountability in relation to students’ learning is imperative to improve the educational outcomes of all students, including students designated as having SEND (Liasidou and Symeou, 2018). As discussed earlier, the nomenclature of “additional support needs” adopted in the White Paper also silences the role of teachers in preventing, minimizing and addressing these needs.

Inclusive education reforms necessitate a clear articulation of the role of teachers and their “curriculum and pedagogic development” (Lindsay et al., 2020: 17), with a view to creating effective and non-discriminatory learning environments for all (Alves, 2020; Florian, 2019). This perspective constitutes a *sine qua non* element in fulfilling the aims of a student-centered and rights-based education reform agenda. Schools and teachers should, therefore, be legally mandated to focus resources on developing empirically validated learning programmes and support mechanisms (Lavonen, 2018) that minimize the need for alternative educational

placements and compensatory measures of support. In parallel, the focus also needs to be placed on exemplifying the role of schools and teachers in ameliorating wider social inequalities that are responsible for the poly-victimization and hence the “vulnerability” of these students.

Another related policy document of interest is entitled: “Formation of a New System for the Evaluation of the Educational Practice and Teachers” published in 2019.¹⁶ The extended document exemplifies the development of a new assessment system for both schools and teachers. The quest for inclusive education does not seem to be part of the Ministry’s vision to enhance the quality of education provided. As a result, schools’ and teachers’ proposed assessment criteria are not contingent on their ability and professional expertise to remove educational barriers that might create or exacerbate students’ “special educational needs”. The document conveys the presumption that students’ “needs” are a part of their genetic and biological makeup and this conjecture is further reinforced by the recurrent use of the term “special needs” rather than “special educational needs”. The educational dimension is not only semantically absent from the document’s reference to students’ needs, but is also absent from the overall conceptualization of the role of schools, teachers and pedagogy to create quality learning environments so as to meet the needs of learner diversity.

Despite the unequivocally pivotal role of teachers’ pedagogies, the document does not capitalize on their potential to facilitate inclusive education reforms, or preserve failed orthodoxies. Thus, teachers’ and deputy headteachers’ evaluations are solely gauged against their managerial and bureaucratic ability to deal with paperwork as they are merely expected to: “Hold the necessary information regarding possible special needs of specific students” (p. 168 for teachers and p. 188 for deputy heads). The same applies to headteachers and inspectors who, rather than being expected to “monitor the level of inclusivity of schools” – as discussed by Alves’ (2020: 76) analysis of the process of inclusive education reforms, they are merely expected to: “Create a file that includes the necessary information regarding possible special needs of specific students” (p. 207), and “Encourage and inspect the keeping of a file which includes the necessary information regarding possible special needs of specific students” (p. 223) respectively.

Thus, even though one of the specific aims of the Cyprus National Reform Program is to introduce a teacher evaluation framework, it is still acknowledged that “Teacher evaluation remains a major challenge” (CCOD-Cyprus Confederation of Organizations for the Disabled, 2020: 43). While being cognizant of the perils of uncritically resorting to the “politics of blame” that dictate that “the capacity to deliver an inclusive educational system is largely perceived to be an issue of teacher readiness or (...) a matter of improved teaching” (Done and Andrews, 2020: 450), regular teacher evaluations are imperative (World Bank, 2014, p. 6), to ensure that the needs of children with disabilities are met in effective and non-discriminatory ways.

Conclusions

The unfettered rise of special education in Cyprus is paradoxically witnessed amidst education reform efforts allegedly geared toward inclusion. The former has been semantically manipulated and embellished to provide the illusion of transformative change. The value of policy discourse analysis lies in its potential to expose the fallacies, ideological messiness, and silences of official rhetoric, while rendering policymakers accountable not only for the “validity of the educational systems they establish” (Sirotnik, 2004:155 cited in Lochmiller and Lester, 2017: 249), but also for their lack of reflexivity on how they use language to construct policy meanings and student identities (Liasidou, 2008a).

Bearing in mind the lingering legacy of special education and the patent lack of political will to challenge the educational status quo, the rise of special education can potentially be curtailed by the emerging role of disability advocacy groups and organizations in exercising “policy leadership” and creating a new “arena” wherein the “policy as a struggle” metaphor is negotiated and enacted (Fulcher, 2015). Recently, the Cyprus Confederation of Organizations for the Disabled (CCOD) and other disability organizations submitted a request to the Committee on the Rights of Persons with Disabilities to launch an “Inquiry regarding the violation of article 24 of the Convention on the Rights of Persons with Disabilities under the current education system as well as with respect to the ongoing reform for inclusive education in Cyprus” (September 2020). The Inquiry provides a poignant and substantiated analysis of ways in which the State fails to meet its legal obligations that derive from article 24 of the UNCRPD by exemplifying and documenting the ways in which students with SEND are discriminated against, stigmatized, marginalized, and excluded in education. Going even further, the organizations declared their intention to take legal action against the MECSY and its failure to exhibit “political will in the direction of complying with the Convention and the aforesaid Concluding Observations with the adoption of a true inclusive education” (CCOD-Cyprus Confederation of Organizations for the Disabled, 2020: 7).

Parents of children with special educational needs and their organizations have played a central role in leveraging collective disability advocacy efforts to launch the Inquiry. Even though their efforts to counteract disabling discourses in education policy and professional practice are still embryonic in nature (Liasidou and Hadjiyiannakou, 2019), they have, nevertheless, managed to not only foreground their hitherto marginalized voices, but also to turn them into individual and collective forms of legal action to dismantle what is seen as the tyrannical legacy of special education (CCOD, 2020). Disability advocacy for inclusive education can, nevertheless, be more powerful when meaningful relationships are built between education professionals and families (Symeonidou and Mavrou, 2019) to jointly lobby the government to change political rhetoric and professional practices. The resurgence of special education in policy discourses undermines not only the effectiveness of educational reforms for inclusive education, but also hinders educational professionals’ preparation, readiness, and motivation to implement

¹⁶Formation of a New System for the Evaluation of the Educational Practice and Teachers: <http://www.cna.org.cy/pdf/ant/06072019.pdf>.

pedagogies of inclusion (Symeonidou, 2017). As the analysis in this article suggests, the case of Cyprus constitutes another example of “patching up” the system rather than “systemic change”. As a result “(t)he development of an inclusive education system (...) continues to struggle” (Lindsay et al., 2020: 13), and will continue to struggle, unless there are concerted disability advocacy efforts and political will to problematize and dismantle education policies that masquerade, rationalize, euphemize and perpetuate the special education status quo.

Recent “debates” in special and inclusive education are perhaps better described as controversies. That is, rather than systematic point-by-point analyses of opposing statements that can be evaluated for logic and veracity, competing assertions have been made about the nature of disability and its implications for education, usually without rebuttal.

In actual debates, side-by-side arguments are made pro and con, and then there is opportunity for rebuttal by both sides. Judges may decide who won the debate because of better argumentation. This has never been the case in “debates” of inclusive and special education, although in some cases there have been responses to statements or even rejoinders to responses (e.g., Anastasiou and Kauffman, 2019; Anastasiou et al., 2015; Kauffman and Sasso, 2006). We do not consider ourselves or any authors cited sole proprietors of truth, or always the right or best advocates for persons with disabilities. However, we have committed ourselves to a scientific search for truths in order to align ourselves with people with disabilities in the quest for a better education. One cannot expect positive results from educational controversies when their pioneers fail to respect the view of the other side of the controversy. Perhaps, in this volume on *Inclusive Education & Disability Studies in Education*, some colleagues will view us as dissidents. Nevertheless, we think that the investigation of truth and the search for what will bring about the best lives for people with disabilities involves the investigation of the opposing views of dissidents. Bearing this in mind, we try to follow a dialogical style in this article. We present dominant points of view in *disability studies*. We address them as conjectures and then develop our refutations. We apply the term controversy rather than debate in the remainder of this article.

The most prominent recent controversies in special and inclusive education have involved two major issues: First, the concept of disability and the legitimacy of special education in response to it and, second, the nature and meanings of inclusion. Important to note here is that the United Nations’ *Convention on the Rights of Persons with Disabilities*, in its Article 24; General Comment 4 (CRPD Committee, 2016) on the right to education calls for full inclusion as a goal without defining *full inclusion* and without using the term *special education* or addressing the issue of the quality of education for students with disabilities (Anastasiou et al., 2018; Hyatt and Hornby, 2017).

We would be remiss were we not to acknowledge that some individuals adhere to philosophies abjuring science, the testing of hypotheses, making measurements, and collecting data, considering these vestiges of modern modes of thinking that are no longer applicable in postmodern or constructionist conceptual models guiding professional practice (Anastasiou and Kauffman, 2011, 2013). Contrary to constructionism-relativism that denies the very existence of reality or the possibility of approximation of truth (thereby confusing facts, uncertainties, speculations, and opinions, without reality checks) we follow a different approach. We pursue scientific truths using data and corroborated evidence, based on the scientific method and analytical thinking informed by sound, relevant theories (Blackburn, 2005; Bunge, 2017; Neiman, 2008; Rauch, 2021; Specter, 2009). This is similar to the basis for work in the “hard” sciences (e.g., physics, chemistry, biology) and in many applied sciences (e.g., medicine, nursing, agriculture). This empirical, rational, and scientific-realistic approach has been far from dominant in all the social sciences, and this applies to some of the literature on this topic.

Our perspectives on the controversies around inclusive and special education and those who share our views are described in more detail in a variety of publications. Among these many publications, including others cited in this article, are: Ahrbeck et al. (2018), Anastasiou et al. (2015, 2018), Correia (2018), Felder and Schneiders (2016), Hornby (1999, 2014, 2015), Imray and Colley (2017), Kauffman (2020), Kauffman and Farkas (2022), Kauffman and Hung (2009), Kauffman and Lopes (2007), Terzi (2010).

Diverging approaches to disabilities

Appreciating the basis for recent controversies requires understanding the history of special education. In some Western European countries and the United States of America (USA), that history goes back more than a century and grew in the context of the beginning of universal public education, whereas in some developing countries such history is much shorter. However, the controversies of recent years go to the core problem of special and inclusive education in any country’s system of universal public education.

Prefatory comments in what was likely the first textbook in special education included the statement that the problem of special education “is found in the fact of variability among children to be educated” (Horn, 1924, pp. 6–7). Educators today are faced with the problem of what human variability to recognize as critical to their work, what to call that variability, and how best to accommodate that variability.

The accommodation of disabilities should not be equated with the accommodation of cultural differences (e.g., race, ethnicity, or gender differences) for the purpose of education (Anastasiou and Kauffman, 2012; Kauffman, Burke et al., in press). Not all human variability has to do with disabilities, especially not with disabilities in learning. Mind-related disabilities represent significant limitations in learning that are best addressed by efforts to ameliorate their effects. Programs such as special education are then appropriate in helping individuals take advantage of the *right to learn*.

An alternative view, the “social model of disability,” starts with the dichotomy between impairment and disability (see Anastasiou and Kauffman, 2013). While *impairment* is viewed as a cognitive or physical dysfunction, *disability* refers to barriers created by society (Barnes, 1991; Oliver, 1996). Disabilities are therefore seen as societal failures to recognize and accept impairments, thus denying the realities of these impairments and their consequences. There are two types of issues here.

The first type is conceptual issues. Even if we remove all the disabling social, attitudinal and legal barriers that lead to discrimination, in some instances (e.g., mind-related impairments, including severe intellectual impairments, low-functioning autism,

severe communication disorders, severe psychosocial disorders, learning disabilities, post-traumatic stress disorder), the *impairments* remain and are potentially detrimental to learning (Anastasiou and Kauffman, 2013; Riddle, 2014). Thus, an initial methodological distinction between impairment and disability is elevated to an ontological distinction, that is, about the nature of being or reality (see Anastasiou and Kauffman, 2013).

The second type is social justice issues. If disability is just another cultural difference, then the *politics of recognition* or *politics of cultural difference*, that is, the struggle to remove cultural barriers, and the achievement of equitable social and political participation, might serve the interests of people with disabilities (Anastasiou and Kauffman, 2012; Anastasiou et al., 2016). This kind of politics makes sense if the barriers to educational attainment for students with disabilities are largely environmental, cultural, or legal, as it often is for individuals with body-related disabilities, including physical and sensory disabilities. For those, the barriers to educational attainment for students with disabilities are largely physical rather than mind-related, and *equality as inclusion* then makes sense (Anastasiou et al., 2018). However, when the barriers to educational attainment are deeply intertwined with the neural architecture of learning, as often is the case for individuals with mind-related impairments, then meaningful educational opportunity will likely require much more than the individual's physical presence in the same classroom as children who are not impaired (Anastasiou et al., 2018). In these cases, *social justice* as the *politics of redistribution* requires additional resources to compensate for learning disadvantage. These additional resources include special education and expansion of meaningful economic and social opportunities (Anastasiou et al., 2018, 2016).

Disabilities and education

Universal public education requires attention to ways in which human beings vary from one another and deciding how this variability is relevant for particular groupings of individuals to be taught. Bateman (1994) has suggested that determining the who, how, and where are perpetual issues for special education. Human variability takes many forms, with the variability we call disability having particular implications for education.

Part of the problem contributing to recent controversies is failure to consider the meaning of a particular variability or diversity among students for their education. That is, people sometimes confuse or fail to understand the differences among differences, the diversity in diversities. In the USA, for example, skin hue or ancestry has sometimes been confused with disability in arguments for educational placement of students with disabilities, leading to the untenable conclusion that the USA's Supreme Court's statement that "separate is inherently unequal" applies to disabilities as well as to skin color (e.g., Stainback and Stainback, 1991). Clearly, skin color and disability are very different with quite different implications in the matter of education (Kauffman and Badar, 2020; Kauffman and Landrum, 2009).

The particulars of abilities and disabilities

Another problem contributing to recent controversies is that particular abilities and disabilities have extremely different implications for education. To figure out what must be taught and how, and what are reasonable expectations, the specifics of disabilities, such as cognitive and sensory impairments must be considered. Adding to this problem is that special education includes hyperabilities (typically called gifts and talents) (Callahan et al., 2020). Moreover, twice-exceptional individuals, those with both a disability and a special gift or talent, must also be considered. Thus, the observation that someone has a hyper-ability or a disability or both has little meaning for education until the specifics of ability and disability are considered.

Variability among situations

Systems and traditions of public education vary enormously from country to country. Considerable variation exists in the grouping of students for various activities, services offered in and through public education, typical class size, ethnic and language homogeneity, and expectations of outcomes. Controversies in special and inclusive education require understanding at least five dimensions of difference: (a) the relevance of particular variations or diversities of students to their education or schooling, (b) how education or schooling is different from other community activities, (c) the particulars of abilities and disabilities of individuals, (d) the diversity of teachers' skills and demands or situations, and (e) the particulars of a country's system of education. Recognition of these dimensions of difference require some system of measurement or categorization.

Quantification, measurement and categorization

Some disabilities are judged comparatively easily (i.e., compared to other disabilities) and relatively objectively (i.e., compared to other measures). However, no matter the measure (e.g., of visual acuity, hearing loss, academic achievement, language acquisition, intelligence), the actual criterion for defining disability is arbitrary. That is, people decide what to measure, how to measure it, and the significance of the findings, and they can change the measurement criterion (e.g., for defining such things as intellectual disability, visual acuity, hearing loss, or low birth weight) basically because the quantification of qualities involves boundaries, and these boundaries are typically blurred.

Diversity or difference needs measurement, even if that measurement is simply binary, for example yes/no, or on/off. The only way we can get rid of scientific categories is to have no quantification and measurement at all. This would mean a return to

prescientific and hugely stigmatized concepts (e.g., laziness, foolishness, stupidity). This may satisfy romantic anti-quantification sentiments, but it would work against the interests of people with disabilities. Measurement often involves a continuous variable, and when it does disability or other diversity is defined by a cut-off point in a statistical distribution of measurement values (Kauffman and Lloyd, 2017). Furthermore, as we have noted, all measurement, even if it is a binary judgment, results in categorization (e.g., does/does not have disability).

Controversy about the nature of disability

The way one views disability has important implications for efforts to deal with it. Of course, it is philosophically possible to deny the existence of disability, to consider it a fake category simply made up to oppress those so categorized, rendering special education superfluous. For example, Baglieri et al. (2011) wrote:

... it is within special education that cognitive and biological ideologies of normalcy and abnormalcy are codified and exercised—even championed for relentless methods of identifying pathology with schoolchildren in order to deliver “appropriate services” (p. 2129).

This provided a rationale for attacking special education, as they then stated, “what special education strives to enforce, Disability Studies seeks to dissolve” (Baglieri et al., 2011, p. 2930).

However, the conceptualization of disability as resulting from social oppression and nothing else—comes to a logical dead end. If disability is defined by social exclusion, or discrimination, then all victims of racial and gender discrimination would count as disabled including women, blacks, and gays, which would be an illogical conclusion (Anastasiou and Kauffman, 2012; Harris, 2000). An alternative is that the category “disability” does, indeed, exist and that some students with disabilities do, actually, have significant limitations in learning. Therefore, a special educational mechanism (i.e., special education) is a rational and needed response to these disabilities (e.g., Kauffman, 2022; Kauffman et al., 2018b).

Disability as ordinary and extraordinary diversity

Some people see disabilities as ordinary diversities or even idealize them, the “problem” being society’s unwillingness to address disabilities as ordinary differences that need to be accommodated. Disabilities themselves are not problems at all, according to this view, which emphasizes the “lived experience” of disability and claims that disability is an integral part of personhood and that a person with a disability loses identity if and when disability is lost.

Others view people with disabilities as valuable human beings, but see their specific disabilities as both extraordinary activity restrictions, not things to be considered gifts. Disabilities are restrictions in ability to perform a critical activity, such as difficulty walking, seeing, hearing, communicating, learning or problem solving (Anastasiou and Kauffman, 2012, 2013). Typically, disabilities generate special needs that should be addressed in any caring society if we want to maximize learning for students with disabilities and overcome their participation restrictions.

In this view, individuals may have characteristics that need modification. The implication of this viewpoint is that the attitude or philosophical notion that “there is nothing wrong with disabilities, it’s the rest of the world that needs changing” is a half-truth in many cases and sorely lacking in nuance when applied to all individuals with disabilities. “Normal” or “typical” is a meaningful concept, and depending on an individual’s characteristics and the capability of societal institutions to change either themselves or the individual, it will be unfair to deny the appropriate change of either. Moreover, a view that disability is never an extraordinary challenge fails to recognize the perspective of ecological psychology—that it is interactions and transactions of individuals and environments, not simply or completely a fault in one or the other, that creates a disability (e.g., see Anastasiou and Kauffman, 2013).

Those who see disabilities as extraordinary human diversity also recognize the importance of prevention, conditions that could be prevented from occurring at all if possible and prevented from progressing or worsening. Thus, prevention of accidents and diseases that cause disabilities is not a bad idea. Neither are medication, surgery, therapies, treatments, devices, and special education designed to mitigate disabilities.

Disability as predicament

Some people see disabilities as predicaments, perhaps natural parts of life but, nevertheless, not good situations to be in. Disabilities are differences from typical functioning. They definitely are not imaginary. Their recognition denotes that others care about educational performance that puts a student in a poor predicament or bad situation. Characteristics that create predicaments in developing persons are not experienced as just another kind of social identity among developing persons.

Every person modifies her or his learning behavior in school, and students with disabilities are not exceptions—they go to school to learn, not just to spend time there. Moreover, the right to learn applies to all students not just students with disabilities. We also know that many people with disabilities experience their atypical restrictions of abilities as predicaments that make life harder (Shakespeare, 2006), and this includes students with disabilities.

Special education as a response to disability

From one point of view, special education adds insult to injury—in that it is a way of needlessly identifying, separating, and ill-serving students with disabilities. From this perspective, students' disabilities are assumed not to generate special needs that should be remediated (see Pfeiffer, 2002), merely ordinary differences to be accommodated by all teachers, diversities that, like any others, are not in themselves challenges in any way. Presumably, then, students with disabilities are to be treated like all other students and, without exception, educated in the same place, in the same curriculum, and by the same methods as all other students. People with such views are vehemently opposed to special education as a response to disability. For example, as Oliver (2000), a central figure in the field of disability studies, put it, "I was and remain implacably opposed to the very existence of special education" (p. 6). In support of this view by lambasting special education as something not needed in a society properly reformed, Lipsky and Gartner (1996) wrote:

Special education plays a sorting role, both for those consigned to it and for those students who remain in general education. It limits expectations of the former, and gnarls the attitudes of the latter ... Thus, the system of special education, and the attitudes towards disability that undergird it, have harmful consequences for both those labeled "disabled" and those not.

Lipsky and Gartner (1996, pp. 767–768).

From another point of view, special education has been historically, and continues to be, necessary and effective in meeting the needs of students with disabilities, as demonstrated by recent studies (Hurwitz et al., 2019; Schwartz et al., 2019). Accordingly, it does not do the damage Lipsky and Gartner (1996) noted, and the attitudes toward disability undergirding it are helpful, not harmful (see Gerber, 2017; Hornby, 2014, 2015; Kauffman, 1981, 2022; Kauffman and Badar, 2018, 2020; Kauffman et al., 2018b; Martin, 2013; Warnock, 2010).

Labeling disabilities

Much of the criticism of special education has to do with labeling, particularly the negative implications of labels and their accompanying stigma. Concerns about labeling and stigma are not new phenomena but have been controversial for decades, and not just depending on one's view of disability. The issue of labeling has been discussed extensively for years by the first author and colleagues (e.g., Kauffman, 1989; Kauffman and Badar, 2013; Kauffman et al., 2008). Suffice it to say here that efforts to avoid labels have not worked out well when tried (e.g., Feniak, 1988). Without labels one cannot talk about things and they become unmentionable. Labels are inevitably attached to persons receiving special services, and progress in all fields of study is characterized by more specific labeling because finer distinctions are made.

Attempts to avoid labels or to use only more general, less specific labels, have not been found to be practicable.

The labels may not be those in current use for specific disabilities, but a label is necessary to designate the matter of concern. In our view of language, avoidance of labels merely makes the matter of concern unmentionable—or, ironically, all the more visible. Some have attempted to avoid labels by suggesting, for example, that "We do not believe a person *has* an intellectual disability; rather the person is *defined* by other as having the condition" (Kliever et al., 2006, p. 188). Still another tactic in attempts to avoid labels for disabilities or make them less unpleasant is using general, less specific language. Thus, the more general term developmental disability, which lumps disabilities of all kinds together, is perceived by some as more appropriate As a field of study matures, its language gets more specific, not less. Less specific language or more general terms without an increase in more specific sub-terms is a reliable indication of regression, not advances, in any field of work.

Kauffman et al. (2008, p. 363).

Intention to reduce erroneous labeling and stigma is not misguided, although efforts to do so, such as coming up with new labels or using words that apply to everyone, may not work as intended (Kauffman and Badar, 2013). Much of the anti-labeling rhetoric in education has been counterproductive. Labels need not be changed to provide better understanding of their meaning and of the individuals to whom they accurately apply. A better understanding of differences about which we can speak openly and candidly is important, and so is communication with labels people understand. Understanding that a new label means the same as the old or former label does little to reduce the stigma of the condition named. A label can clarify communication or distort it.

Controversy about the meaning of inclusion

Virtually no one believes that inclusion of diverse groups of people should not be included in a diversity of community activities. However, two questions about inclusion arise in the minds of most people: Which diversities? For a given diversity, which activities? Virtually no one suggests that inclusion of diverse groups of students should not be included in public education. The question for most people is which diversities to include. Furthermore, virtually no educators hold the view that no students with disabilities should be included in general education. The question for most educators is whether there are objective limits on inclusion of students with disabilities in general education and, if so, just what those limits should be and the conditions under which they should apply.

Ultimately, there is also the question of just what inclusion means in any activity. Inclusion could mean just being there—that physical presence is enough, that presence or exposure to something is access to it. It could be that more than just being there is important, that actual participation is required. Obviously, one cannot participate without being there, so being there is a precondition for participation. However, not all people have the ability to participate in activities that most people enjoy, and, in education, presence and exposure do not necessarily mean access (Fuchs et al., 2014).

Inclusion as location

One way of being able to tell whether a student is included in general education might be called *habeas corpus*, a “we have the body” definition of inclusion (Kauffman and Badar, 2020). This locational notion has the advantage of being literal, easily and objectively measured (is/is not in a designated classroom or location for x% of the school day), and a precondition for any other type of inclusion. Typically, any other place, even if temporary or a percentage of the school day, is called “segregated.” The “segregated” definition is applied to special education, although not typically used to describe other separation or instruction in a setting designated for particular purposes (e.g., band or music education, practice of a sport, science lab), even though these might be activities or places not including all students. We do not usually consider students to be segregated by bus route, school, or grade, even though they may be in different places depending on their residence, age, and achievement. This is partly because we understand that not all students can be included in all things and that there are both rational and irrational reasons for a student’s inclusion in any given place.

Nonetheless, some proponents of full inclusion argue that *all* students with disabilities can be appropriately taught in a single kind of place, that being the school and classroom they would attend if they had no disability. For these proponents, place is not only the central issue but the assumption is that appropriate education can and will follow placement in general education. It is assumed that we now know how to bring all educational services to students in general education and that this should be an invariant assumption in all cases (e.g., Laski, 1991; SWIFT Schools, 2020). For example, Blackman (1992) wrote, “‘Place’ is the issue ... what is being challenged is the location where ... supports are being provided” (p. 29).

Inclusion as activity

Another definition of inclusion has to do with the activity in which a student is engaged, something Kauffman and Badar (2020) call *proprium instructio*, meaning in Latin appropriate instruction. Warnock (2010), an early advocate of inclusive education, notes that students with disabilities may be instructed appropriately in a variety of settings, that engagement in appropriate instruction is more important than place of instruction and that appropriate instruction is for some children far more feasible and likely in some places than in others.

For those doubting the wisdom of *full* inclusion the primary objective is a student’s engagement in learning that is most appropriate for her or him as an individual, regardless of place. That is, the most important issue is instruction, not place (Kauffman and Badar, 2014, 2016; Kauffman et al., 2018a,b,c).

Putting instruction before place—chronologically, preparing the individualized educational program or IEP before choosing the least restrictive environment (LRE) from a full continuum of alternative placements (CAP) is not just logical but is mandated by federal law in the USA (see Bateman, 2007, 2017; Bateman and Linden, 2012).

Practical issues in inclusion: the “real world” debate

“Real world” includes policies, whether we approve of them or not. Nevertheless, the “real world” includes other realities, whether we approve of them or not. We prefer what Rauch (2021) called “the reality-based community” and what Kauffman and Farkas (2022) refer to as veracity in special education (Kauffman and Hornby, 2020; *in press*). Usually, policies can be changed more easily than can other realities. Moreover, policies can require ignoring or denying other realities. For example, a policy might call for *all* people in a political entity (such as a country or city) to be fed a nutritious diet in the absence of sufficient food to do so. In special education, we must recognize the fact that a policy may mandate the impossible because of human limitations or the nature of teaching and learning. It is also important to recognize that policies requiring people to do the impossible, or even the nearly impossible or highly unlikely for those to whom it applies, generate a variety of negative consequences, including resentment, resistance, hostility, pretense, lying, cheating, and cover-ups.

Inclusion and teacher diversity

Teachers vary along many dimensions of competence in instruction and classroom management, so if education policies are not to demand the impossible, they must consider what the typical teacher is realistically able to do. Despite promotion of inclusive education for more than 20 years, many general education classroom teachers still consider that they are unprepared to teach students with various disabilities (Hornby, 1999; Mitchell, 2019).

Training in special education has not, nor can it reasonably be expected to, prepare all of its trainees to be competent in instruction of students with all types of disabilities. Much more unrealistic is the notion of training all teachers to teach all students well.

Kauffman et al. (2020b) pointed out that preparing all teachers to teach all students makes as much sense as: all drivers being licensed to drive all vehicles, without special training; all physicians being licensed to perform all medical treatments, including examinations, prescriptions, surgeries, and other medical procedures; all patients being placed in general medical units regardless of medical condition or diagnosis; all lawyers being expected to handle all types of legal cases; all sport coaches being able to coach any sport; all teachers being prepared to teach all subjects at all levels.

Although these examples may be considered hypothetical, it should be pointed out that the Iowa Professional Teaching Practices Commission proposed, in 2014, to establish a single special education endorsement that would be applied to all levels of instruction (K-12), all levels of severity, and all disability conditions. A similar proposal put forward for a single endorsement in general education that would qualify an individual to teach anything from early childhood education to high school physics would be considered laughably outrageous! ... Such a proposal is not only unconscionable but reveals the devaluation of what special educators do and what students with disabilities deserve.

Kauffman et al. (2020b, pp. 258–259).

In the “real world” of teaching and teacher education, the need for specialization is readily recognized for most subjects of study, particularly as grade and age of student increase (e.g., music, science, math, art). The notion that special education teachers are not required for meeting the instructional needs of students with disabilities might not be merely an indication of how teacher diversity is ignored but also how little the nature of disability is acknowledged.

Inclusion and the nature of disabilities

We have previously mentioned the diversity of conditions that comprise disability—that the singular term disability can mask the diversity of conditions involved. Disabilities can involve seeing, hearing, talking, thinking, moving, emotional/behavioral health involving self and relationships with others, and other biological/organ functioning. Disabilities can involve these things in varying degrees and various combinations. Thus, disabilities differ greatly in nature and implications for teaching and learning. Among the many issues involving disabilities is what students with disabilities deserve in their education, and afterward. One must consider not only students with disabilities’ lives during their education, but also their education as preparation for life after they leave public education.

One point of view is that the most important thing for all students with disabilities is to be part of general education, not to be taught in environments or settings different from that of their age peers who are not identified as having a disability. Hence, their disability should not set them apart from other students but be seen as just another variation of human existence, demanding only accommodation to make their participation in the classroom a reality.

A different perspective is that some disabilities require acknowledgment of the need for special instruction, that such instruction may require a separate setting and special teacher, and that not all things can be taught well in the same place and by the same teacher. Moreover, students with disabilities deserve instruction from a teacher especially knowledgeable about their particular disability and skilled in teaching students with it. For example, blind students need a teacher highly skilled in teaching orientation and mobility as well as Braille, deaf students need a teacher fluent in signing, deaf-blind children need a teacher highly competent in teaching them, students with speech/language problems need a teacher highly skilled in working with speech/language deficits, and so on. From this point of view, instruction is more important than being in a class with nondisabled peers, and learning particular skills in school is highly important for students’ lives after school. Failure to become competent in the special skills required for functioning as independently as possible after the school years sets up students with disabilities for their failure of inclusion in community settings when they are adults.

Inclusion and severity of disability

Severity of disability is often a relevant variable in the matter of inclusion’s feasibility and outcomes, with greater severity of disability typically associated with lower feasibility of successful inclusion in general education. However, advocates for the inclusion of students with more severe disabilities often bemoan the fact that such students are not included as often as they should be or as often as students with other disabilities, such as learning disabilities (e.g., Agran et al., 2020; Wehmeyer et al., 2020). In trying to explain why this is inappropriate, Kauffman et al. (2020c) considered several factors related to severity. First, some students have multiple disabilities, none of which is alone severe, but the combination of conditions creates severe difficulty in learning. Second, another factor to consider is what parents, educators, and students themselves expect as the outcome of education. In some cases, it is economically and administratively convenient to place the student in a general education classroom with relatively low expectations of the student’s learning. That is, just where the student is for a given percentage of time makes little difference in what the student can do, so being in a general education classroom is of little consequence, and this might be the case for both the students with disabilities and other members of the class. In other cases, a student’s severe disability includes extremely disruptive behavior that does interfere with other students’ learning. Moreover, in many cases students with severe disabilities need to learn a great deal that is important in self-care and ability to function in the community following school, and they are very unlikely to learn these things in mainstream classrooms.

Therefore, making sweeping statements about the feasibility and desirability of the inclusion of students with severe disabilities in general education is irresponsible, all things considered. Perhaps this is especially true in the case of severe and multiple disabilities. Likely, this is one of the reasons for the USA's Supreme Court's conclusion that educators should expect that a students with disabilities should be making progress toward achieving challenging goals, rather than just being included in general education (see [Kauffman et al., 2019](#)).

Inclusion and class size

Teaching all students well, regardless of disability is perhaps possible for the typical teacher with appropriate training in general and special education when the class consists of 5 or 10 students. However, it is far more difficult for any teacher who has training in special as well a general education when the class has 20 or 30 or more students. It is extremely demanding for the most highly skilled and best-prepared teachers of more than 30 students. Probably, the typical general education class size needs to be 20 or more students for the wealthiest nations to make universal public education sustainable without massive increases in education funding. Therefore, implementing full inclusion of students with disabilities is an extraordinary task if they are to be well served. The practical, real-world problem is meeting the challenge of appropriate education for all, including not just typical human diversity (most of which has little or no implication for education) but the special and often unique learning needs of students with disabilities.

In all cases, the larger and the more learning-diverse the group of students, the more difficult the job of the teacher. In most countries, few public school classes have fewer than 20 students, and in many developing countries the typical public education class size is more than 30 students, sometimes reaching 100 students or more, making inclusion of students with disabilities extremely difficult if not practically impossible if students with disabilities are to receive appropriate instruction.

Probable success of educational inclusion, all things considered

Success in education is a relatively difficult thing to define, whether for students with disabilities or students not identified as having disabilities. However, success is usually defined more by what students learn and do in school and how they fare after school than where they go to school or in which classrooms in a particular school building or with what teachers they spend their time. When we make decisions about our own or other individuals' lives, we need to try to figure out the probabilities of both immediate and long-term consequences.
